

The India Rubber World

VOLUME LIX
October, 1918, to March, 1919

VOLUME LX
April, 1919, to September, 1919

New York:

THE INDIA RUBBER WORLD PUBLISHING CO.
1919

Vol. LXI

OCTOBER 1, 1919

No. 1

A

"A. S. T. M. Standards, 1918". (Book Review) 152	
Abbe Refractometer.....306	
Accelerator Foot-Rest, New Contrivance.....293	
Accelerators, Effect of Certain, upon the Properties of Vulcanized Rubber. (George D. Kratz and Arthur H. Flower) 485	
Report of Committee on Poisonous Nature of Some.....82	
"Accounting as an Aid to Business Profits". (Book Review) 373	
Adams, C. J., Death of.....575	
Aeronautical Exposition, The.....351	
Aeroplanes, Military.....90	
After-the-War Demand for Rubber Goods, Influences Operating on.....620	
(L. W. Atwyn-Schmidt) 620	
Air Compressors for Tires.....489	
Hydro, for Inflating Tires.....330	
Airplane Bomber Cord, Goodrich.....637	
Constitution, Rubber in. (Edgar H. Wilson) 132	
Handley-Page, Giant Tires for.....480	
Rubber Cord Shock-Absorbers "Ruso".....253	
Wheel Windshield.....637	
Akron Rubber Trade.....100, 155, 209, 263, 322, 388, 445, 507, 579, 649, 714	
Alden, Adalbert H., in War Work.....302	
John V., Death of.....513	
Alien Enemy Patents Available Under License 545	
Allan, Andrew A., Death of.....320	
Allocating German Car Rubber.....176	
Allocation, Crude Rubber for the Next Quarter.....13	
of Sulphur, The.....28	
ALWYN-SCHMIDT, L. W.—	
Influences Operating on After-the-War Demand for Rubber Goods.....620	
Our Trading Power for Rubber.....415	
American Chemical Society, Annual Meeting of.....424	
Rubber Section.....24	
Rubber Division Meeting of.....696	
American Manufacturers' Export Association, Convention of.....130	
Maritime Policy, Broad, Needed.....130	
Rubber Trade Attached.....1	
Society for Testing Materials.....(Charts) 628	
Analysis of Vulcanized Rubber. (J. A. S. Morrison) 695	
Anchorage for Motors.....307	
Andersen, E. A., Death of.....384	
Antimony Pentasulphide, Analysis.....384	
(D. Repony) 384	
Antwerp Rubber Market, The Future of the.....270	
Appleton, Captain Francis H.....(Portraits and Sketch) 128, 384, 510	
Argentine Republic, The Words "India Rubber" as a Trade-Mark in the.....(Herbert Langner) 269	
Asbestos Sheet Packing, Compressed.....489	
Automobile Pedal Cover, Adjustable.....409	
Show, New York.....(Charl) 317	
Tire Fabrics, Salvaging.....535	
Tire Treads, Some American.....147	
Automotive Engineers' Society of Adopts Standards Recommended by Tire and Rim Divisions.....498, 688	
"Auto-Seal" Inner Tube.....310	
"Avulção da Borracha e o Processo de Coagulação".....(Book Review) 31	

B

Awards, Army and Navy.....52, 102	
Azo Process Zinc Oxides.....363	
Babcock, Edward S.....(Portrait) 393	
Baffling Botany of Rubber, The.....(Editorial) 120	
Bags, Rubber-Lined and Rubberized.....566	
Baird, Robert L.....(Portrait) 124	
BARKER, KELTS COLFAX—	
The Evolution of Rubber Plantations.....354	
Balata and Rubber Enterprises in The Guianas 518	
Belting: Its Manufacture and Use. (Hancock Hashing) 418	
Calendar.....254	
Solving in English.....419	
Ball, G. W.....(Portrait) 429, 566	
New Game.....369	
Novel Rubber, Griffin.....565	
Balloon Accessories of Rubber.....637	
Fabric Sewing Machine.....253	
Banbury Dust Proof Mixer.....144	
Bario.....198	
Barry, Daniel L., Death of.....91	
Barthel Trophy Cup, "THE INDIA RUBBER WORLD".....642	
Bass Fishing, "Minnow" Bait for.....493	
Bath Outfit, Syphon, for the Soldier.....33	
Bathing Accessories, Rubber.....565	
Bag, "Jiffy-Lock".....638	
Cap, High-Grade.....565	
Battery Jar Press Vulcanizers.....635	
Bauman, H. A.....(Portrait) 639	
Beat Machine, Wire.....634	
Ring Clamping Machine.....366	
"Beaded Tip" Rubber Heel.....638	
Bed, "Balkan," Rubber Used with the.....89	
Belt Fasteners, High-Duty.....635	
Belting, Balata, Its Manufacture and Use. (Hancock Hashing) 418	
Rubber, "Test Special".....492	
BeSwan, Charles A., Death of.....(Portrait) 320	
Bias Binding, Building.....538	
Bin, Dry Compound.....538	
Binding, Building Bias.....538	
Binch, Milton, Death of.....91	
Blanchard, Harold F., Death of.....(Portrait) 91	
Polvina, Rubber in the Beni District of.....593	
Bolshevism, Antidotes for.....(Editorial) 288	
Born in Rubber to Come.....(Editorial) 119	
BOOTS AND SHOES (See Footwear).	
Foreign Import Duties on.....370	
Borneo, West Coast of.....722	
Boston Rubber Trade.....44, 99, 155, 210, 276, 323, 389, 446, 509, 578, 651, 715	
Botany of Rubber, The Baffling.....(Editorial) 121	
Both Able and Willing.....591	
Bottle Case, Rubber-Lined.....492	
Hot-Water, Folding.....492	
Rubber-Finished, Vacuum.....429	
Bourn, The Honorable Augustus O. (Portrait and Sketch) 500	
Boyer, H. S., Death of.....(Portrait) 321	
Brady, J. D., Death of.....321	
Brake, C. H., Soleinoid, for Rubber Mill Drive.....697	
Liming, "The Test-Toss".....560	
"Branit Bys and Sells, What" (Book Review) 434	
Getting Closer to.....(Editorial) 408	
Rubber Situation in.....725	
Rubber Statistics.....37, 458, 524, 666, 738	

Breck, J. H., Death of.....40	
Britain, A Friendly Message from. (Editorial) 176	
British and United States Rubber Goods Export Trade Compared, 1913-1918.....548	
Rubber Factories, Economic Revolution in.....585	
Broderick, J. Joyce.....(Portrait) 237	
Brush Cloth Stretcher.....303	
Hair, "Maid of America".....310	
Nail, One-Hand, "Limpet".....254	
Soapstone.....254	
Buckleton, Captain, and E. B. Fuiper. (Portrait) 158	
Building Bias Binding.....538	
"Bulletin des Gauthoucs".....(Book Review) 700	
"Bull's Eye" Two-Section Rubber Heel.....311	
Bunges, Edouard.....(Portrait) 476	
BUNSCOTEN, W.—	
Vulcanization without Rubber.....550	
Burrell, George W.....(Portrait) 444	
Business, Expansion of.....(Editorial) 538	

C

Cajio, Yvonne.....(Portrait) 7	
Caldwell, R. J.....(Portrait) 319	
Calendars and Souvenirs.....256, 314, 613	
Calender Adapted for Filling Molds.....30	
Balata.....254	
for Forming and Joining Rubber Sheets.....308	
for Tire Tread Stock.....87	
New Three-Roll.....697	
California, Southern, New Era for Industry in.....719	
Canada Rubber Statistics.....56, 112, 169, 223, 282, 339, 461, 532, 603, 733	
Canadian Consolidated Rubber Company, Limited, Report and Election.....506	
Import Tariff on Rubber Goods.....416	
Notes, 37, 97, 145, 213, 318, 391, 487, 506, 576, 577, 648, 711	
"Caoutchoucs, Bulletin des". (Book Review) 700	
Cap Cover and Checkerboard, Rubber.....146	
Cape, Military, for Soldier's Protection.....701	
The "Perfection".....630	
Car Heating, Steam Hose for.....630	
Carroll Black Situation, The.....250	
Carroll, Frank R.....(Portrait) 449	
Carton-Making in the Rubber Factory.....325	
Cassidy, Lieutenant James H. and Michael. (Portraits) 136	
Catalog Sizes, Standard.....(Editorial) 678	
Catalysis to Vulcanization, Application of. (André Dubuc) 242	
"Caterpillar" Truck Tire, Kelly-Springfield.....702	
Cement Cans, Non-Explosive.....365	
Charm, New Horizontal.....489	
Cements, Rubber, Determination of Settling of Lead Oxide in.....426	
Rubber.....(S. Albert Kaufman, S.B.) 613	
Census and Control of the Plantation Rubber Industry.....52	
"Ceylon Agricultural Society Year Book".....(Book Review) 484	
Chamber of Commerce, Year Ending December 31, 1917, Report of.....560	
Imports and Exports.....(Book Review) 700	
"Chemical Analysis, Technical". (Book Review) 700	
Mechanical-Technical Examination of Rubber.....(U. G. F.) 364	
Directory of the United States.....Annual. (Book Review) 90	

N4
59-60 1915-17

Engineering Catalog.....(Book Review)	152	De Hiss, Cassell.....(Portrait and Sketch)	616	From Plantation to Factory Direct.....	63
Industries, Fourth National Exposition of.....	25	Dubois, Horace.....(Portrait and Sketch)	573	Gata, Would Use Nine Million Pounds of.....	287
Patents.....27, 81, 142, 198, 300, 342, 352, 362, 363, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000

Books for Rubber Men

CRUDE RUBBER AND COMPOUNDING INGREDIENTS

REVISED AND ENLARGED *By Henry C. Pearson, F.R.G.S.*

Carefully revised and brought up to date. New chapters also have been added, covering the latest developments of the rubber industry, such as Plantation Para, Synthetic Rubber, Vulcanization without Sulphur, Organic Accelerators, Physical Testing, Analytic Methods, etc. Of special interest and value are the collections of classified practical rubber compounds grouped under the various divisions in rubber manufacture.

Price, Postpaid, \$10

RUBBER MACHINERY

By Henry C. Pearson

Without doubt the most comprehensive attempt to record the mechanics of rubber that the trade has yet seen. The book is the result of many years of experience and work on the part of the author, assisted by mechanical experts, rubber engineers and draughtsmen. All of the best American, English, German, French, and Italian rubber machinery is here described and illustrated.

TABLE OF CONTENTS ON LAST PAGE OF READING.

Both Able and Willing.

AMERICA'S income is \$352 per capita; her debt, \$65. One hundred dollars per capita would bring, \$12,000,000,000 and still leave us solvent. That is why we face the Fourth Liberty Loan with optimism and enthusiasm.

AMERICAN RUBBER TRADE ATTACKED.

CERTAIN publications in England, notably the "Financial Times" and "Truth," are saying exceedingly bitter things against the American rubber trade. Noting them, our London contemporary, "The India Rubber Journal," states the case as follows:

"The excess raw rubber importation into the United States over and above the fixed ration has not yet been satisfactorily explained, and has provided food for much unfavorable discussion and comment in market circles. The usually well-informed financial correspondent of 'Truth' this week devotes his attention to the matter, and formulates an indictment against the American rubber industry which contains the essence of the market gossip. In order to ventilate the subject we reproduce his remarks below, and may perhaps go so

far as to say that some explanation is due from the American to the British rubber industry in order that any misunderstanding may be removed, and that the cordial relations which have ruled for so long be cemented."

Before replying fully we affirm that on the part of the American rubber trade there exists the most sincere and cordial feeling toward England. Her supreme sacrifices during the past four years in the defense of her heritage and ours, are fully appreciated and will never be forgotten.

As to the "indictment" in "Truth" which "The India Rubber Journal" cites, it begins:

"It would, of course, be as absurd as it is untrue to suggest that the United States Government has willingly become a party to a scheme, the object of which is to injure the British plantation industry."

This goes without saying. Why say it?

Continuing, "Truth" says:

"But that the Government import restrictions are being used to that end by a powerful and astute body of American manufacturers I have not the slightest doubt."

No such body exists: American rubber manufacturers buy for their own companies and not as a pool. Indeed their keen competition time and time again has forced the prices up to the advantage of the planter.

Still continuing, this is presented:

"For years it has been well known to the leaders of the rubber industry that American manufacturers—the consumers of two-thirds of the crop—are envious of our ownership of the Eastern plantations."

Here is a profound lack of understanding of American psychology. Few Americans spend time envying. Nor does the American rubber man have any feeling toward those who built up the planting industry but friendly appreciation. He realizes further that the work was not done from altruistic motives, and did not complain when during the rubber shortage a few years ago the planters got from him prices close to the three-dollar mark. Those same high prices, when he was on contract work, meant great financial loss, in some cases ruin, but he felt that the planter had a perfect right to sell for what he could get, and he paid without grumbling, and furthermore without any feeling against the English.

The indictment continues:

"At times, in fact, more or less open threats have been made that sooner or later they would make an effort to capture the plantations."

How does one "capture" plantations? By purchase? A "threat" to buy, granting that any financially responsible party made it, which we doubt, is not a crime. The seller need not sell. If he does, he gets value received. Furthermore the plantations would still doubtless remain on British territory, subject to British taxes and British laws.

Further on, this sin is laid on our shoulders.

"Year after year for the past seven years the Americans, as the largest buyers, have shown their power to control the price of this commodity. By first acquiring stocks, and then for a time standing out of the market, they have repeatedly been able to force timid and impetuous growers to sell their crops at low prices."

So this is wrong, or at least unethical? One wonders if the planter ever holds his rubber for higher prices or raises prices when rubber is scarce?

Continuing, this annoying accusation is made:

"These clever American buyers no doubt welcomed—probably asked for—the restriction and licensing of rubber imports as the finest opportunity of securing cheap rubber that has ever been presented to them."

The "clever buyers" neither asked for nor welcomed the government restrictions. Indeed they protested strenuously against them, for it meant and still means great curtailment of business, a very serious matter for all.

Further says this writer:

"The absurd suggestion that the country could effectively play its part in the war and cut down its consumption of rubber from 180,000 tons to 100,000 tons was unfortunately believed in certain quarters here."

Many Americans wish the suggestion were absurd. The long list of "non-essentials" in rubber no longer to be manufactured; the stopping of automobile manufacture; the elimination of hundreds of styles of tires; the discontinuance of hundreds of styles of rubber footwear; the rule that of the 1,100 types of water bottles only three shall be manufactured, are but a few of the items that go to show that rubber manufacture, and rubber use are being curtailed. And be it noted, every division of the trade, through committees, is working hard at the problem of cutting down on rubber in every direction, and doing it with enthusiasm.

Another paragraph runs thus:

"Even now it is not too late to save the situation. Let the Rubber Growers' Association face the facts, and look below the surface of these 'restrictions' to the unfair advantage the American manufacturer is taking of war-time conditions in attempting to secure control of the plantation industry."

By all means let the Rubber Growers' Association face the facts. They are these.

1st. The excess rubber importation can be easily accounted for. It is due to Colonial shippers, amongst them some very prominent English firms, forwarding large weights of rubber without an import license regardless of the fact that one was required.

Positive knowledge is now in the possession of the War Trade Board of considerably more than 5,000 tons so shipped and some of the best known English firms are implicated.

However, when this is used as a basis by some of our English friends to insinuate American manufacturers have deceived the United States Government and are bringing in more rubber than the program calls for, then it is about time to make it clearly evident who are

responsible for the excess importations over the prescribed schedule.

Here is a statement of the actual facts.

The amount of rubber actually licensed for importation by the Bureau of Imports of the War Trade Board from May 8 to September 23 was 40,044 tons shipping weight or, after making allowances for the shrinkage allowed on Brazilian rubbers, say 36,000 tons dry weight.

Therefore, the allocation program of 100,000 tons per annum is certainly being strictly lived up to.

Any weight beyond the above amount that has been shipped after May 8, is unlicensed rubber, cannot be entered for consumption until it is licensed, and when it is, it will apply against the schedule.

In other words, where provision is made for licensing 25,000 tons during the forthcoming quarter, not all of this by any means will leave overseas points.

The War Trade Board intends that this unlicensed rubber shall be taken care of. Consequently shipments from overseas during the next three months are likely to be slender indeed, particularly as the War Trade Board is not likely to deal leniently from this date, now that their import regulations are so well known, and any offender who persists in shipping without a license is liable to find himself in an uncomfortable situation.

Assuming that the importations of crude rubber during 1917 amounted to approximately 180,000 long tons, the actual consumption during 1917, as determined by a very careful census and backed up by sworn statements from substantially all the manufacturers, indicate an actual consumption of 330,653,640 pounds or say 147,613 long tons.

Stocks on hand and in transit to the United States,

December 31, 1917.....	67,535 tons.
Stocks on hand and in transit March 31, 1918.....	87,572 tons
Stocks on hand and in transit July 31, 1918.....	77,413 tons

During August and September, the output of pneumatic tires was limited to 50 per cent of the manufacturer's 1917 production. For the forthcoming quarter of October-December, the same restriction applies and in addition thereto the manufacture of more or less non-essential articles is to be either eliminated or heavily curtailed.

It is our best judgment that the total consumption during the forthcoming quarter will not exceed 32,000 tons against 25,000 tons to be licensed.

The reduction of 7,000 tons in stock can be sustained by reason of the heavy weights on hand and in transit, as indicated.

2nd. The news of American restrictions brought about a bear market in the Far East. Some American and some English rubber manufacturers doubtless purchased largely at low figures. They will have to store the rubber in a tropical country perhaps for years, a costly proceeding. They took a risk that the planter did not wish to take.

3rd. The American rubber industry is straining every nerve to win the war. Its best plants are already on war work; its best men are in war work, thousands of its young men are in the Army. It is giving up time, money and effort to the limit and gladly.

4th. The record of the American rubber trade in its crude rubber dealings is unsurpassed for unflinching fairness. At the beginning of the war England declared an embargo on crude rubber to keep it from the Central Powers. The American rubber trade through the Rubber Association agreed to buy only for its own uses and the embargo was lifted. The Association through its committees, its information service, and its legal advisers, saw to it that this agreement was kept to the letter. It involved the expenditure of thousands of dollars, the fighting of law suits instituted by Germans, and unremitting watchfulness. The result was that in spite of Teutonic money and ingenuity, so little rubber got away that figured in percentages it would be in the hundredths of one per cent. America did it for her own manufacturers, but it accrued to the signal advantage of the British planters at a time when the German and the Austrian market was closed to them.

In conclusion, "Truth" says:

"If there is to be a fight for control, by all means let the share-holder be told. He will play his part willingly and ungrudgingly, and so far from shrinking from the struggle I shall be surprised if he does not enjoy it."

Less than one per cent of the purchasers of plantation rubber in the United States have any financial interest in plantations in British possessions. Rubber shares are not listed or known in the United States. Of the rubber manufacturers in America 99 per cent do not know whether "Batu Caves" and "Vallambrosa" are tropical diseases or African lakes. Speaking of attempts at control when a resident of Shanghai approached American rubber interests with a project to corral the shares of all of the plantation companies registered there, he received not the slightest encouragement. It did not interest them, nor does the control of any set of plantations interest the American.

We realize fully that the rubber planting industry in the Far East is the favorite child of the British Empire. In the beginning, planting methods, "wound response," tapping and coagulating, were all discovered and developed by government experts. As the industry grew it was watched, guarded, disease fought, and assistance given, to a degree hitherto unknown in agriculture. Moreover taxes on the rubber produced were kept very low, so low that the world wondered. The growth of the planting interest was largely due to the tremendous development of the motor industry, and America became by far the largest customer. For years rubber that cost the planter 25 cents a pound was sold to the manufacturer never below \$1 and for a time for more than \$2 a pound, showing profits of 300 to 600 per cent.

The actual owners of the great and profitable planta-

tions are the shareholders found in all walks in English life. That Americans for a moment thought of trying to dispossess them is a statement wholly without basis of fact and comes from those who are friends neither of the American manufacturer nor the British shareholder. It is to the distinct advantage of the American rubber trade to keep the plantation industry of the Far East in its present capable hands, and it stands ready to do whatever lies in its power to help to that end.

The financial end of planting from the beginning rested primarily and chiefly in London. Here a host of promoters launched planting projects, bought and sold rubber shares, and made much money. These men were the objectors when a few, a very few, Americans purchased plantations of their own. They alone fostered the alarm concerning the "American invasion." They also were the objectors to direct buying, say between Singapore and New York, simply because their London commission was thus cut off. From them came floods of suggestions for curtailing plantation production, for the purchase of surplus stocks, for valorization, for working agreements with Brazilian exporters, all to keep shares abnormally high. Not for one moment did they consider the interests of their big customers or attempt to insure the future of the planter by giving such advantages that it would profit the buyer to remain a customer for all time. They took everything, gave nothing. They are the friends and protectors of none. During the "rubber craze" they unloaded barren properties, as "Filisola," on English widows and orphans without qualm.

The recent attack upon Americans in the London papers emanates, not from the planter in the East, nor from the British rubber trade, but from this financial set. It is designed to bolster prices of rubber shares, and is indifferent to facts, and callous as to its effect upon American or English feeling, or to the joy it will give the Germans.

That reputable English journals should publish its untruthful screeds, and practically stand sponsor for them, is incomprehensible.

THE TWO, THREE, AND PERHAPS NINE-HOLE GOLF COURSES that may be installed in the rear of the American Army on the Western Front promise to be the sportiest in the world. What with shell craters, ruined villages, barbed wire bunkers and various other Hun hazards, real golfers will have the time of their lives. A golf ball with iron cross markings would be hit with great accuracy and vigor.

THE AKRON RUBBER WORKERS' OATH OF ALLEGIANCE.

I will stick to my job and do an honest day's work every day for the duration of the war. So help me God.

THE BRISTOL RUBBER RIOTERS' OATH OF ALLEGIANCE.

I will throw up my job or do a dishonest day's work every day for the duration of the war. So help me Gott.

LIBERTY DAY, OCTOBER 12.

BY Presidential proclamation, October 12, the 426th anniversary of the discovery of America, has been proclaimed as Liberty Day in order to stimulate a generous response to the Fourth Liberty Loan. Every community is urged to commemorate the day by patriotic addresses, parades, pageants, etc., under the direction of the nearest Liberty Loan committee.

THE FOURTH LIBERTY LOAN AND THE RAINBOW DIVISION.

The Fourth Liberty Loan drive began in New York on the evening of September 27, although the scheduled opening of the drive proper was not until the following morning, with the blowing of sirens and whistles as a preliminary to the address of President Wilson at the Metropolitan Opera House.

Previous to this, however, the Rainbow Division of the Special Liberty Loan Committee of the Rubber Trade of Greater New York held a meeting in the afternoon at the Yale Club, presided over by F. E. Titus, the secretary of the committee. Addresses were made by J. N. Gunn, chairman of the Tire Division Committee; by Secretary of War Baker, and by Mr. Sachs, of Goldman, Sachs & Co.

On the morning of September 28, flag-raising exercises were held at City Hall, while two parades started, one south from 31st street and the other north from Bowling Green.

In the afternoon, a 12-passenger Caproni "bombed" the city with a ton of circulars urging subscription to the Loan.

The total amount for which the Fourth Loan is set is \$6,000,000,000, as tentatively proposed, on which interest will be paid at the rate of 4½ per cent. New York's quota for the Fourth Liberty Loan is \$1,800,000,000, or 30 per cent of the entire amount. Over \$200,000,000 was subscribed the first day. October 19 is the closing date for the receipt of subscriptions.

Books similar to the coupon books used in the Third Liberty Loan drive will be used again in New York City, this time to have \$2-receipts affixed by the receiving banks when subscribers make their payments. Subscribers are also urged to buy registered bonds, for protection, and hold them until maturity.

Further details of participation in the Fourth Liberty Loan drive by organizations connected with the rubber industry will appear in our November issue.

WAR REGULATION OF RUBBER FOOTWEAR PRODUCTION.

The Conservation Division of the War Industries Board in conference with representatives of the manufacturers, has authorized curtailment regulations and restrictions in the manufacture of rubber and tennis footwear, to become effective September 1, on tennis lines, and January 1, on rubber footwear.

The tennis lines had in a previous order been restricted to a few colors of duck fabric, the fancy colors and some excessive heights of boots being eliminated. In rubber footwear, the new schedule is claimed to eliminate, for the period of the war, 5,500 styles of rubber footwear, but the only way in which such a number can be reached is by counting duplicate lines known under different names by the competing manufacturers, and by counting each size and width as a "style."

The order restricts the introduction of new lasts other than as required by the Government or to meet changes in leather footwear styles. The manufacture of men's hip and sporting rubber boots is to be restricted to one grade only, and all duck boots to be discontinued as far as possible. Leather insoles in all boots will be discontinued. Women's, boys' and youths'

hip and sporting boots will not be manufactured at all. The manufacture of knee boots will be discontinued.

Reductions in styles include the limiting of rolled-edge arctics and gaiters to men's sizes; and discontinuance of first-quality all-rubber gaiters, "Omaha" arctics and excluders, misses' and children's snow excluders, boys' and youths' jersey-cloth arctics; motormen's gaiters for men; plow shoes; lumbermen's high-lace duck vamp with gum uppers; all two-buckle jersey cloth gaiters; men's one-strap (instep) sandals; all plain sandals and self-acting sandals and "croquet" with fleece lining (storm patterns not included); self-acting storm patterns; Russian rubbers, low vamp Alaskas (not storm patterns); boys' and youths' Alaskas; clogs; youths' self-acting sandals; all self-acting Alaskas.

Buckle gaiters are not to be made higher than the present 4-buckle height in men's, boys' and youths', and the 3-buckle height in women's, misses' and children's. The manufacture of jersey-cloth gaiters and Alaskas authorized is to be restricted to first and extra quality. Use of flour starch or similar finish is greatly restricted; cashmerettes or so-called heavy arctics or gaiters and canvas rubber-soled shoes are not to be varnished; dyed linings, except where fleece-lined, are to be discontinued. All use of caustic soda in the manufacture of rubber footwear is to stop.

It is estimated by the Conservation Division that this program will conserve, among other things, 29,012,600 cartons; 5,245,300 square feet of lumber; 1,526,493 square feet of shipping and storage space; 10,742,517 pounds of weight (freight) or 4795 tons; 2,250,272 pounds of material that will not have to be dyed; 74,750 pounds of flour starch; 30,380 gallons of varnish; 125,300 pounds of tissue paper; 49,617 days' labor that may be diverted to more essential work.

GOVERNMENT COURSES IN EMPLOYMENT MANAGEMENT.

The Government has found it necessary to enter the field of industrial education on a large scale. War Emergency Courses in Employment Management, conducted by the Employment Management Division of the War Industries Board, under the auspices of five governmental departments, have been arranged for in nine leading universities in various parts of the country. These courses are designed to train men and women, who already have a basic experience of at least three years in industrial life and factory methods, and have therefore come in actual contact with shop problems. In these days every laborer must do the thing for which he is best fitted, and it has been proved that an experienced employment manager, in charge of all hiring and firing, comes very near to solving the labor problem. Manufacturers are expected to make the best use of the labor with which they are supplied, and it is through standardization of the services of an efficient central employment department that this is being accomplished in large plants. Employers of labor, particularly those having war contracts, are urged to suggest men or women from their own organizations as candidates. The courses run from six to eight weeks, and there are no charges, except the outlay for living expenses and about \$15 for books and supplies. Complete information may be obtained by addressing Captain Boyd Fisher, 717 Thirteenth street, N. W., Washington, District of Columbia.

The Hood Rubber Co., Watertown, Massachusetts; United States Rubber Co., New York City, and The Goodyear's Metallic Rubber Shoe Co., Naugatuck, Connecticut, were represented by students in previous courses, and among miscellaneous industries represented may be mentioned The Barrett Co., New York City, and the General Electric Co., Schenectady, New York.

MANUFACTURERS OF COMPOUNDING INGREDIENTS ASK PRIORITY.

The War Conference Committee of the Paint, Varnish and Allied Industries is presenting a memorial to the War Industries Board setting forth the claims of these industries to the right to be considered essential and thus be granted priority preference in fuel, labor and freight. Among the members of this committee well known to the rubber trade may be mentioned H. Gates for R. W. Evans of the Eagle-Picher Lead Co., Chicago, Illinois, representing the lead pigment industry; C. K. Williams of C. K. Williams & Co., Easton, Pennsylvania, and Henry C. Stewart of the Westmoreland Chemical & Color Co., Philadelphia, Pennsylvania, representing the dry paint and pigments industry; E. V. Peters of the New Jersey Zinc Co., New York City, representing the zinc oxide industry; C. L. Krebs of the Krebs Pigment & Chemical Co., Newport, Delaware, and S. B. Woodbridge of E. I. du Pont de Nemours & Co., New York City, representing the lithopane industry.

COLORS OF CANVAS SHOE FABRIC LIMITED.

The War Industries Board has decided after October 1 to limit the colors of dark fabrics for canvas shoes to the following, as represented on the Standard Color Card of America: Olive-brown, S-4856, cable No. 107, which represents the dark brown or tan.

Ecu, S-3183, cable No. 29 which represents the medium brown or tan.

All finished stocks of duck fabrics in the hands of fabric manufacturers and shoe manufacturers may be disposed of in the ordinary course of business. But on and after this date fabric manufacturers should produce for canvas shoes duck fabrics of only the colors recommended.

NEW CLOTHING BRANCH IN THE QUARTERMASTER CORPS.

The Quartermaster Corps announces the establishment of a new branch in the clothing and equipage division, which is to be known as the research and specifications branch. It will connect the procurement of supplies with their consumption and actual use, and will also pass on all specifications submitted by procurement officers. No departure from specifications in case of emergency will be made without the approval of the research and specifications branch.

The establishment of this branch is expected to prove of great value, not only to the Quartermaster Corps but also to the manufacturers and contractors who are supplying equipment for the Army.

TEXTILE DIVISION SECTIONS OF THE WAR INDUSTRIES BOARD.

What was formerly known as the supplies section of the Textile Division of the War Industries Board has been replaced by eleven sections. Following is a list of those of interest to the rubber industry, with their addresses in Washington, District of Columbia:

Rubber section, E. A. Saunders (advisory);
 Rubber goods section, A. W. Lawrence, chief, room 411, Quartermaster Corps Building;
 Cotton goods section, Spencer Turner, chief, room 39, Annex;
 Knit goods section, Lincoln Cromwell, chief, room 41, Quartermaster Corps Building.

SAVES ONE MILLION FEET OF VACUUM CLEANER HOSE.

Manufacturers of power-driven portable vacuum cleaners are cooperating with the Conservation Division of the War Industries Board by limiting their lines to not more than two models or sizes, by discontinuing less essential equipment, and by substituting other material for metal where the latter is not absolute necessary. It is estimated that these measures will result in the saving annually of 100 tons of steel, 125 tons of aluminum, five tons of brass, and 1,000,000 feet of rubber hose.

FROM A FORMER BELGIAN RUBBER OFFICIAL.

Major Leon Osterreith, formerly a prominent rubber merchant in Antwerp and delegate from Belgium to the International Rubber and Allied Trades Exhibitions of 1911 and 1914, now Belgian military attaché and chief of the Belgian military mission to this country, speaks with confidence and enthusiasm regarding the complete reorganization of the Belgian army while holding its line under fire at the front. Said he:

Without going into details, the Belgian Army has up-to-date infantry, cavalry and artillery; schools for officers and training camps for soldiers, as well as bombing, sniping, machine-gun, aviation, signaling and trench-mortar instruction centers.

The present Belgian Army, composed of six divisions, one cavalry corps, very powerful artillery of all caliber, numerous machine guns and up-to-date trench material and splendid flying corps, is stronger than ever, and impatiently awaits the order to advance.

COAL STORAGE LIMITED.

The tremendously increasing demand for coal for special war purposes in the eastern part of the country has made it necessary for the Fuel Administration to limit the amount of coal that industrial plants may carry on hand in storage in most states east of the Mississippi. That part of the bituminous steam coal schedule of particular interest to the rubber and allied non-preferred industries follows: Massachusetts, northern New York, 30 days; Rhode Island, Connecticut, eastern Ohio, lower Michigan, 20 days; southern New York, New Jersey, Delaware, eastern Pennsylvania, western Ohio, 15 days. State fuel administrators have authority to grant increased supplies in particular cases requiring special treatment, however.

STENOGRAPHERS AND TYPISTS WANTED BY GOVERNMENT.

Many stenographers and typists are still needed in the Government Offices at Washington, District of Columbia. Rubber companies can perform a patriotic service by making this known to their employees; by encouraging apt young women without the required training to undergo instruction at once, and, if possible, by assisting them in this. Full information and application blanks may be obtained from the secretary of the local board of Civil Service Examiners at the postoffice or customhouse in any important city.

DRIVE OF \$170,500,000 FOR WELFARE WORK.

With the approval of the War Department a combined non-sectarian drive for a war fund of \$170,500,000 for use in support of the seven organizations engaged in welfare work with the American expeditionary forces will begin the week of November 11. This sum will be divided according to the needs of each organization as follows: Young Men's Christian Association, \$100,000,000; Young Women's Christian Association, \$15,000,000; National Catholic War Council (including the Knights of Columbus and special activities for women), \$30,000,000; Jewish Welfare Board, \$3,500,000; American Library Association, \$3,500,000; War Camp Community Service, \$15,000,000; Salvation Army, \$3,500,000.

With the entire country behind this beneficent movement, the success of the drive may be confidently anticipated, and as in the past the rubber industry will do its full share.

RUBBER GAS BOMBS DROPPED OVER AMERICAN TRENCHES.

Interesting news items from the American army in France mention a German airplane flying over the sector northwest of Toul as having dropped rubber balls eighteen inches in diameter and filled with liquefied mustard gas. The effect of the gas was not serious, but the American troops were enraged by what they termed the "dirty warfare." These were probably the rubber-based bouncing bombs described in THE INDIA RUBBER WORLD of January 1, 1918, or a modification of them. Leather and rope were relied upon fully as much as rubber for the resiliency of the first of these German bombs, and the rubber used was, of course, either reclaimed, or synthetic and pro-

duced at great cost. After more than three and one-half years of warfare the rubber situation in Germany has become such that the production of munitions dependent on rubber will hardly become an increasing menace to the allied cause.

IMPROVED EQUIPMENT INCREASES NUMBER OF WOMEN TIRE WORKERS.

At the Morgan & Wright plant of the United States Tire Co., Detroit, Michigan, some 500 women are now employed in many departments where the work taxed the endurance of the able-bodied men who formerly did it.

Improved equipment, however, is constantly reducing the amount of physical exertion required by the various operations in tire building. For example, with the aid of a lifting jack—a

WITH THE AID OF A LIFTING JACK, WOMEN BECOME EFFICIENT TIRE-FINISHERS.

device developed from the idea of an employee—the physical effort required for the work in the finishing room has been reduced to such a degree that women are now employed on 3, 3½ and 4-inch tires.

The tires are brought into the department on trucks which are fitted with T-shaped steel uprights from which the tires are suspended. When the worker is ready to start on a new tire she approaches the loaded truck with a lifting jack. Upon turning a wheel at one side an arm is raised. This is guided under the nearest tire, lifting it off the T-shaped fixture on the truck. The lifting device, which is mounted on casters, is then pushed to the worker's bench; the tire is lowered, and transferred to the finishing bench. The plies of fabric and the gum strips are then applied by hand in the usual manner, rolled and the edges cut. The lifting jack is again used in removing the tire and placing it on a truck.

Women have completely replaced men in supplying stock to the workers in the finishing room. The coils of wire for pneumatic tire beads are made and soldered by women, also wrapped and trimmed. Many women are employed in the pocket department where pieces of fabric are taken from books about eight feet long, cut to the required length and stretched, one layer above another, over a large drum of equal circumference until a certain thickness is attained. These bands are then removed from the drum and conveyed to another department, where they are put over a tire core by men. As the books are too heavy for women to carry, men supply the workers as needed.

In other departments where women are employed the work is of lighter character. A number of women are engaged in cutting treads; several trim the uneven fabric edges from the rubber tread, while others cement the ends together; another group makes patches for repair kits; still others stamp sizes and names on inner tubes, and others work in the packing room where the

product is boxed. Numerous women are engaged as inspectors in various departments. As the finished casings are finally inspected they are sent to women who check their serial numbers and weigh each tire.

The vestibule school system of training has proved unsuccessful in the rubber industry, and it has been found preferable to train students among the other workers, as they develop and grasp efficient methods and short cuts more rapidly. Women are quicker to learn than men, and are taken out of the student class after six or seven weeks. Excepting the students, the women receive the same rate of pay as the men, but in the aggregate their earnings average slightly less.

Special rest and locker rooms are provided, to which the women may retire at any time. A matron is constantly on duty and aims to make the women feel as much at home as possible and to be with them during the luncheon hour.

WATERPROOFERS ORGANIZE TO SPEED UP GOVERNMENT WORK.

To speed up waterproofing work for the army, the waterproofers have formed an advisory body to be known as the Waterproofers' Committee of the Naval Consulting Board.

The members comprise V. G. Guinzburg, I. B. Kleinert Rubber Co., New York City; R. K. Goodlatte, T. R. Goodlatte & Son, Delaware, New York; W. B. Price, Price Fire & Waterproofing Co., Poughkeepsie, New York, and Herbert P. Pearson, general manager of the Cravenette Co., New York City, who is chairman of the committee.

SKILLED MECHANICS FOR AIR SERVICE.

The Air Service Division of the United States Army requires 4,000 skilled mechanics, between 18 and 56. Men qualified in the following trades are particularly sought: airplane mechanics, carpenters, coppersmiths, instrument men, motor cyclists, vulcanizers, blacksmiths, cabinetmakers, chauffeurs, fabric workers, truck masters, welders, propeller makers, motor mechanics, and machinists. Applications may be made any day between 8 a. m. and 5 p. m. to Lieutenant Billker, Room 902, 104 Broad street, New York City.

SALVAGE OF RUBBER AT THE FRONT.

At the Salvage Depot of American Supply Headquarters in France about 1,000 pairs of rubber boots and arctics are being salvaged daily. The salvage of all kinds of rubber articles was 99 per cent, or almost a complete saving of everything received. The value of the rubber salvaged last month was \$90,000. This includes the articles abandoned by the retreating enemy and by the Allied troops when hastily transferred and forced to leave extra clothing, etc., behind.

FIXED-PRICE CONTRACTS FOR ARMY SUPPLIES.

The War Department announces that wherever possible, fixed-price contracts will hereafter be the rule in the purchase of army supplies. In exceptional cases, where it is clearly to the advantage of the government, a cost plus fixed compensation contract will be made, subject to the approval of both the board of review of the particular supply bureau concerned and the Superior Board of Review of the General Staff.

"HYPATIA" TO AID RED CROSS.

J. H. Stedman of the Monatiquot Rubber Works Co., South Braintree, Massachusetts, has donated the "Hypatia" to the Red Cross, which will sell her and devote the proceeds to war work. Originally she was a full-rigged sloop measuring about 50 feet, with a 15-foot beam. In recent years a heavy-duty gas-engine was installed. At the beginning of the war, Mr. Stedman offered her to the Government for patrol purposes and she was temporarily accepted but later released as not needed.

SERVICE NOTES AND PERSONALS.

Dr. Lothar E. Weber, known to rubber manufacturers generally through his excellent work as consulting rubber chemist, is connected with the Conservation Division of the War Industries Board at Washington. As part of the program for conserving sulphuric acid, the Board for some time has been urging the substitution of nitre cake wherever possible. It was in furtherance of this work that Dr. Weber addressed the claimers at their meeting at Point Shirley not long ago.

Edwin H. Kidder, manager of the Boston branch of the United States Tire Co., has been given leave of absence that he may join the personnel board of the Emergency Fleet Corporation at Philadelphia. He will probably visit the various shipyards, and

later go to Paris for similar duties abroad. The United States Tire Co. will appoint a temporary manager to fill the position for the duration of the war.

Major M. C. Rector of the Medical Corps, now stationed at a base hospital in France with the American Expeditionary Forces, is a member of the executive committee of the Sterling Tire Corp., Rutherford, New Jersey. He has been decorated several times.

Major Frank R. Bacon, president of the Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, which manufactures electric-control devices, has been detailed to Chicago as Assistant Ordnance District Chief of the Chicago District, and will have under his supervision all ordnance manufacture in northern Illinois, northern Indiana, Wisconsin, Iowa, Minnesota, North and South Dakota, and Montana.

Harry W. Bacon, manager of the Detroit office of the Dural Rubber Corp., Flemington, New Jersey, has been accepted for flying commission. He received his aeronautical training two years ago in Southern California.

Yvonne Caijo is a little French orphan living at Pluvigner, in the department of Morbihan, who since 1916 has been cared for by one of the staff of THE INDIA RUBBER WORLD.

Major H. Stuart Hotchkiss, Aviation Section, Signal Corps, has been relieved from further duty under the Director of Military Aeronautics and assigned to duty under the Director of Bureau of Aircraft Production.

Lieutenant C. S. Lewis, Jr., former editor of the "Goodyear Family Newspaper," has been severely wounded in France. He is the first commissioned officer from Akron, Ohio, whose name has appeared in the casualty lists, and he fought in the famous Rainbow Division. Although in a critical condition as the result of four bullet wounds in both ankles and one thigh, a speedy recovery is hoped for.

Dr. M. M. Harrison, head of the research department, has been granted leave of absence by the Miller Rubber Co., Akron, Ohio, to accept a captaincy in the Chemical Warfare Service, National Army.

Aviator Lieutenant Don Harris, a former employee of The Goodyear Tire & Rubber Co., Akron, Ohio, has been interned in Holland for the duration of the war, following his descent for repairs, after an attack by German anti-aircraft guns, when he was unable to get back to the American lines.

Alexander Dow, tire inventor and rubber man, is a captain

in the Ordnance Department and assigned to the Western Cart-ridge Co., East Alton, Illinois, in charge of matters pertaining to production, approval of contracts, and purchase of materials for plant extension.

Rawson R. Cowen, of the E. H. Clapp Rubber Co., Boston, Massachusetts, is now preparing for war service at the Artillery Officers' Training School, Camp Zachary Taylor, Louisville, Kentucky. Mr. Cowen is the son of the late Robert Cowen, of the Boston Hose and Rubber Co. He is a graduate of Harvard University, of the class of 1916, and has been on the force of the E. H. Clapp Rubber Co. since that year. Mr. Cowen is a husky individual, well fitted to do his bit for his country. He was a football player during his college days, and for three years was a member of the All-American team.

I. R. Martin, former athletic director at The Goodyear Tire & Rubber Co., Akron, Ohio, and well-known in college circles as an athletic trainer, recently entered the Massachusetts Institute of Technology, Boston, Massachusetts, to train as a seaplane operator. He has also been a student at Harvard and at William Jewell College.

D. Warren Boyer, of Trenton, New Jersey, who has been connected with the Philadelphia branch of the Ajax Rubber Co. for the past nine years, is now a chief petty officer aboard a submarine chaser. He is stationed at Pensacola, Florida, and is on duty in the Gulf of Mexico. He enlisted a year ago after spending some time in a training school at Columbia University, New York City.

MARTYRS TO THE CAUSE OF LIBERTY.

FIRST LIEUTENANT DAVID ENDICOTT PUTNAM, America's ace of aces, whose portrait appeared in the July number of THE INDIA RUBBER WORLD, was recently killed in action in the air over Limey, France, when he was attacked by seven German airplanes. He is said to have destroyed 20 enemy machines. In one action, he shot down five German planes within half an hour. He had been cited for bravery in United States official orders a number of times, and had been awarded the Croix de Guerre by the French Government. Lieutenant Putnam was a descendant of one of the oldest American colonial families. He is survived by his mother and three sisters. Lieutenant Putnam was a member of the class of 1920 of Harvard University.

The Great War takes its toll not only at the front but right here at home as well. A peculiarly sad case was the death of Howard Stokes Boyer, son of H. L. Boyer, secretary of the Joseph Stokes Rubber Co., Trenton, New Jersey. Young Boyer, who was but twenty years old and a fine upstanding boy, full of life and patriotism, had joined the Aviation Section and was in training in Massachusetts. To use his own words, he felt that he could make his "star shine brighter in aviation than in any other branch of the service." A friend of all, a brilliant student in the chosen line, assured of quick promotion, he was stricken with influenza and died in the hospital camp. He gave his life for his country, a hero, a patriot, and a martyr to the great cause.

Four more gold stars will be added to the service flag of The B. F. Goodrich Co., Akron, Ohio. Owen Hopkins, after being wounded in France and returned to Newport News, contracted diphtheria to which he shortly succumbed. George Minford is reported to have been drowned during a sea fight, and Thomas Wallace, to have been killed in action with the Canadian forces in France, while Oscar W. Zuelsdorf, a former inspector in Department 16-A, died in July as the result of wounds received in the trenches.

EDWIN H. KIDDER.

YVONNE CAIJO.

H. S. BOYER.

Corporal Vincent Matthews Bowes, formerly a member of the organization of the Sterling Tire Corp., Rutherford, New Jersey, in Syracuse, New York, recently was killed in action in France. He was with Company M, 104th Infantry.

SALE OF BREWERS' RUBBER GOODS TO CEASE.

On December 1, 1918, twelve hundred breweries in the United States, representing an investment of \$2,000,000,000, and employing 100,000 workers, will cease brewing operations for at least the duration of the war.

The list of rubber goods that will be affected by the Government's closing order is a large one and includes brewers' hose, power and conveyor belting, solid tires, packing, special gaskets, tubing, rubber boots and aprons, bottle brushes, sealing plugs and electric insulation. As tires comprise the largest item in this list, it is of interest to note that 3,600 trucks equipped with 21,600 solid rubber tires valued at \$1,620,000 are used in this industry.

While the loss of brewers' business would appear to be imminent, the fact that many brewing plants are to be turned into cold storage plants requiring motor trucks and mechanical rubber goods, is a redeeming feature. Moreover, the effect of business loss will be mitigated by Government priority orders for solid tires and mechanical goods that are keeping the manufacturers busy at present.

SOLID TIRES AT THE FRONT.

BASE depots, repair shops, anti-aircraft sections and workshops, and tire-press units are but a part of army transport service at the front; all are vital and must be kept going at all costs if supplies and munition replenishments are to be effectively distributed. This particularly applies when extensive battle operations are imminent and during the progress of the attack. In this connection it is well to call to mind the fact that motor transports saved the city of Verdun.

Of the most important sections are those for equipping vehicle

units for removing worn tires and replacing them with new ones.

It may not be generally known that a British concern in making the tire presses used for the equipment of the motor transport

(C) British Official.

SOLID TIRES FOR BRITISH LOBBIES IN FRANCE.

branch of Uncle Sam's army. This particular press is like those used in the United States, but is stronger in various parts. The press is capable of giving 200 tons' pressure as against 150 tons in the standard press. The frame is made of stiffer material and the table is fitted with substantial guides, while a runway projecting from the center is fitted for lifting wheels and carrying them direct into the press itself, thus saving labor. ("The Commercial Motor," London.)

W. E. PALMER.

FROM a \$50 a month clerk to treasurer of the Goodyear Tire & Rubber Co., Akron, Ohio, a corporation whose sales for the past year exceeded the \$110,000,000 mark, is the record set by W. E. Palmer, whose election to treasurer of the company was announced at the last meeting of stockholders and directors. He succeeds F. H. Adams, who retired from the office after long service with the company but still remains a director.

Unlike many men who have left their native sections to seek their fortunes in distant cities, Mr. Palmer achieved his success in the county of his birth, for he was born at Hudson, Ohio, a few miles north of Akron.

He entered the Goodyear organization in 1898. Those were the days when President F. A. Seiberling could often be found in the factory, superintending its operations. Here Palmer found him bossing a gang of workmen setting up a cutting table, and asked him for a job. He was employed at a salary of \$50 a month, and his duties embraced keeping books, billing, time-keeping, etc.

Palmer worked himself step by step up the ladder of success. In the words of president Seiberling, when announcing his election at the stockholders' meeting, "Palmer has advanced from \$50-a-month clerkship to the position of treasurer by sheer merit—without a pull, other than that of hard work and real ability."

Mr. Palmer was recently notified of his election to receive the 33d degree of Scottish Rite Masonry, the highest honor that the Masonic fraternity can bestow.

(C) British Official.

BRITISH MILITARY TIRE PRESS AT THE FRONT, APPLYING A SINGLE SOLID TIRE.

wheels with new tires. As there are vast numbers of commercial vehicles in active service, there are many units solely engaged on this work. The length of life of rubber tires under the arduous conditions of running experienced in the war areas is short. The roads—for such they are called for want of a better name—play havoc with tire surfaces; and constant renewal is necessary. To effect this, mobile tire-press units are employed.

The illustrations shown herewith will give some idea of the stock of tires that is held, as well as the type of hydraulic press

W. E. PALMER.

War Service Committee of the Rubber Industry of the U. S. A.

RUBBER manufacturers, importers and dealers received the following notification, dated September 14, from the War Service Committee:

Mr. H. T. Dunn, chief of the rubber section of the War Industries Board, directed your War Service Committee to immediately prepare certain vital statistics in order to lay before him and the entire War Industries Board the present state of the rubber industry and its willingness to restrict non-essentials and so warrant a classification of the industry as a whole in such priorities as will secure necessary (a) labor, (b) fuel, and (c) transportation.

The Committee as requested went to Washington on September 11 and made the presentation. We enclose a printed copy of the statements and suggestions made to the War Industries Board.

As a result of this conference, your Committee is glad to report that the War Industries Board expressed a willingness to place on the preference list, the rubber industry on the following conditions:

A. That all manufacturers pledge themselves to agree to the restrictions and to abide by the instructions of the War Industries Board.

B. That all members of the industry follow the rules and requests of the Conservation Division of the War Industries Board.

C. That members of the industry execute a pledge and agree to exact one from their customers as to the sale and use of rubber products.

D. The pamphlet enclosed does not embody the final conclusions of that conference but with some modifications of the suggestions in the pamphlet, the War Industries Board and War Trade Board will immediately promulgate full information as to priorities, allocation of rubber, elimination or restrictions of productions and the form of pledge that will be required.

The statements and suggestions referred to in the above letter, follow:

INFORMATION AND SUGGESTIONS PRESENTED TO THE WAR INDUSTRIES BOARD BY THE WAR SERVICE COMMITTEE OF THE RUBBER INDUSTRY OF THE U. S. A.

The War Service Committee of the Rubber Industry has been informed by H. T. Dunn, chief of the rubber section of the War Industries Board, that it should as soon as possible make suggestions for the elimination of the manufacture of all articles containing rubber or reclaimed rubber which can be curtailed or dispensed with, if only temporarily, without interfering with the necessities of war and war work.

The Committee was informed that the object in asking for these suggestions was to enable the War Industries Board to place the industry on a basis which would insure priorities for the manufacture of articles which are deemed essential.

The Committee desires to point out that rubber products are *mainly supplemental and not initiative to the industrial and commercial life of the country.*

A curtailment of activities of the country will reflect a corresponding reduction in the demand for rubber goods so far as they are used for the purposes involved.

Rubber products which are complete in themselves and not component parts can be classified so far as being useful or non-useful, and the latter class is relatively so small that a curtailment or elimination would not be a serious matter to the continuation of the industry as a whole but in some cases might create a hardship upon individual concerns which specialize in the manufacture of some article or articles which would not come under the useful class.

For convenience of analysis and control the industry may be divided into the following classifications:

1. Pneumatic tires of all kinds.
 - (a) For automobiles.
 - (b) For motor cycles.
 - (c) For bicycles.

2. Solid tires.
3. Medical and surgical rubber goods.
4. Mechanical rubber goods.
5. Rubber footwear:
 - (a) Boots and shoes.
 - (b) Rubber and fiber heels and soles.
6. Insulated wire.
7. Rubber clothing.
8. Waterproof cloth.
9. Hard-rubber goods.
10. Gas defense products.
11. Aircraft materials.
12. Reclaimed rubber.
13. Miscellaneous not included in above.

The above classifications cover the entire industry and Exhibit A is appended which shows the relative importance of each branch in the consumption of rubber and reclaimed rubber; also the approximate percentage of cost of labor and power to the total cost of each group.

The Committee is informed that the Government's method of cooperating with the rubber industry will now take the form of granting priorities for rubber, other materials, labor and fuel only for useful purposes.

The Committee desires to endorse heartily this method of control and to express the belief that it can be of material help to the War Industries Board in establishing a proper balance between too much or too little restriction.

CONTROL OF INDUSTRY.

It would be impossible to enumerate the various articles produced by the industry and it seems to the Committee that the only practical method of control is to determine first the status of as many branches and individual articles as possible, and for everything else to define the *uses* for which rubber articles may be produced.

This would immediately stop production of all goods which are not upon the approved list or are not necessary for the uses which have been approved.

This ruling would form a drag-net into which would fall thousands of articles which would require classification into useful or non-useful, or, in other words, articles which will or will not be allowed to be produced in whole or in part.

The following uses are suggested for which rubber goods are a necessity and the production of which should be allowed to the extent that the various activities are allowed to operate:

1. All rubber products necessary for filling government orders.
2. Red Cross requirements.
3. Athletic goods.
4. Rubber supplies for all activities permitted whether required for finished products or for the operation of the activity.

EXAMPLES.

Railway supplies.	Coke plants.
Ship yard and ship building supplies.	Cement plants.
Supplies for factories.	Foundries.
Supplies for agriculture.	Cotton and woolen mills.
Supplies for food and feed.	Paper mills.
Mining supplies.	Tanneries.
Supplies for oil wells and refineries.	Manufacturers of leather boots and shoes.
Fire hose.	Supplies for telegraph, telephone and express companies.
Lumber production.	
Automobile manufacturers' supplies.	
Supplies for electrical industry.	

(See Exhibit B.)

A few rubber articles may be used by such a classification of industrial activities which might be dispensed with and a careful analysis must be made.

The following divisions of the industry would come under the above control of allowing rubber articles to be produced only for approved uses: mechanical rubber goods, hard-rubber goods (see Exhibit C), and miscellaneous not included in any other division.

The remaining divisions would be:

GAS DEFENSE

The Government only

AIRCRAFT.

The Government Only.

INSULATED WIRE.

This division committee of the War Service Committee of the Rubber Industry is practically the same as the Wire and Cable Committee of the Electrical Manufacturing Industry. It is suggested that the Wire and Cable Committee is better qualified to handle this branch of the rubber industry for the War Industries Board. Rubber manufacturers making insulated wire would then come under whatever regulations were determined upon, if any.

ATHLETIC GOODS.

The Committee suggests that no curtailment be placed upon the production of these goods. They form an unimportant part of the industry, but contribute largely to national health and physique.

SOLID TIRES.

Viewed broadly this branch of the industry is practically 100 per cent essential, and at present the Government requirements are taxing the production facilities to such an extent that stocks are automatically being reduced.

RUBBER FOOTWEAR.

(a) Boots and Shoes.—There are twelve manufacturers in this division and all are working on government orders to such an extent that civilian requirements cannot be supplied. Next winter will probably see a shortage of rubber footwear for civilian use; so in this division there is even greater curtailment than may be desirable.

(b) Rubber and Fiber Heels and Soles.—These goods are made from rubber and fiber compounds and replace leather. They will outwear leather at least two to one. Many millions of people are dependent upon them.

(See Exhibit D.)

EXPORT.

This is not included in the list of divisions of the industry, but the Committee understands that it is the desire of the Government to conserve and promote, wherever consistent, foreign trade—first, in order to maintain the foothold in foreign markets secured at considerable expense; second, to correct unfavorable exchange rates and to liquidate, by means of trade, unfavorable balances; and, third, to bring in gold.

If the understanding of the Committee is correct, it would appear desirable to continue uninterruptedly the export of rubber products subject to the control of the War Trade Board. A ruling is therefore requested with reference to export business.

RECLAIMED RUBBER.

This branch of the industry is entirely dependent upon rubber manufacturers for its existence. It is composed of several independent units and reclaiming departments of rubber manufacturers.

Any curtailment in production of rubber goods will automatically curtail production of reclaimed rubber.

The Committee desires to point out that the use of reclaimed rubber in the manufacture of rubber goods is one of the most important items of technique in the industry. Economy and competition are sufficient incentives for its use, and any further attempt to force its consumption would result in unsound practice.

RUBBER CLOTHING.

A large percentage of the production of rubber clothing is taken over for the needs of the Government, and plans for standardization of what is made for civilian use are now under way. Waterproof clothing, being used as a protection from the elements, comes under relatively the same class as rubber footwear, although the demand is not so great, nor are the stocks in the country so small.

MEDICAL RUBBER GOODS.

The principal articles produced under this classification in volume of production are hot-water bottles, fountain syringes,

and surgeons' gloves. The production of surgeons' gloves at the present time is very largely for the use of the Medical Departments of the Army and Navy.

There are numerous other articles under this general classification, all of which are essential for the sick-room or necessary to the health and well-being of the people, but in no one item is the production of unusual volume. The production of water bottles and syringes has been along rather extravagant lines, owing to the large variety of styles and types manufactured, but this number has been greatly reduced, as per report filed with the Conservation Division.

WATERPROOF CLOTH.

Aside from hospital sheeting, which is used in all hospitals and in many homes, the greater part of the production of waterproof cloth goes into the various lines of industry, where it is cut up and used in manufacturing articles of common use. Several examples are as follows:

Tobacco Trade.—Waterproof sheeting is used for covering, sweating, curing and handling tobacco, and is also used in making aprons for the production of machine-manufactured cigars and cigarettes.

Piano and Organ Trade.—Various qualities of waterproof and air-tight cloth are manufactured for small and large bellows of player-pianos, as well as for organs.

Cameras.—Light-proof rubber-coated cloth is used for extension bellows in cameras, also for focusing purposes.

Automobile Toys.—Automobile-top material is manufactured in large quantities for the production of new tops for automobiles, and in small quantities for repairs and replacements of old tops.

Hat Trade.—A limited quantity of rubber-coated material is used by hatters for the forming of straw and felt hats.

Engraving and Printing.—Rubber-coated cloth is used in printing establishments wherever fine engraved printing is done, such as bank notes and stock certificates, and a considerable quantity is used by the government printing works.

Cutting Trade.—A limited quantity of light-weight, waterproof material is used for the manufacture of small articles, such as nursery sheets, diapers, dress-shields, acid sleeves, money-bags, etc. It is also used for the manufacture of children's bath tubs.

Proofers.—A large quantity of cloth is waterproofed for the use of manufacturers of mackintosh clothing who have no rubber mills.

PNEUMATIC TIRES.

This branch is the most important in the industry. It is suggested that, for the purpose of allocation and priorities, casings and tubes be considered as one article. Demand will automatically regulate a balanced production, as one is useless without the other.

The War Service Committee understands that it is desired to curtail pneumatic tire production to the lowest point which will still preserve the structure of the industry. In this connection it is to be noted that the production of tires in the present volume is of recent origin and is represented by many units varying from large to medium and small. Roughly classified it may be stated that there are five large tire manufacturers, seven medium-sized tire manufacturers, and about 100 small tire manufacturers.

The daily production based on 265 working days for 1917 was, for so-called large, from 9,800 to 21,600 tires per day; for the so-called medium, from 1,300 to 3,600 per day; for the so-called small, from 10 to 1,000 per day.

Many of the so-called small manufacturers are not yet well-established and are dependent upon maximum capacity to meet obligations. Any drastic curtailment will threaten the existence of some of these so-called small units and this is accentuated by the possibility that they will be unable to compete for government business. It is therefore apparent that it would not be ethical for the War Service Committee to recommend a minimum point of production which would still preserve the structure of the industry, inasmuch as this would actually provide for the ruin of some of the units, and the Committee does not feel it should be asked to take this responsibility.

Now that a rubber section of the War Industries Board has been established, the Committee feels it should no longer be asked to make recommendations, but should confine its work to procuring and presenting information asked for, as well as keeping the Board fully posted on current conditions of the industry.

The War Industries Board is now in a more favorable position than the Committee to form an intelligent opinion regarding the

amount and regulation of future allocations in respect to the manufacture of pneumatic tires.

The committee presents the following information to guide the Board in determining the necessary production to provide for present and future needs to conform with the general policy controlling the use of automobiles.

BASIS—50 PER CENT OF 1917 PRODUCTION.

	Total number produced.	Number per day, (365 days per year)
Production, 1917	23,300,000	63,835
50 per cent curtailment	12,650,000	34,657
Present consumption, estimated	24,500,000	67,123
Net loss per day		32,466
Manufacturers' stocks on hand July 31, 1918		4,500,000
Dealers' stocks on hand July 31, 1918, estimated		3,000,000

Total stocks on hand July 31, 1918, estimated..... 7,500,000

At the above rate of production and consumption, stocks will theoretically last 231 days, making complete exhaustion the latter part of March, 1919.

A shortage throughout the country will be felt during the middle of November, 1918.

Unbalanced stocks require a considerable anticipation of above dates.

BASIS—50 PER CENT OF 18 MONTHS' PRODUCTION. (JANUARY 1, 1917, TO JUNE 30, 1918.)

	Total number produced.	Number per day, (365 days per year)
18 months' production	37,050,000	67,671
50 per cent curtailment	18,525,000	33,835
Present consumption, estimated	24,500,000	67,123
Net loss per day		33,288
Manufacturers' stocks on hand June 30, 1918		4,500,000
Dealers' stocks on hand June 30, 1918, estimated		3,000,000

Total stocks on hand June 30, 1918, estimated..... 7,500,000

At the above rate of production and consumption stocks will theoretically last 225 days, making complete exhaustion the middle of March, 1919.

A shortage throughout the country will be felt during the first part of November.

It is pointed out that, long before the point of exhaustion is reached, there will be a shortage throughout the country. Due to the various sizes and styles with which cars are equipped and the necessity of carrying these at available points in order to give prompt delivery and thus prevent owners from hoarding private stocks, it is estimated that when total stocks of manufacturers and dealers reach a minimum of 4,000,000 tires a shortage will be felt. This figure includes tires in transit which would total at least 750,000 to supply the country's present requirements.

The stock requirements would, of course, become less in relation to the restricted use of automobiles.

EXHIBIT A.

Article	Pounds of Rubber consumed in 1917.	Pounds Reclaimed Rubber consumed in 1917.	Percent- age of 1917 Cost.	Percent- age of 1918 Cost.

Grand total.....	330,653,644	195,968,188		

EXHIBIT B.

MECHANICAL RUBBER GOODS.

This branch of the industry is very important and includes many thousands of articles of great diversity. They may be generally subdivided into the following classifications:

1. Belting.
2. Rubber hose.
3. Packing.
4. Cotton rubber-lined hose.
5. Mats, matting, and tiling.
6. Molded goods.
7. Heels and soles.
8. Friction tape.
9. Jar rings.
10. Rubber thread.
11. Tubing.
12. Lathe and hand-made goods.
13. Springs and bumpers.
14. Miscellaneous.

The following is a partial list of articles used for essential purposes:

SUPPLIES FOR FACTORIES, MACHINERY AND MATERIALS NEEDED IN PRODUCTION AUTHORIZED BY THE GOVERNMENT.

Rubber thread for elastic web manufacturers and airplane shock absorber cord; blankets for printing presses; all kinds of packings, hose, belting, moulded goods and rubber-covered rails for coke plants, cement plants, stone quarries, powder plants, steel mills, nitrate plants, foundries, cotton and woolen plants, tanneries, paper mills, and all classes of essential factories.

SUPPLIES FOR AGRICULTURE.

Thresher belts, Suction hose, Water hose, Packings, Steam hose.

SUPPLIES FOR FOOD AND FEED.

Grain elevators, mills, packing houses, etc., and also supplies for canning and preserving.

Elevator belts, Conveyor belts, Hose, Packings, Jar rings, Squiggle rubber, Transmission belts, Hog-scraper belts, Molded goods, Valves, Hot-water tubing, Large number of special molded articles for sugar plants.

RAILWAY SUPPLIES.

Air-brake hose, Car-heating hose, Engine and tender hose, Fire hose, Air and pneumatic tool hose, Steam hose, Water hose, Axle dynamo belting, Air-brake gaskets, Throttle packing, Air-pump packing, Piston and pump packing, Sheet packings, Valves, Squirt hose, Step treads, Tiling.

SHIPS, SHIPYARDS AND SHIP BUILDING SUPPLIES.

Packings, Deck hose, Air and pneumatic tool hose, Steam hose, Suction hose, Oil hose (for oil burning boats), Fire hose.

MINING SUPPLIES.

Elevator belts, Conveyor belts, Transmission belts, Air hose, Steam hose, Water hose, Vanner belts, Packings, Valves, Molded goods, Fire hose.

SUPPLIES FOR OIL WELLS AND REFINERS.

Driller belts, Transmission belts, Oil hose, Water hose, Suction and discharge hose, Steam hose, Stuffing box rings, Packer rubbers, Swab rubbers, Cups, Pipe rings, Packings, Fire hose.

LUMBER.

AUTO MANUFACTURERS' SUPPLIES.

Belts, Hose, Radiator hose, Molded goods, Brake lining.

LEATHER BOOT AND SHOE MANUFACTURERS.

Belting, Cements, Coated fabrics, Hose, Packings.

ELECTRICAL INDUSTRY.

Tape, Matting, Hard-rubber goods, Belting hose and packings.

SUPPLIES TO TELEGRAPH, TELEPHONE AND EXPRESS COMPANIES.

Tape, Hard-rubber goods.

EXHIBIT C.

HARD RUBBER.

This division of the industry is separate and distinct from the others, inasmuch as its products represent an entirely different finished material.

The important items are:

1. Batteries, including submarine type and battery cars.
2. Sheet and pipe for electrical purposes.
3. Hard-rubber combs.
4. Hard-rubber accessories for medical and surgical goods.
5. Pipe bits.
6. Fountain-pen parts.
7. Automobile accessories.
8. Buttons.
9. Pipes for conducting chemicals.
10. Receptacles for powder mills.
11. Buckets for handling acids in chemical plants and powder mills.

In addition to these there are thousands of miscellaneous articles made from hard rubber which cannot be classified.

Production of the following hard-rubber articles has already been discontinued by the principal manufacturers:

- | | | |
|------------------------------|------------------------|--------------------|
| Buttons. | Boat and Navy buttons. | Crochet tools. |
| Hairpins. | | Funnels. |
| Pen holders. | | Caustic holders. |
| Brush backs. | | Pocket flasks. |
| Bowling balls. | | Tumblers. |
| Rouge balls. | | Corkscrew handles. |
| Book pin balls. | | Beer scrapers. |
| Cigar and cigarette holders. | | Beer shakers. |
| Rulers, inkstands. | | Drug scoops. |
| Stethoscopes. | | Suppositories. |
| Ear trumpets. | | Thimbles. |
| Teething rings. | | Tinting shuttles. |
| Match boxes. | | Embroidery rings. |
| Letter cases. | | |

EXHIBIT D.

RUBBER HEELS AND FIBER SOLES

Uses.—Rubber heels and fiber soles are used in large quantities both in the construction of new shoes and in the repair of old ones.

In the past year approximately 75,000,000 pairs of rubber heels and 15,000,000 pairs of fiber soles were made and used in the United States alone.

Both are used as a substitute for leather and both give longer service than leather soles and heels, respectively.

Rubber heels and fiber soles are used largely by working people who stand upon their feet or walk while at work.

Economies.—Shoes either made or repaired with rubber heels and fiber soles are cheaper to the consumer than with the corresponding leather parts.

Fiber soles have enabled the manufacturer of shoes to market a serviceable product at a price within the reach of the laboring classes.

Fiber soles and rubber heels will wear from two to three times as long as corresponding parts made from leather employed for similar purposes.

Consequently there is great economy both in labor and in materials in the making and use of rubber heels and fiber soles, for where heels and soles of leather are used they must be removed and the shoes repaired two or three times as often as where the rubber heels and fiber soles are used.

Moreover, there is an initial saving in labor, since it requires less labor to produce rubber heels and fiber soles than to produce heels and soles of leather.

About fifty per cent of the labor used at present in the producing of rubber heels and fiber soles is female labor.

There is a saving in steel (approximately 50 per cent) in the use of the rubber heel. First, because it requires fewer nails to attach the rubber heel and, second, because a set of nails employed to attach a rubber heel is used through the lives of two or three sets of nails employed in attaching any other type of heel.

Rubber heels and fiber soles are made largely from by-products, including reclaimed rubber, which by-products do not occupy ship space. There is an adequate supply of such by-products available which is not needed in the production of more essential articles.

If the production of rubber heels and fiber soles was curtailed, leather would be substituted therefor and additional leather for this purpose must be imported and, therefore, occupy much ship space.

Fiber soles and rubber heels are waterproof and eliminate the necessity of using rubber shoes on many occasions.

Precedent.—Great Britain has found it advisable to encourage the making and use of rubber heels and fiber soles during the war.

THE RUBBER INDUSTRY AN ESSENTIAL INDUSTRY OF CLASS C-4.

THE following letter of September 23 was addressed to the rubber industry by the War Service Committee:

The War Service Committee of the Rubber Industry of the United States presented a brief on Wednesday, September 11, 1918, to the Priorities Division of the War Industries Board with the object of having the industry placed upon the preference list.

The Priorities Division has expressed its confidence in the good faith of the rubber industry and subject to its agreement to fulfill all requirements of the War Industries Board and the War Trade Board has designated it an essential industry with a classification of Class C-4.

A bulletin, issued by the War Industries Board, designating the classification of the rubber industry and a pledge to be signed by each manufacturer is printed below. No manufacturer will be entitled to priorities on the preference list until he has signed the pledge.

WAR INDUSTRIES BOARD PRIORITIES DIVISION.

CIRCULAR No. 24.

For All Rubber Manufacturers:

The Priorities Division of the War Industries Board, after conference between your representatives and the undersigned with other representatives of said board, has considered the status of your industry and its claims for general preferential treatment and for priorities in obtaining its supply of materials, and has reached the following conclusions:

A large part of the production of your industry is essential either for direct or indirect government uses or to supply necessary industrial and civilian requirements. There is, however, no element of non-essentiality in that production which, in the national interest, should be eliminated. The representatives of your industry have signified to the Priorities Division the willingness of the industry as a whole to strip itself of this non-essential production, and in its remaining production to limit itself to supplying only the current demand and to adopt all practical measures which will tend to conserve supplies of raw material, labor, fuel and transportation.

The Priorities Division believes that if the production program herein-after outlined is adopted and faithfully observed, the industry as a whole may be said to be engaged in essential production under conditions entitling it to preferential treatment in obtaining its supply of fuel, labor and transportation, and to proper priority assistance in obtaining its supplies of material.

1. Each manufacturer shall conserve to the greatest possible extent raw materials, fuel and labor; shall eliminate from its production unnecessary or undesirable types, sizes and styles of articles; and particularly shall observe and comply with any conservation plan promulgated or approved by the Conservation Division of the War Industries Board.

2. Each manufacturer shall limit its production of each and every article and item of production as near as may be to the current demand therefor; shall carry stocks only in amounts reasonably necessary to insure the supplying of current demand; and shall refrain from hoarding fuel, raw material, finished or semi-finished products.

3. Each manufacturer shall limit its items and amounts of production for export to those covered by export licenses issued by the War Trade Board.

PRODUCTION PROGRAM.

4. Each manufacturer shall, as soon as possible after completing the manufacturing of such articles already in production, enter a conservation program production all articles for which there is no essential use; and particularly all articles designated or listed as of such a character by the War Industries Board.

5. No manufacturer shall produce or deliver any article except for such essential uses as may be designated from time to time by the Priorities Division of the War Industries Board, and for the present to include the following general uses:

(a) For filling government orders and orders of the American Red Cross.

(b) For furnishing supplies to railroads operated by the United States Railroad Administration.

(c) For furnishing necessary supplies to preferred industries and plants, as the same are included from time to time upon the preference list of said Priorities Division.

(d) For furnishing necessary supplies to those industries not listed upon said preference list, but preferred by the said Priorities Division to be more or less essential and allowed to operate under a curtailed or controlled production program; but only to the extent that such supplies are necessary to enable any such plant to produce in accordance with such programs for civilian clothing and footwear (boots and shoes, rubber and fiber heels and soles), to the extent of the present production and to supply current demands only; the manufacturer to encourage conservation and economy by the public.

(f) For medicinal and sanitary purposes; to the extent of the current demand, and subject to strict compliance with any conservation program announced or approved by the Conservation Division of the War Industries Board.

6. Using as a basis the production of automobile casings and tubes under six inches for the eighteen months ended June 30, 1918 (not including those invoiced on direct government orders during the same period), the maximum production of such articles by each manufacturer for the last three months of 1918 is fixed at 3 1/2 of 50 per cent (measured both

by number of units and amount of rubber consumed, of the average annual production for said eighteen months' period; provided, however, that such maximum production may be referred to the extent of such casings and tubes produced on direct orders from any agency of the United States Government; and provided further, that in the case of tire manufacturers whose plants were not in operation previous to January 1, 1917, but were in operation previous to January 1, 1918, such maximum production of each such manufacturer for the last three months of 1918 shall be one-half of 50 per cent of its production during the period January 1, 1918, June 30, 1918.

7. No restriction will at the present be placed upon the production of tires, or of any other articles, which are described in the preceding paragraph hereinabove, except that such production shall not exceed that required to fill the current demand therefor.

8. Each manufacturer is authorized to fulfill all further or other orders of the War Industries Board with respect to the character and extent of its production and operations.

Each manufacturer shall file with the Priorities Division of the War Industries Board a pledge in writing in the form following:

MANUFACTURER'S PLEDGE.

Priorities Division, War Industries Board,
Washington, D. C.

The undersigned hereby pledges itself (1) not to use, nor so far as lies within its power permit to be used, any products of its manufacture now in or which may hereafter come into its possession or control save (a) for essential uses as that term has been or may be defined or applied from time to time by the Priorities Division of the War Industries Board, or (b) under permits in writing signed by the proper authority of such Priorities Division;

(2) that it will make no sale or delivery of any such products to any customer for resale until such customer has filed with it a similar pledge in writing and has agreed to sign by the Priorities Division of the War Industries Board, or (b) under permits in writing signed by the proper authority of such Priorities Division, provided that the provisions of this subdivision of this pledge shall not, until further order of the War Industries Board, apply to casings and tubes under six inches; (3) that it will in all things strictly observe and comply with the production program for rubber manufacturers as the same is set out in Circular No. 24 issued by said Priorities Division under date of September 21, 1918, and will limit and curtail its production, eliminate the production of non-essential articles, and adopt conservation measures and programs as provided in such circular; (4) that it will observe and comply with all other or further rulings and orders of the said Priorities Division; (5) that it will make and render at such time or times as may be designated any report or reports concerning its production and activities as may be required by said Priorities Division or the Rubber Section of the War Industries Board.

10. No manufacturer shall make, sell or deliver any of its products to any customer for resale until such customer has filed with it a pledge in writing in the following form:

CUSTOMER'S PLEDGE.

To—

The undersigned hereby pledges itself not to use, nor so far as lies within its power permit to be used, any products of its manufacture now in or which may hereafter come into its possession or control save (a) for essential uses as that term has been or may be defined or applied from time to time by the Priorities Division of the War Industries Board, or (b) under permits in writing signed by the proper authority of such Priorities Division, provided that the provisions of this pledge shall not, until further order of the War Industries Board, apply to casings and tubes under six inches; further that it will make no sale or delivery of such product to any customer for resale until such customer has filed with the undersigned a pledge similar to this.

The Priorities Division, believing that compliance with the above program will eliminate from the production of rubber manufacturers substantially all non-essential production, and accepting the assurances of the representatives of the industry that such program will be immediately put into effect, has certified the industry as a preferred industry, giving it a rating as Class A. This action will entitle the industry to preferential treatment in its supply of fuel, labor and transportation in the manner and to the extent explained in the "Foreword" to Preference List No. 2 issued by said Priorities Division as Circular No. 10 under date of September 3, 1918.

If, however, any rubber manufacturer shall (a) fail to file within fifteen days from the date of this circular its written pledge as hereinabove provided, or (b) fail to observe and comply with any of the terms or conditions of the program as herein set out, or with any of the terms or conditions of its written pledge, said manufacturer will forfeit its right to preferential treatment under the general listing of the industry as a whole, and will be certified to the various government agencies controlling the supply of labor, fuel and transportation as having so forfeited its right to preferential treatment.

By virtue of the placing of the industry on the preference list rubber manufacturers will be entitled, in obtaining their supply of raw materials or finished or semi-finished products, to an automatic Class C rating under the terms and provisions of Circular No. 4 of the Priorities Division of the War Industries Board, dated July 1, 1918. If for any reason the manufacturer is unable to obtain materials under such automatic Class C rating, he may apply to the Priorities Committee for a higher rating by priority certificate and said application will be given proper consideration.

The Priorities Division relies upon the rubber industry and each and all of the plants constituting the same to faithfully and conscientiously observe and comply with all of the terms of the program herein set out, and to cooperate, wholeheartedly with the government in its efforts to conserve and most effectively use the nation's supply of material, labor, fuel and transportation, to the end that the full strength of the nation may be mobilized in the most effective manner and directed into the most effective channels for the accomplishment of the one great common purpose—the winning of the war.

Yours very truly,

JOHN B. PARKER,
Priorities Commissioner.

Washington, D. C., September 21, 1918.

R. K. P. QUESTIONNAIRE NO. 19-M.

This questionnaire was sent to manufacturers September 23, at the request of the War Trade Board for information as to the stocks of crude rubber, including jelutong (poutianak), gutta percha, balata and gutta siak, on hand and in transit, as of September 30, 1918; the answered questionnaire to be returned immediately to Irving B. Ferguson, C. P. A., 511 Fifth avenue, New York City.

W. S. C. QUESTIONNAIRE NO. 18.

At the request of the War Industries Board, this questionnaire was sent to manufacturers September 23, for information respecting the quantity of crude rubber, dry weight (not including balata, guayule, gutta percha, gutta siak and jelutong), used in the production of specified classes of goods during July, August and September, 1918; the answered questionnaire to be returned by October 10 to Irving B. Ferguson, C. P. A., 511 Fifth avenue, New York City.

Crude Rubber Allocation for the Next Quarter.

ON September 23, manufacturers and importers were informed by the Committee on Rubber and Kindred Products that the War Trade Board had adopted the following allocation program for October, November and December:

The quantity of rubber for which import licenses may be issued by the War Trade Board during the forthcoming October-December period has been fixed at 25,000 tons, and will be allocated in accordance with the following program to manufacturers who have furnished the information called for in Questionnaires 2, 14, 16 and 17, and who conformed to the plan of curtailment of production during the months of August and September announced by the War Trade Board, and who subscribed to the limitations and regulations governing the production and sale of rubber products as promulgated, or as may be hereafter promulgated, by the War Industries Board.

For the purpose of allocation, the consumption of crude rubber will be considered under three classes, as follows:

CLASS A. That used in the manufacture of products invoiced during October-December, 1918, on direct government orders. (Direct government orders are to include direct orders from all railroad, express, telephone and telegraph companies under Government contract, direct Red Cross and direct Allied Government orders.)

CLASS B. That used in the manufacture of automobile casings and tubes under six inches in diameter.

CLASS C. That used in the manufacture of all other rubber products.

Rubber will be allocated in the three classes upon the following basis:

CLASS A. Rubber consumed in this class will be replaced in full, if reported in the usual manner. Manufacturers will have the privilege of making advance applications for an amount not to exceed 75 per cent of the amount to which they will be entitled. The remainder is to be replaced when the exact amount has been determined.

CLASS B. (1) To manufacturers whose plants were in operation previous to January 1, 1917, on the basis of 1/18 of their 18 months' rubber consumption in said class from January, 1917, to June, 1918, inclusive, after deducting from said consumption all rubber consumed in direct government orders falling within said class, invoiced January-June, 1918, inclusive.

(2) To manufacturers whose plants were not in operation previous to January 1, 1917, but were previous to January 1, 1918, on the basis of 1/6 of their rubber consumption in said class from January, 1918, to June, 1918, inclusive, after deducting from said consumption all rubber consumed in direct government orders falling within said class, invoiced during January-June, 1918, inclusive.

(3) To manufacturers whose plants were not in operation previous to January 1, 1918, but were previous to July 1, 1918, a quantity equal to their average monthly rubber consumption in said class during the period of operation to August 1, 1918, after deducting rubber consumed in direct government orders falling within the said class, invoiced during said period.

CLASS C. Manufacturers will be allocated a quantity equal to 3/4 of their consumption of rubber in said class during April, May and June, 1918, after deducting rubber consumed in direct government orders falling within said class, invoiced during April, May and June, inclusive.

The amount allocated to each manufacturer will be entered in the books of the Bureau of Imports of the War Trade Board, which amount can be checked against by the manufacturers in the form of allocation certificates, which will be furnished by the Bureau of Imports.

These allocation certificates will be issued to each manufacturer in two forms. Twenty-five per cent of the allocation will be limited to rubber from Central and South America. Seventy-five per cent of the allocation will be for rubber from any source. Manufacturers must utilize the full amount of their allocation before any allocation will be made them in succeeding periods.

FEATURES OF THE NEW PLAN.

The Committee on Rubber and Kindred Products states that this plan of allocation differs from the preceding ones in certain respects, amongst them as follows:

(1) Variable percentages are allotted against the three classes of A, B and C and the basis of allocation is predicated on different periods in lieu of 1917 consumption as heretofore employed.

(2) Rubber used in filling indirect government orders will not be replaced. We are informed that so much difficulty has been experienced in tracing same to a government order that the plan is not workable. We are also advised that nearly all government orders for rubber goods consuming substantial quantities of rubber will be placed direct by the Government from now on, and this along with the increased allocation in Class C, which class represents the characters of goods largely used in indirect business, should simplify this problem.

(3) All figures of consumption upon which the allocation is predicated will be the amount of rubber used in other than government business. Rubber used in direct government orders heretofore has been fully replaced as it will be during the forthcoming period.

To such manufacturers who were not in receipt of an allocation covering the August-September period, we are informed by the War Trade Board that if they are entitled to one for the forthcoming quarter that they will receive in addition thereto a proportionately greater amount to cover the aforesaid two months.

RULES GOVERNING PRODUCTION AND SALE OF RUBBER PRODUCTS.

The War Service Committee notified all manufacturers on September 23 as follows:

We are instructed by the War Industries Board to advise that the following limitations and regulations governing production and sale of rubber products will be in effect for the period of October-November-December, 1918:

1. Manufacturers may produce during the period all classes of rubber products (except automobile casings and tubes under six inches) considered essential and for essential use, in accordance with rules and regulations that may be issued from time to time by order of the Priorities and Conservation Divisions of the War Industries Board, in quantity measured by rubber consumed equal to but not in excess of 100 per cent of their April-May-June (1918) rubber consumption in all products (except automobile casings and tubes under six inches) not including said consumption rubber consumed in all products invoiced during said period on direct Government orders.

This limitation of 100 per cent in production does not apply to government business or essential medical or surgical goods which may be produced to meet requirements.

2. Tire manufacturers whose plants were in operation previous to January 1, 1917, may produce during the period, exclusive of direct government orders, up to but not in excess of 1/12 of the automobile casings and tubes under six inches manufactured by them during the period from January, 1917, to June, 1918, inclusive (not including in said production automobile casings and tubes under six inches invoiced on direct government orders during the period January, 1918, to June, 1918), measured by rubber consumed and by number produced.

3. Tire manufacturers whose plants were not in operation previous to January 1, 1917, but were in operation previous to January 1, 1918, may produce during the period, exclusive of direct government orders, up to but not in excess of 1/4 of the automobile casings and tubes under six inches manufactured by them during the period January to June, 1918 (not including in said production automobile casings and tubes under six inches invoiced

on direct government orders during the period January to June, 1918), measured by rubber consumed and by number produced.

4. Tire manufacturers whose plants were not in operation previous to January 1, 1918, but were in operation previous to July 1, 1918, may produce each month during the period, exclusive of direct government orders, a quantity equal to but not in excess of 50 per cent of their average monthly production of automobile casings and tubes under six inches manufactured by them for the period of operation to August 1, 1918, measured by rubber consumed and by number produced.

5. Manufacturers producing more than one class of rubber products will be privileged to increase their consumption of rubber in any of the several classes of products listed as essential (except automobile casings and tubes under six inches) provided they make a corresponding decrease in the consumption of rubber in other classes so that their total consumption shall not be greater than herein provided for.

6. Manufacturers having raw materials on hand, and who are unable to operate their plants on basis of restricted output herein or hereafter provided will be allowed a greater production to avoid so far as possible manufacturing loss in the liquidation of their inventories. All such cases should be reported direct to the Rubber Section of the War Industries Board, accompanied by a sworn statement of the quantity of rubber (specifying green weight), of fabric in pounds (specifying types), and of other principal materials on hand. Tire manufacturers should state the minimum schedule of casings and tubes on which their plants can be operated without manufacturing loss.

AN IMPORTANT LETTER TO TIRE DEALERS.

The War Service Committee, in the following letter dated September 23, requests the hearty cooperation of all tire dealers:

This committee has frequently had brought to its attention newspaper and trade paper reports and other rumors, erroneous either in whole or in part, as to the attitude of the Federal Government as expressed by the War Industries Board in connection with the manufacture, distribution and purchase by users of pneumatic automobile tires.

In connection with the National War Program, the Government desires to help and induce all to save unnecessary investments in materials, unnecessary expenditures of money, and unnecessary employment of man power.

In connection with our National Shipping Program, they also desire to save shipping space.

Such limitations as have been made in the importation of supplies of crude rubber have been made after a full conference with the Industry, and it is the intention of the War Industries Board to endeavor to see that the country has all that it *actually* needs without any undue hardship. Any restriction in the production of pneumatic tires is made after a review of the conditions of stocks in the hands of manufacturers throughout the country, for the purpose of reducing unnecessary investments in tires, and you are urged to aid in this national program and to prevent, so far as lies in your power, any hoarding of tires, or any unnecessary purchase or anticipation of needs on the part of distributors, dealers or owners.

We are confident that a sufficient quantity of tires will be manufactured to take care of the cars that will be permitted to be run, and the Government will look with stern disfavor on any profiteering or hoarding and will act accordingly.

Your patriotic and hearty cooperation is solicited.

AMERICAN SOLDIERS THANKFUL FOR CONTRIBUTIONS TO SMOKE FUND.

Twenty postal cards have been received from American soldiers over there, expressing their appreciation of the tobacco obtained through the contributions of the Rubber Association of America, Inc., to the Smoke Fund.

SALES OF CIVILIAN RUBBER CLOTHING TO BE MINIMIZED.

In view of the constantly increasing demands for war goods, the United States Rubber Co. has requested its branch managers to keep sales of rubber clothing for civilian purposes at the minimum.

RUBBER AND BALATA EXPORTS FROM PANAMA.

During 1917, the exports of balata from Panama amounted to 563,198 kilos, value \$513,263, while the quantity of rubber shipped totaled 31,579 Kilos, value \$60,576.

THE ECONOMIC VALUES OF CRUDE RUBBER IMPORTS.

ACCORDING to information obtained by the Committee on Rubber and Kindred Products, crude rubber has advantages in gross import values, cubical storage, dollar values and dead weights, as compared with other import commodities.

The total tonnage of crude rubber shipped by the Pacific route is shown in the following tabulation:

From:	CALENDAR YEAR. 1917.	JANUARY. 1918.
British East Indies	195,325,015	15,299,675
Dutch East Indies	59,689,895	6,316,601
Totals	255,014,910	21,616,276
Totals	113,846	9,650

The value of these imports in United States dollars is shown below:

From:	CALENDAR YEAR. 1917.	JANUARY. 1918.
British East Indies	\$113,480,370	\$8,216,439
Dutch East Indies	36,671,226	3,397,655
Totals	\$150,151,596	\$11,614,094

The relative percentage of rubber tonnage on the Pacific to the total tonnage is obtained by the following calculations:

Crude rubber, on the average, will store about 30 pounds to the cubic foot. Reducing the tonnage of rubber imports at Pacific ports to units of 100 cubic feet by dividing the total pounds by 3,000, the following cargo space units are obtained:

	CALENDAR YEAR 1917.	JANUARY, 1918.
Rubber cargo tons	85,005	7,205
Total Pacific tonnage	2,333,140	256,948
Per cent of rubber tonnage to total tonnage	3.6	2.8

The values in United States dollars of Pacific Coast imports follow:

	CALENDAR YEAR. 1917.	JANUARY. 1918.
Total imports	\$539,335,640	\$51,663,273
Rubber imports	150,151,596	11,614,094
Per cent of rubber imports to total imports	28	22.1

Therefore, in 1917 rubber occupied only 3.6 per cent of the total tonnage, but represented in value 28 per cent of the total imports on the Pacific coast. For the month of January, 1918, the corresponding percentages were 2.8 and 22%.

The money value of crude rubber in a unit of cargo space as compared with other commodities, shows an advantage in favor of rubber. For this purpose nine out of twenty-nine of the principal commodities imported in January and February, 1918, representing 198,835 long tons, value \$96,155,357, were taken for comparison. The nine products, including rubber, totaled 76,448 tons, value \$47,901,094, nearly 50 per cent of the 29 commodities in both tons and values.

The following table gives the merchandise values of these commodities to one cargo space unit of 40 cubic feet:

COMMODITIES	VALUE IN DOLLARS IN 40 CUBIC FEET.	EXCESS VALUE OF RUBBER.	PER CENT OF EXCESS VALUE OF RUBBER.
Rubber	\$685.20	---	---
Tea	187.20	\$498.00	72.6
Burlaps	171.60	513.60	299
Manila fiber	139.20	546.00	392
Coffee	87.00	598.20	688
Peas	79.20	606.00	765
Gunnies	56.16	629.04	1,120
Nitrates	41.48	643.72	1,552
Copper	1,334.24	649.04	49

The advantage in favor of rubber is shown in the following graphs that illustrate the relative cubical contents, the dollar values and dead weights for the nine commodities.

CARGO SPACE VALUES

ILLUSTRATING THE RESPECTIVE VALUES PER 40 CUBIC FEET AND THE PERCENTAGES OF EXCESS VALUE OF RUBBER OVER THE OTHER COMMODITIES.

VALUES & DEAD WEIGHTS

ILLUSTRATING THE FACT THAT THE DOLLAR VALUE OF RUBBER EXCEEDS THE WEIGHT WHILE IN ALL OTHER CASES THE WEIGHT EXCEEDS THE DOLLAR VALUE.

TON VALUES

ILLUSTRATING THE DIFFERENT TON VALUES.

Specifications for Pneumatic Tires and Tubes Adopted by the Motor Transport Corps.

THE Pneumatic Tire Division of the War Service Committee of the Rubber Industry of the U. S. A. and representatives of the Motor Transport Corps of the War Department, held a meeting September 10 in Washington, District of Columbia, the following being present:

TIRE DIVISION—Paul W. Litchfield, chairman; E. H. Broadwell, vice-chairman; A. G. Partridge, W. O. Rutherford, G. C. Weston, Seneca G. Lewis, H. L. McClaren, O. R. Cook, J. S. Broughton, W. O'Neil, J. E. Baum, O. L. Weaver, W. W. Duncan, and M. L. Hemmway, secretary.

MOTOR TRANSPORT CORPS—Major Kalb and Sergeant Wells. J. Newton Gunn, J. W. Thomas, G. M. Stadelman, S. P. Thatcher, W. E. Pfeiffer and A. R. Gormley were also present.

The result of this meeting was the adoption of the following specifications by the Motor Transport Corps:

SPECIFICATIONS FOR PNEUMATIC MOTORCYCLE TIRE CASINGS, SIZE 28 BY 3.

SECTION 1. GENERAL.

(1) **GENERAL.** (a) Pneumatic, motorcycle tire casings manufactured in accordance with this specification shall be of fabric construction of the size known as 28 by 3.

(b) The tire must give satisfactory service under a load of 325 pounds, when inflated to 40 pounds per square inch.

(c) Tires to be free from all defects and fully guaranteed as to material and workmanship.

(d) Tires shall be of the standard commercial non-skid design of the manufacturer furnishing the same. In case of a manufacturer using more than one non-skid tread design, selection of the design must be adopted at the option of the Motor Transport Service. A small section of the tire shall be submitted for approval before contract is let.

(e) The tires shall be plainly marked with manufacturer's name, serial number and size of each marked with either tag or label in color of red, white or blue which will denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year. Years to be designated by square, triangle and round labels or tags or labels to be approximately two inches in diameter.

(f) As soon as possible it is desired that all tires be marked with the equivalent millimeter sizes as recommended by the Society of Automotive Engineers.

(g) **TIRE.** All tires manufactured in accordance with this specification shall be of the clincher type, designed for the standard S. A. C. clincher motorcycle C. C. rim of the size 28 by 3.

(h) **CONSTRUCTION.** (a) Splices on first ply of fabric shall be gum strapped.

(b) Carcass of tire shall consist of at least four separate plies of tire duck with friction coat on two sides and skim coat on one side applied on a 45-degree base. The gage of one ply frictioned on two sides and skim coated on one shall be at least .043-inch. Each ply shall have not more than two splices which must be at least seven inches apart measured on the circumference of the tire. The splices in the tire shall be at least inches apart when measured on the circumference of the tire.

(c) All fabrics must be square woven (23 by 23) from the long-staple cotton weighing 17½ ounces to the square yard with an allowable variance of one ounce or minus per cent.

(d) All fabric must be thoroughly dried according to standard manufacturing practice, before it is started through the operations of rubberizing.

(e) The usual methods of inspection used by tire companies in commercial practice to discover defects in each roll of fabric shall be employed. The following tests shall be used to determine the strength of the fabric. All fabric shall be tested in a standard testing machine to determine the tensile strength. The distance between the grips on the machine shall be approximately 3 inches. To determine the warp strength, three samples shall be cut transversely to determine the filler strength. The samples shall be prepared in the following manner: unraveled to 23 yards (1-inch width), bent under standard dry and immediately test it in machine. The results must show a tensile strength of not less than 165 pounds per inch for either warp or filler.

(f) Reads shall be constructed with a rubber core filler as in standard commercial practice.

(g) One chain strap of square woven fabric weighing not less than 8 ounces per square yard shall be used. The chain strap shall extend outward on each side of the tire at least ½-inch from the channel of the bead.

(h) There shall be a cushion of rubber compound applied over the fabric which shall be wider than the tire. The minimum gage of this cushion shall be .0325-inch.

(i) Over the cushion there shall be a single breaker strip of open-weave fabric such as is in standard commercial practice, coated on both sides with a rubber compound having the physical and chemical properties of a nature to form a perfect union between the cushion and tread when the cure is effected. This breaker strip shall have a minimum width of 1½ inches.

All sections for approval must be sent to Lieutenant George B. Wells, Engineering Division, Motor Transport Corps, 358 Union Station, Washington, District of Columbia.

*As done in tread test.

Breaker shall be made from long-staple cotton and shall weigh not less than eight ounces per square yard.

(1) The tread of the tire shall not be less than ¼-inch thick in center, each of which shall be the minimum thickness for the part of the tread under the middle of the non-skid portion.

(2) The stowall of the tire shall have a minimum thickness of .043-inch.

(3) **PHYSICAL MEASUREMENTS AND TESTS.** (a) The cross sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. C. shall be less than 2.15-16 not less than 3.3 inches.

(b) Tire shall be capable of withstanding water pressure of 250 pounds per square inch without apparent injury. This test to be made at the discretion of the inspector.

(c) The strength of the union between the plies of fabric shall average 18 pounds or more per inch, using the standard friction test.

(d) The strength of the union between the breaker and tread and between the breaker and cushion shall average 28 pounds or more per inch, using the standard friction test.

(e) The strength of the union between the cushion and plies shall average 16 pounds or more per inch, using the standard friction test.

(f) The strength of the union between the sidewall and plies shall average 12 pounds or more per inch, using the standard friction test.

(g) Ray manufacturers, bidding for Government orders for government business, must be prepared to meet the following testing conditions:

(1) No tires are to be given consideration by the Government unless the company submitting the bid tenders an affidavit stating that they maintain and properly check up tests on cars to properly test their pneumatic tire products and that these cars deliver an average of 2,000 tire miles weekly.

(2) The cars, speeds, loads and road conditions must be such that the tires are properly tested and the Government may appoint an inspector to see that the conditions are complied with.

(3) A successful bidder must supply an affidavit before delivering any tires to the Government stating that the tires to be delivered are practically duplicates in construction and material of tires which he has previously tested and a sufficient number of tires satisfactory to the Motor Transport Service, at least six tires, have averaged on the rear wheels at least 4,000 miles.

(4) **LINING.** The inside of each tire shall be properly lined in accordance with the standard practice of tire manufacturers.

(5) **FLAPS.** Each tire casing shall have a flap cemented into the inside of the casing in accordance with the standard commercial practice.

(6) **S. COMPOUNDS.** (a) Tread—The tread shall be made from and have the characteristics of a compound containing at least 65 per cent by volume of the best quality vulcanized rubber. Content of sulphur shall not exceed 8 per cent by weight of new rubber used. Compound shall be free from ingredients known to the rubber trade as "oil substitutes" or "acidic materials" or "acidic compounds." The tread rubber shall be 2,600 pounds per square inch and shall have an elongation of not less than 450 per cent (2 inches to 11 inches). The set shall have a maximum of 25 (2000 pounds to 10 inches) elongation for 10 minutes, using a 1-inch sample with 10 minutes' rest before measuring.

(b) Friction and Cushion—These shall be made from and have the characteristics of a compound containing at least 75 per cent by volume of the best quality vulcanized rubber. Content of sulphur shall not contain more than 8 per cent by weight of new rubber used.

(c) Sidewalls—The sidewalls shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality new wild or plantation rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used. Reclaimed rubber to the extent of 15 per cent of the total compound is allowable, but the amount and kind must be declared by the manufacturer. The minimum tensile strength of the sidewall rubber shall be 1,500 pounds per square inch with a minimum elongation of 450 per cent (2 inches to 11 inches) and a maximum set of 25 per cent. The compound shall be free of ingredients known to the trade as "oil substitutes."

(d) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: If the manufacturer desires to use sulphur-bearing mineral fillers, thereby causing the total sulphur content to be over 8 per cent, the weight of the rubber, he may do so, but shall submit for analysis a sample of the finished vulcanized stock. Such stock shall not show a sulphur content in the acetone extract of over 8 per cent of the weight of new rubber used.

(e) The Motor Transport Service reserves the right to make any inspection, test or analysis necessary to insure the product meeting all requirements of this specification.

(f) The casing shall be spirally wrapped according to standard practice and properly labeled on the outside showing size, type and name of manufacturer, and marked with either tag or label in colors of red, white or blue which will denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year; years to be designated by square, triangle and round labels or tags or labels to be approximately two inches in diameter. Tires shipped for original equipment of cars shall be packed as specified by customer. In the case of overseas shipments, the specifications covering this shall be applied.

SPECIFICATIONS FOR PNEUMATIC MOTORCYCLE TIRE CASINGS, SIZE 29 BY 3½.

SECTION 1. GENERAL.

(1) **GENERAL.** (a) Pneumatic motorcycle tire casings manufactured in accordance with this specification shall be of fabric construction of the size known as 29 by 3½.

(b) The tire must give satisfactory service under a load of 400 pounds, when inflated to 45 pounds per square inch.

(c) Tires to be free from all defects and fully guaranteed as to material and workmanship.

(d) Tires shall be of the standard commercial non-skid design of the manufacturer furnishing the same. In case of a manufacturer using more than one non-skid tread design, selection of the design to be adopted is at the option of the Motor Transport Service. A small section of the tire shall be submitted for approval before contract is let.

(e) The tires shall be plainly marked with manufacturer's name, serial number and size of the tire, and marked with either tag or label in colors of red, white or blue, which will denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year. Each tire shall be marked with square, triangle and round labels or tags—tags or labels to be approximately two inches in diameter.

As soon as possible it is desired that all tires be marked with the equivalent millimeter sizes as recommended by the Society of Automotive Engineers.

(f) All tires manufactured in accordance with this specification shall be of the clincher type, designed for the standard S. A. E. Clincher motorcycle CC rim of the size 28 by 3.

(g) CONSTRUCTION. (a) Splices on first ply fabric shall be gum stripped. (b) Carcass of tire shall consist of at least four separate plies of tire duck with friction coat on two sides and skim coat on one side applied on a 45-degree bias. The gage of one ply frictioned on two sides and skim coated on one shall be at least .045 inch. Each ply shall be marked with more than two splices which must be at least 7 inches apart measured on the circumference of the tire. The splices in the tire shall be at least 3 inches apart when measured on the circumference of the tire.

(c) All fabric must be square woven (23 by 23) from the best quality long-staple cotton, weighing 17½ ounces to the square yard with an allowable variance of plus or minus 3 per cent.

(d) All fabric must be thoroughly dried according to standard manufacturing practice before it is started through the operations of rubberizing.

(e) The usual methods of inspection used by tire companies in commercial practice to discover defects in each roll of fabric shall be employed. The following tests shall be used to determine the strength of the fabric. All fabric shall be tested in a standard testing machine to determine the tensile strength. The distance between the grips on the machine shall be approximately 3 inches and the separation of the jaws shall be at the rate of 20 inches per minute. Six samples shall be cut from each roll in such a manner as to be representative of the entire roll. Three samples shall be cut longitudinally to determine the warp strength and three samples shall be cut transversely to determine the filler strength (unravel to 23 yards (1-inch width), heat until sample is "bone dry" and immediately test it in machine. The results must show a tensile strength of not less than 165 pounds per inch width for either warp or filler.

(f) Beads shall be constructed with a rubber core filler as in standard commercial practice.

(g) One chafing strip of square woven fabric weighing not less than 8 ounces per square yard will be used. The chafing strip shall extend upward on each side of the tire at least ¾-inch from the channel of the bead.

(h) There shall be a cushion of rubber compound applied over the fabric which shall be wider than the breaker. The minimum gage of this cushion shall be .10 inch.

(i) Over the cushion there shall be a single breaker strip of open-weave fabric, such as is used in standard commercial practice, coated on both sides with rubber compound having a minimum thickness of .05 inch.

(j) A nature to form a perfect union between the cushion and tread when the cure is effected. This breaker strip shall have a minimum width of 2½ inches.

Breaker shall be made from long staple cotton weighing not less than eight ounces per square yard.

(k) The tread of the tire shall not be less than 5/16 inch thick in the center, ¾-inch of which shall be the minimum thickness for the part of the tread under the middle of the non-skid portion.

(l) The sidewall of the tire shall have a minimum thickness of .050 inch.

4. PHYSICAL MEASUREMENTS AND TESTS. (a) Cross sectional diameter of each tire, according to standard commercial practice, shall be within 1/16 inch of the S. A. E. shall not be less than 3.4 nor more than 3.6 inches.

(b) Tire shall be capable of withstanding water pressure of 275 pounds per square inch without apparent injury. This test to be made at the discretion of the inspector.

(c) The strength of the union between the plies of fabric shall average 18 pounds or more per inch using the standard friction test.

(d) The strength of the union between the breaker and tread and between the breaker and cushion shall average 25 pounds or more per inch using the standard friction test.

(e) The strength of the union between the cushion and plies shall average 16 pounds or more per inch using the standard friction test.

(f) The strength of the union between the sidewall and plies shall average 12 pounds or more per inch using the standard friction test.

5. ROAD TEST. (a) Any manufacturer, bidding on orders for government business, must be prepared to meet the following testing conditions: (1) Two tires to be tested on a road test. The bidder must submit a statement to the company submitting the bid tenders an affidavit stating that they maintain and properly check up tests on cars to properly test their pneumatic tires, and that these cars deliver an average of 2,000 tire miles weekly.

(2) The cars, speeds, loads and road conditions must be such that the tires are properly and properly tested. The company may appoint an inspector to see that the above conditions are complied with.

(3) A successful bidder must supply an affidavit before delivering any tires to the government stating that the tires to be delivered are practically duplicates in composition and material of the tires which he has previously tested properly and a sufficient number of tires satisfactory to the Motor Transport Service, at least six tires, have average on the rear wheels at least 2,000 miles.

6. LINING. The inside of each tire shall be properly lined in accordance with the standard practice of tire manufacturers.

7. CARCASS. The carcass of each tire is to be constructed on the inside of the casing in accordance with the standard commercial practice.

8. COMPOUNDS. (a) Tread—The tread shall be made from and have the characteristics of a compound containing at least 75 per cent by volume of the best quality new wild or plantation rubber. Content of sulphur shall not exceed 8 per cent weight of new rubber used. Compound shall be free from ingredients known to be injurious to the tire.

The minimum tensile strength of the tread rubber shall be 2,600 pounds per square inch and shall have an elongation of not less than 450 per cent (2 to 11 inches). The set of the tread shall be less than 1/16 inch (2 to 10 inches when elongated for 10 minutes using a 2-inch sample with 10 minutes' rest before measuring).

(b) Friction and Cushion—The cushion shall be made from and have the characteristics of a compound containing at least 75 per cent by volume of the best quality new wild or plantation rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used.

(c) Sidewall—The sidewall shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality new wild or plantation rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used.

The amount and kind must be declared by the manufacturer. The minimum

tensile strength of the sidewall rubber shall be 1,500 pounds per square inch with a minimum elongation of 450 (2 to 11 inches) and a maximum set of 25 per cent as done in tread test. Compound shall be free from ingredients known to the rubber trade as "oil substitutes."

(d) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

9. INSPECTION. The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(a) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(b) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(c) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(d) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(e) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(f) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(g) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(h) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(i) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(j) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(k) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(l) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(m) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(n) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(o) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(p) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(q) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(r) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(s) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(t) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(u) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(v) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(w) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(x) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(y) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(z) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(aa) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(ab) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(ac) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(ad) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(ae) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(af) The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

(ag) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be 8 per cent of the weight of the new rubber, he may do so, but shall submit for analysis a sample of the finished tire, vulcanized stock. Such stock shall not show a sulphur content in the acetone extract in excess of the weight of new rubber used.

(b) Tires shall be capable of withstanding water pressure of 300 pounds per square inch without apparent injury. This test to be made at the discretion of the inspector.

(c) Strength of the union between carcass and fabric shall average 18 pounds or more per inch, using the standard friction test.

(d) Strength of the union between breaker and tread and between breaker and cushion shall average 25 pounds or more per inch, using the standard friction test.

(e) Strength of the union between sidewall and plies shall average 10 pounds or more per inch, using the standard friction test.

(f) Strength of the union between cushion and plies shall average 16 pounds or more per inch, using the standard friction test.

5. Road Test. (a) Any manufacturer, bidding on orders for government business, must be prepared to meet the following testing conditions:

(1) No tires are to be given consideration by the Government unless the company submitting the bid tenders an affidavit stating that they manufacture and properly ship their products to the Government under pneumatic tire products and that these cars deliver an average of 8,000 tire miles weekly.

(2) The cars, speeds, loads and road conditions must be such that the tires are properly tested and the Government may appoint an inspector to see that the above conditions are complied with.

(3) A successful bidder must supply an affidavit before delivering any tires to the Government stating that the tires to be delivered are practically duplicates in construction and material of tires which he has previously tested properly and a sufficient number of tires satisfactory to the Motor Transport Service, at least six tires, have averaged on the rear wheels at least 4,000 miles.

6. LINING. The inside of each tire shall be properly lined in accordance with the standard practice of tire manufacturer.

7. FLAPS. No flaps shall be supplied.

8. COMPOUNDS. (a) Tread. The tread shall be made from and have the characteristics of a compound containing at least 65 per cent by volume of the best quality of new wild or plantation rubber. Content of sulphur shall not exceed 8 per cent by weight of new rubber used. The compound shall be free from ingredients known to the rubber trade as "oil substitutes." Minimum tensile strength of tread rubber shall be 2,600 pounds per square inch and shall have a maximum of 25 per cent (400 per cent of 2 to 10 inches) elongation for 10 minutes, using a sample with 10 minutes' rest before measuring.

(b) Friction and Cushion—These shall be made from and have the characteristics of a compound containing at least 65 per cent by volume of the best quality of new wild or plantation rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used.

(c) Sidewall. The sidewall shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality of new wild or plantation rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used. Reclaimed rubber to the extent of 15 per cent by weight of total compound is allowable, but the amount and kind must be declared by the manufacturer. Compound shall have a minimum tensile strength of 1,500 pounds per square inch and a maximum elongation of 450 per cent (2 to 11 inches) and a maximum set of 25 per cent. The compound shall be free from ingredients known to the rubber trade as "oil substitutes." Minimum tensile strength of sidewall rubber shall not exceed 8 per cent of the weight of new rubber used, except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the compound to deliver 8 per cent of the weight of new rubber, he may do so, but shall submit for analysis a sample of the finished unvulcanized stock. Such stock shall not show a sulphur content in the acetone extract of over 8 per cent of the weight of new rubber.

9. INSPECTION. The Motor Transport Service reserves the right to make any inspection, test or analysis necessary to insure the product meeting all requirements of this specification.

10. PACKING. All tires shall be spirally wrapped according to standard practice and properly labeled on the outside showing size, type and name of manufacturer, and marked with either tag or label in colors of red, white or blue, which shall denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year; years to be designated by square, triangle and round labels or tags, tags or labels to be approximately 2 inches in diameter.

(c) As soon as possible it is desired that all tires be marked with the equivalent millimeter sizes as recommended by the Society of Automotive Engineers.

11. TYPE. All tires manufactured in accordance with this specification shall be of the type known as straight standard S. E. A. straight side rim of the size 32 by 3 1/2 or 33 by 4 new standard rim.

12. CONSTRUCTION. (a) Splices on the first ply of fabric shall be gum stripped.

(b) Carcass of tire shall consist of not less than five or more than six separate plies of tire duck, with friction coat on two sides and skim coat

on the sides, applied on a 45-degree line. The case of one ply frictioned on two sides and skim-coated on one shall be at least .045-inch. Each ply shall have not more than two splices which must be at least 7 inches apart measured on the circumference of the tire. The splices in the tire shall be at least 3 inches apart when measured on the circumference of the tire.

(c) All fabric must be square woven (23 by 23) from the best quality Sea Island. Exception long staple cotton laces may be used, weighing not more than 17 1/2 ounces to the square yard, with an allowable variance of plus or minus 3 per cent.

(d) All fabric must be thoroughly dried according to standard manufacturing practice before it is started into the operations of rubbering.

(e) The usual methods of inspection used by tire companies in commercial practice to discover defects in each roll of fabric shall be employed. The following tests shall be used to determine the strength of the fabric. All fabric shall be tested in a standard testing machine to determine the tensile strength. The distance between the grips on the machine shall be approximately 3 inches and the separation of the jaws shall be at the rate of 20 inches per minute. Six samples shall be cut from each roll in such a manner as to eliminate any unnecessary waste of material. Three samples shall be cut longitudinally to determine the warp strength and three samples shall be cut transversely to determine the filler strength. The samples shall be prepared in the following manner: unravel to 23 yards (1-inch width), heat until sample is "bone dry" and immediately test it in machine. The results must show a tensile strength of not less than 180 pounds per inch width for either warp or filler.

(f) Beads shall be constructed with wire strands in the same manner as in the standard commercial practice. Tensile strength tests for wire strands as used by the individual tire manufacturers for the construction of beads will be satisfactory in so far as they are sufficient to preclude any chance of a bead stretching or blowing off the rim when under pressure.

(g) The chafing strip, of the same width as the tread, not less than 8 ounces per square yard shall be used. The chafing strip shall extend upward on each side of the tire at least 1 inch from the heel of the bead.

(h) There shall be a cushioning compound applied over the entire surface of the fabric which shall be wider than the breaker. The minimum gage of this cushion shall be .050-inch.

(i) Over the cushion there shall be at least one breaker strip of open-weave fabric, of the same width as the tread, not less than 8 ounces per square yard, on both sides with a rubber compound having the physical and chemical properties of a nature to form a perfect union between the cushion and tread of the tire. The sidewall shall be effected. This breaker strip shall have a minimum width of 2 1/2 inches.

(j) Breaker shall be made from the best quality Sea Island or Egyptian cotton or the physical equivalent, and shall weigh not less than 10 ounces per square yard.

(k) The tread of the tire shall not be less than 3/4-inch thick at the center, 1/2-inch of which shall be the minimum thickness for the part of the tread nearest the heel of the bead.

(l) The sidewall of the tire shall have a minimum thickness of .050-inch.

PHYSICAL MEASUREMENTS AND TESTS. (a) Cross sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. L. shall be not less than 4 inches.

(b) Tire shall be capable of withstanding water pressure of 300 pounds per square inch without apparent injury. This test to be made at the discretion of the inspector.

(c) Strength of the union between plies of fabric shall average 18 pounds or more per inch, using the standard friction test.

(d) Strength of the union between breaker and tread and between breaker and cushion shall average 25 pounds or more per inch, using the standard friction test.

(e) Strength of the union between sidewall and plies shall average 10 pounds or more per inch, using the standard friction test.

(f) Strength of the union between cushion and plies shall average 16 pounds or more per inch, using the standard friction test.

5. Road Test. (a) Any manufacturer, bidding on orders for the government business, must be prepared to meet the following testing conditions:

(1) No tires are to be given consideration by the Government unless the company submitting the bid tenders an affidavit stating that they manufacture and properly ship their products to the Government under pneumatic tire products and that these cars deliver an average of 8,000 tire miles weekly.

(2) The cars, speeds, loads and road conditions must be such that the tires are properly tested and the Government may appoint an inspector to see that the above conditions are complied with.

(3) A successful bidder must supply an affidavit before delivering any tires to the Government stating that the tires to be delivered are practically duplicates in construction and material of tires which he has previously tested properly and a sufficient number of tires satisfactory to the Motor Transport Service, at least six tires, have averaged on the rear wheels at least 4,000 miles.

6. LINING. The inside of each tire shall be properly lined in accordance with the standard practice of tire manufacturer.

7. FLAPS. A flap of the size 33 by 4 shall be furnished with each tire, as in standard commercial practice.

8. COMPOUNDS. (a) Tread. The tread shall be made from and have the characteristics of a compound containing at least 65 per cent by volume of the best quality of new wild or plantation rubber. Content of sulphur shall not exceed 8 per cent by weight of new rubber used. The compound shall be free from ingredients known to the rubber trade as "oil substitutes." Minimum tensile strength of tread rubber shall be 2,600 pounds per square inch and shall have a maximum of 25 per cent (400 per cent of 2 to 10 inches) elongation for 10 minutes, using a 2-inch sample with 10 minutes' rest before measuring.

(b) Friction and Cushion—These shall be made from and have the characteristics of a compound containing at least 65 per cent by volume of the best quality new wild or plantation rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used.

(c) Sidewall. The sidewall shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality of new wild or plantation rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used. Reclaimed rubber to the extent of 15 per cent by weight of total compound is allowable, but the amount and kind must be declared by the manufacturer.

(d) Compound shall have a minimum tensile strength of 1,500 pounds per square inch and a maximum elongation of 450 per cent (2 to 11 inches) and a maximum set of 25 per cent.

All sections for approval must be sent to Lieutenant George B. Wells, Engineering Division, Motor Transport Corps, 358 Union Station, Washington, District of Columbia.

and a minimum elongation of 450 per cent (2 to 11 inches) and a maximum set of 25 per cent. The compound shall be free from ingredients known to the rubber trade as "oil substitutes".

The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used, except as follows: if the manufacturer desires to use sulphur-bearing mineral fillers, thereby causing the total sulphur to be over 8 per cent of the weight of new rubber, he may use up to 10 per cent, but shall submit a sample of the finished unvulcanized stock. Such stock shall not show a sulphur content in the acetone extract of over 8 per cent of the weight of new rubber used.

INSPECTION. The Motor Transport Service reserves the right to make any inspection, test or analysis necessary to insure the product meeting all requirements of this specification.

10. PACKING. All tires shall be spirally wrapped according to standard practice and properly labeled on the outside showing size, type and name of the manufacturer, marked with either tag or label in colors of red, white or blue, which will denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year; years to be designated by square, triangle and round labels or tags, tags or labels to be approximately 2 inches in diameter. Tires shipped for original equipment of cars shall be packed as specified by customer. In the case of overseas shipments, the specifications covering this shall be applied. The compound shall be free from ingredients known to the rubber trade as "oil substitutes".

SPECIFICATIONS FOR PNEUMATIC AUTOMOBILE TIRE CASINGS, SIZE 33 BY 4. SPECIFICATION No. 1068.

CORD CONSTRUCTION.

1. GENERAL. (a) Pneumatic automobile tire casings manufactured in accordance with this specification shall be of cord construction of the size known to the trade as 33 by 4.

(b) The tire shall give satisfactory service under a load of 815 pounds when inflated to 65 pounds per square inch.

(c) Tires to be free from all defects and fully guaranteed as to material and workmanship.

(d) Tires shall be of the standard commercial non-skid design of the manufacturer furnishing the same, or of rib tread design as specified on the order. In the case of a manufacturer using more than one non-skid tread design, selection of the design to be adopted is at the option of the Motor Transport Service. A small section of the tire shall be submitted for approval before contract is let.

(e) All tires shall be branded with the manufacturer's name, size of tire, serial number and marked with either tag or label in colors of red, white or blue, which will denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year. Years to be designated by square, triangle and round labels or tags. Tags or labels to be approximately 2 inches in diameter.

(f) As soon as possible, it is desired that all tires be marked with the equivalent millimeter sizes as recommended by the Society of Automotive Engineers.

2. TYPE. All tires manufactured in accordance with this specification shall be of the straight side type, designed for the standard S. A. E. straight side rim of the size 32 by 4 inches.

3. CONSTRUCTION. (a) Carcass of tire shall consist of no less than four and no more than eight separate plies of cord applied in such a manner that an equal number of plies shall run in each diagonal direction across the tire.

(b) All cord material to be of the best quality combed Sea Island or Egyptian cotton, or its physical equivalent.

(c) All cord fabrics must be thoroughly dried according to standard manufacturing practice before it is started through the operations of rubberizing.

(d) The usual methods of inspection used by tire companies in commercial practice to discover defects in each roll of cord fabric shall be employed, and tests to determine the tensile strength of cords shall be made on ten individual cords taken from each roll. These tests shall be made in the following manner:

The individual cords shall be tested in a fabric testing machine in which the distance between grips is approximately 10 inches, which grips separate at the rate of 20 inches per minute. The results shown must be up to the standard specification of the individual manufacturer.

(e) Beads shall be constructed in the same manner as in standard commercial practice. Tensile strength tests for wire strands as used by the individual tire manufacturers in the construction of beads shall be satisfactory in so far as they are capable of withstanding any chance of a bead stretching or blowing off the rim when under pressure.

(f) Two chafing strips of fabric weighing not less than 8 ounces per square yard shall be used. Each chafing strip must extend upward on each side of the tire at least 1 inch above the level of the bead. One chafing strip shall extend at least 3/16-inch above the other.

(g) There shall be a cushion of rubber compound applied over the cords which shall extend under the breaker. The minimum gage of this cushion shall be .050-inch.

(h) Over the cushion there shall be at least one breaker strip of open-weave fabric, mesh size as used in standard commercial practice, applied on both sides with a rubber compound having the physical and chemical properties of a nature to form a perfect union between the cushion and tread and the cure is effected. This breaker strip shall have a minimum width of 3 inches.

Breaker shall be made from the best quality of Sea Island or Egyptian cotton, or its physical equivalent, and shall weigh not less than 10 ounces per square yard.

(i) The tread of the tire shall not be less than 3/16-inch thick in the center, 1/16-inch thick in the middle, and 1/16-inch thick for the part of the tread under the middle of the non-skid portion.

(j) The sidewall of the tire shall have a minimum thickness of .0625-inch.

4. PHYSICAL MEASUREMENTS AND TESTS. (a) Cross sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. E. shall be 33.5 inches.

(b) The tire shall be capable of withstanding water pressure of 350 pounds per square inch without apparent injury. This test to be made at the discretion of the inspector.

(c) The minimum strength of the tire shall be 2,000 pounds. This "strength factor" is the product of the number of cords per inch measured at the tread at right angles to the cords; times strength of individual cord as specified.

All sections for approval must be sent to Lieutenant George B. Wells, Engineering Division, Motor Transport Corps, 358 Union Station, Washington, District of Columbia.

taken from the cord tire, times the number of plies.

(d) The strength of the union between breaker and tread and between breaker and cushion shall average 32 pounds or more per inch, using the standard friction test.

(e) Strength of the union between sidewall and plies shall average 14 pounds or more per inch, using the standard friction test.

(f) Strength of the union between sidewall and plies shall average 16 pounds or more per inch, using the standard friction test.

5. ROAD TEST. (a) Any manufacturer, bidding on orders for government tires, must be prepared to meet the following testing conditions:

(1) No tires are to be given approval by the Government unless the company submitting the bid tenders an affidavit stating that they have properly checked up tests on cars to properly test their pneumatic product, and that these cars deliver at least 15.000 miles weekly.

(2) The cars, speeds, loads and road conditions must be such that the tires are properly tested and the Government may appoint an inspector to see that the conditions are complied with.

(3) A successful bidder must submit an affidavit before delivering any tires to the Government, stating that the tires to be delivered are practically duplicates in construction and material of tires which he has previously tested properly, and sufficient number of tires satisfactory to the Motor Transport Service, at least six tires, have averaged on the rear wheels at least 5,000 miles.

(4) The inside of each tire shall be properly lined in accordance with the standard practice of tire manufacturers.

7. FLAPS. A flap of the size 33 by 4 shall be furnished with each tire as in standard commercial practice.

8. COMPOUND. The compound of the tread shall be made from and have the characteristics of a compound containing at least 70 per cent by volume of the best new rubber, content of sulphur shall not exceed 8 per cent by weight of the new rubber used. Compound shall contain no reclaimed rubber, minimum tensile strength of the compound shall be 1,800 pounds per square inch and shall have a minimum set of 25 per cent. Set test shall be made by stretching 2 to 10 inches and holding for 10 minutes. Rest sample for 10 minutes and then measure the per cent of elongation over the original length.

(b) Friction and Cushion—These shall be made from and have the characteristics of a compound containing at least 85 per cent by volume of the best quality new wild or plantation rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used. No reclaimed rubber can be used. Compound shall have a minimum tensile strength of 1,800 pounds per square inch and a minimum elongation of 450 per cent (2 to 11 inches) and a maximum set of 25 per cent. The compound shall be free of ingredients known to the rubber trade as "oil substitutes".

(c) Sidewall—The sidewall shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality new wild or plantation rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used. No reclaimed rubber can be used. Compound shall have a minimum tensile strength of 1,800 pounds per square inch and a minimum elongation of 450 per cent (2 to 11 inches) and a maximum set of 25 per cent. The compound shall be free of ingredients known to the rubber trade as "oil substitutes".

(d) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur-bearing mineral fillers, thereby causing the total sulphur to be over 8 per cent of the weight of new rubber, he may do so, but shall submit for analysis a sample of the finished unvulcanized stock. Such stock shall not show a sulphur content in the acetone extract of over 8 per cent of the weight of new rubber used.

9. INSPECTION. The Motor Transport Service reserves the right to make any inspection, test or analysis necessary to insure the product meeting all requirements of this specification.

10. PACKING. All tires shall be spirally wrapped according to standard practice and properly labelled on the outside showing size, type and name of the manufacturer, marked with either tag or label in colors of red, white or blue, which will denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year. Years to be designated by square, triangle and round labels or tags—tags or labels to be approximately 2 inches in diameter. Tires shipped for original equipment of cars shall be packed as specified by customer. In the case of overseas shipments, the specifications covering this shall be applied.

SPECIFICATIONS FOR PNEUMATIC AUTOMOBILE TIRE CASINGS, SIZE 35 BY 5. SPECIFICATION No. 1069.

CORD CONSTRUCTION.

1. GENERAL. (a) Pneumatic automobile tire casings manufactured in accordance with this specification shall be of cord construction, of the size known to the trade as 35 by 5 inches.

(b) The tire shall give satisfactory service under a load of 1,300 pounds when inflated to 75 pounds per square inch.

(c) Tires to be free from all defects and fully guaranteed as to material and workmanship.

(d) Tires shall be of the standard commercial non-skid design of the manufacturer furnishing the same, or of rib tread design as specified on the order. In the case of a manufacturer using more than one non-skid tread design, selection of the design to be adopted is at the option of the Motor Transport Service. A small section of the tire shall be submitted for approval before contract is let.

(e) The tires shall be plainly marked with manufacturer's name, serial number and marked with either tag or label in colors of red, white or blue which will denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year. Years to be designated by square, triangle and round labels or tags—tags or labels to be approximately 2 inches in diameter.

(f) As soon as possible, it is desired that all tires be marked with the equivalent millimeter sizes as recommended by the Society of Automotive Engineers.

2. TYPE. All tires manufactured in accordance with this specification shall be of the straight side type, designed for the standard S. A. E. straight side rim of the size 34 by 4 1/2 inches.

3. CONSTRUCTION. (a) Carcass of tire shall consist of no less than four and no more than eight separate plies of cord applied in such a manner that an equal number of plies shall run in each diagonal direction across the tire.

(b) All cord material to be of the best quality combed Sea Island, or Egyptian cotton, or its physical equivalent.

(c) All cord fabrics must be thoroughly dried according to standard manufacturing practice before it is started through the operations of rubberizing.

(d) The usual method of inspection used by tire companies in commercial practice to discover defects in each roll of cord fabric shall be employed, and tests to determine the tensile strength of cords shall be made in ten individual cords taken from each roll. These tests shall be made in the following manner:

The individual cords shall be tested in a fabric testing machine in which the distance between grips is approximately 10 inches, which grips separate at the rate of 20 inches per minute. The results shown must be up to the standard specification of the individual manufacturer.

(e) Beads shall be constructed with wire strands in the same manner as in standard commercial practice. Tensile strength tests for wire strands as used by the individual tire manufacturers in the construction of beads will be satisfactory in so far as they are sufficient to preclude any chance of a bead stretching or blowing off the rim under pressure.

(f) Two chafing strips of fabric weighing not less than 8 ounces per square yard shall be used. Each chafing strip must extend upward on each side of the tire at least $1\frac{1}{2}$ inches from the heel of the bead. One chafing strip shall extend at least 3 inches from the other.

(g) There shall be a cushion or rubber compound applied over the cords which shall be wider than the breaker. The minimum gage of this cushion shall be .0625 inch.

(h) Over the cushion there shall be at least one breaker strip of open-weave fabric such as is used in standard commercial practice, coated on both sides with a rubber compound having the physical and chemical properties of a nature to form a perfect union between the cushion and tread when the tire is effected. This breaker strip shall have a minimum width of 3½ inches. Breaker shall be made from the best quality Sea Island or Egyptian cotton, breaker shall be cut on a 45 degree bias, and shall weigh not less than 10 ounces per square yard.

(i) The tread of the tire shall not be less than 7/16-inch thick in center, 7/16-inch thick at the ends, and 7/32-inch thick for the part of the tread under the middle of the non-skid portion.

(j) The sidewall of the tire shall have a minimum thickness of .0625-inch.

PHYSICAL MEASUREMENTS AND TESTS. (a) Cross sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. E. shall be not less than 6.2 inches. (b) Tires shall be capable of withstanding a water pressure of 350 pounds per square inch without apparent injury. This test to be made at the discretion of the inspector.

(c) The minimum strength of the tire shall be 3,000 pounds. This "strength factor" is the product of the number of cords per inch measured at the tread at right angles to the cords; times strength of individual cord as taken from the cord tire; times the number of plies. (d) The strength of the union between breaker and tread and between breaker and cushion shall average 32 pounds or more, per inch, using the standard friction test.

(e) The strength of the union between sidewall and plies shall average 14 pounds or more, per inch, using the standard friction test.

(f) Strength of the union between cushion and plies shall average 16 pounds or more, per inch, using the standard friction test.

5. ROAD TEST. (a) Any manufacturer bidding on orders for government business must be prepared to meet the following conditions: (1) No tires or tire products to be given consideration by the Government unless the company submitting the bid tenders an affidavit stating that they maintain proper and fully equipped test plants on cars to properly test pneumatic tires and that they deliver an average of 8,000 tire miles weekly. (c) The cars, speeds, loads, and road conditions must be such that the tires are properly tested and the Government may appoint an inspector to see that the above conditions are complied with.

(d) A successful bidder must supply an affidavit before delivering any tires to the Government stating that the tires to be delivered are practically duplicated in construction and material of tires which he has previously tested properly and a sufficient number of tires satisfactory to the Motor Transport Service, at least six tires, having averaged on the rear wheels at least 5,000 miles.

6. LINING. The inside of each tire shall be properly lined in accordance with the standard practice of tire manufacturers.

7. FLAPS. A flap of the size 3½ by 6 shall be furnished with each tire, as in standard commercial practice.

8. COMPOUND. (a) The tread shall be made from and have the characteristics of a compound containing at least 70 per cent by volume of the best new rubber. Content of sulphur shall not exceed 8 per cent by weight of the new rubber used. Compound shall contain no reclaimed rubber. The minimum tensile strength of the tread shall be 1,800 pounds per square inch and a minimum elongation of 450 per cent by stretching 2 to 10 inches and holding for 10 minutes, re-stretching to original length, and then measuring the per cent of elongation over the original length.

(b) Friction and Cushion—These shall be made from and have the characteristics of a compound containing at least 80 per cent by volume of the best quality new vulcanized or plantation rubber. Sulphur content shall not contain more than 8 per cent by weight of new rubber used. No reclaimed rubber shall be used. Compound shall have a minimum tensile strength of 1,800 pounds per square inch and a minimum elongation of 450 per cent by stretching 2 to 11 inches and of a minimum set of 25 per cent. The compound shall be free of ingredients known to the rubber trade as "oil substitutes."

(c) The total sulfur in the tread and a minimum elongation of 450 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur-bearing mineral fillers, thereby causing the total sulphur to be more than 8 per cent by weight, he may, at his option, but shall submit for analysis a sample of the finished unvulcanized stock. Such stock shall not show a sulphur content in the acetone extract of over 8 per cent by weight.

INSPECTION. The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of these specifications.

9. PACKING. All tires shall be spirally wrapped according to standard practice and properly labelled on the outside showing size, type, name of manufacturer, and color. The weight of the tire shall be marked in red, white or blue which will denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year; yellow, year of calendar year. Square, triangle and round labels or tags—tags or labels to be approximately 2 inches in diameter. Tires shipped for original equipment of cars shall be packed as

specified by customer. In the case of overseas shipments, the specification covering this shall be applied.

SPECIFICATIONS FOR PNEUMATIC AUTOMOBILE TIRE CASINGS, SIZE 36 BY 6.

SPECIFICATION NO. 1070. CORD CONSTRUCTION.

1. GENERAL. (a) Pneumatic automobile tire casings manufactured in accordance with this specification shall be of cord construction of the size specified in the trade name.

(b) The tire casing shall give satisfactory service under a load of 2,000 pounds, when inflated to 90 pounds per square inch.

(c) Tires to be free from all defects and fully guaranteed as to material and workmanship.

(d) Tires shall be of the standard commercial non-skid design of the manufacturer furnishing the same, or of rib tread design as specified on the order. In the case of a manufacturer using more than one non-skid design, selection of the design to be adopted is left to the option of the Motor Transport Corps. A small section of the tire shall be submitted for approval before contact is let.

(e) All tires shall be plainly marked with manufacturer's name and the size of the tire and marked with either tag or label in colors of red, white or blue, which shall denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year. Years to be designated by square, triangle and round label or tags—tags or labels to be approximately two inches in diameter.

(f) As soon as possible it is desired that all tires be marked with the equivalent millimeter sizes as recommended by the Society of Automotive Engineers.

(g) Tires. All tires manufactured in accordance with this specification shall be of the straight side rim of the size 36 by 6 inches.

3. CONSTRUCTION. (a) Carcass of tire shall consist of no less than four and no more than twelve separate plies of cord applied in such a manner that a sufficient number of plies shall run in each diagonal direction across the tire.

(b) All cord material to be of the best quality, combed Sea Island or Egyptian cotton, breaker and cushion of the same.

(c) All cord fabric must be thoroughly dried according to standard manufacturing practice, before it is started through the operations of rubbering.

(d) The usual methods of inspection used by tire companies in commercial practice to discover defects in each roll of cord fabric, shall be employed, and tests to determine the tensile strength of cords shall be made in ten individual cords taken from each roll. These tests shall be made in the following manner:

The individual cords shall be tested in a fabric testing machine in which the distance between grips is approximately 10 inches, which grips separate at the rate of 20 inches per minute. The results shown must be up to the standard specifications of the individual manufacturer.

(e) Beads shall be constructed with wire strands in the same manner as in standard commercial practice. Tensile strength tests for wire strands as used by the individual tire manufacturers in the construction of beads will be satisfactory in so far as they are sufficient to preclude any chance of a bead stretching or blowing off the rim when under pressure.

(f) Two chafing strips of fabric weighing not less than 8 ounces per square yard shall be used. Each chafing strip must extend upward on each side of the tire at least $1\frac{1}{2}$ inches from the heel of the bead. One chafing strip shall extend at least 3 inches above the other.

(g) There shall be a cushion or rubber compound applied over the cords which shall be wider than the breaker. The minimum gage of this cushion shall be .080-inch.

(h) Over the cushion there shall be at least one breaker strip of open-weave fabric such as is used in standard commercial practice, coated on both sides with a rubber compound having the physical and chemical properties of a nature to form a perfect union between the cushion and tread when the cure is effected. This breaker strip shall have a minimum width of 4½ inches and shall be cut on a 45 degree bias. Breaker shall be made from the best quality, Sea Island or Egyptian cotton or of the same material as the cushion.

(i) The tread of the tire shall not be less than 9/16-inch thick, 7/32-inch of which shall be the minimum thickness for the part of the tread under the middle of the non-skid portion.

(j) The sidewall of the tire shall have a minimum thickness of .0625-inch.

PHYSICAL MEASUREMENTS AND TESTS. (a) Cross sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. E. shall be not less than 6.2 inches.

(b) Tires shall be capable of withstanding water pressure of 350 pounds per square inch without apparent injury. This test to be made at the discretion of the inspector.

(c) The minimum strength of the tire shall be 3,000 pounds. This "strength factor" is the product of the number of cords per inch measured at the tread at right angles to the cords; times strength of individual cord as taken from the cord tire; times the number of plies.

(d) The strength of the union between breaker and tread and between breaker and cushion shall average 32 pounds or more per inch, using the standard friction test.

(e) The strength of the union between sidewall and plies shall average 14 pounds or more per inch, using standard friction test.

(f) Strength of the union between cushion and plies shall average 16 pounds or more per inch, using the standard friction test.

5. ROAD TEST. (a) Any manufacturer bidding on orders for the government business must be prepared to meet the following testing conditions: (1) No tires are to be given consideration by the Government unless the company submitting the bid tenders an affidavit stating that they maintain proper and fully equipped test plants on cars to properly test their pneumatic tire product and that these cars deliver an average of 8,000 tire miles weekly.

(c) The cars, speeds, loads, and road conditions must be such that the tires are properly tested and the Government may appoint an inspector to see that the above conditions are complied with.

(d) A successful bidder must supply an affidavit before delivering any tires to the Government stating that the tires to be delivered are practically duplicated in construction and material of tires which he has previously tested properly and a sufficient number of tires satisfactory to the Motor Transport Service, at least six tires, having averaged on the rear wheels at least 5,000 miles.

6. LINING. The inside of each tire shall be properly lined in accordance with the standard practice of tire manufacturers.

7. FLAPS. A flap of the size 3½ by 6 shall be furnished with each tire as in standard commercial practice.

All sections for approval must be sent to Lieutenant General B. Wells, Engineering Division, Motor Transport Corps, 358 Union Station, Washington, District of Columbia.

8. **COMPOUNDS.** (a) The tread shall be made from and have the characteristics of a compound containing at least 70 per cent by volume of the best new rubber. Content of sulphur shall not exceed 8 per cent by weight of the new rubber used. (b) Compound shall be of the best quality combed S. A. E. standard. Minimum tensile strength of tread rubber shall be 2,600 pounds per square inch and shall have a minimum set of 25 per cent. Set test shall be made by stretching 2 to 10 inches and holding for 10 minutes and then measure the per cent of elongation over the original length.

(c) **Friction and Cushion.**—These shall be made from and have the characteristics of a compound containing at least 85 per cent by volume of the best quality new wild or plantation rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used. No reclaimed rubber shall be used.

(d) **Sidewall.**—The sidewall shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality new wild or plantation rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used. No reclaimed rubber shall be used. Compound shall have a minimum tensile strength of 1,800 pounds per square inch and a minimum elongation of 450 per cent (2 to 11 inches) and a maximum set of 25 per cent. The compound shall be free of ingredients known to rubber trade as "oil substitutes."

(e) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing fillers, thereby causing the total sulphur to be more than 8 per cent of the weight of new rubber, he may do so but shall submit for analysis a sample of the finished unvulcanized stock. Such stock shall not show a sulphur content in the acetone extract of over 8 per cent of the weight of new rubber used.

9. **INSPECTION.** The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all the requirements of this specification.

10. **PACKING.** All tires shall be spirally wrapped according to standard practice and properly labelled on the outside showing size, type and name of manufacturer, marked with either tag or label in colors of red, white or blue which will denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year; years to be designated by square, triangle and round labels or tags—tags or labels to be approximately 2 inches in diameter. Tires shipped for original equipment of cars shall be packed as specified by customer. In the case of overseas shipment, the specifications covering this shall be applied.

SPECIFICATIONS FOR PNEUMATIC AUTOMOBILE TIRE CASINGS, SIZE 38 BY 7. SPECIFICATION NO. 1071.

CORD CONSTRUCTION.

1. **GENERAL.** (a) Pneumatic automobile tire casings manufactured in accordance with this specification shall be of cord construction of the size known to the trade as 38 by 7.

(b) The tire must give satisfactory service under a load of 2,700 pounds, when inflated to 100 pounds per square inch.

(c) Tires shall be free from all defects and fully guaranteed as to material and workmanship.

(d) Tires shall be of the standard commercial non-skid design of the manufacturer furnishing the same, or of rib tread design as specified on order. In the case of a manufacturer using more than one non-skid tread design, selection of the design to be adopted is at the option of the Motor Transport Service. A small section of the tire shall be submitted for approval before contract is let.

(e) The tires shall be plainly marked with manufacturer's name, serial number and size of tire and marked with either tag or label in colors of red, white or blue, which will denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year; years to be designated by square, triangle and round labels or tags—tags or labels to be approximately 2 inches in diameter.

(f) As soon as possible it is desired that all tires be marked with the equivalent millimeter sizes as recommended by the Society of Automotive Engineers.

2. **TYPE.** All tires manufactured in accordance with this specification shall be of the straight side type, designed for the standard S. A. E. straight side rim of the size known to the trade as 38 by 7 inches.

3. **CONSTRUCTION.** (a) Casings of tire shall consist of no less than four and no more than fourteen separate plies of cord applied in such a manner that an equal number of plies shall run in each diagonal direction across the tire.

(b) All cord material to be of the best quality combed S. A. E. standard. Compound shall be of the best quality combed S. A. E. standard.

(c) All cord fabric must be thoroughly dried according to standard manufacturing practice, before it is started through the operations of rubber rolling.

(d) The usual methods of inspection used by tire companies in commercial practice to discover defects in each roll of cord fabric, shall be employed, and it is the duty of the manufacturer to determine the tensile strength of cords shall be made in the individual cords taken from each roll. These tests shall be made in the following manner:

The individual cords shall be tested in a fabric testing machine in which the distance between grips is approximately 10 inches, which grips separate at the rate of 30 inches per minute. The results shown must be up to the standard specification of the individual manufacturer.

Beads shall be constructed of wire strands in the same manner as used by the individual tire manufacturers in the construction of beads which are to be satisfactory so far as possible, and without the chance of a bead stretching or blowing off the rim when under pressure.

(e) Two chaining strips of fabric weighing not less than 12 ounces per square yard, shall be used. One chaining strip must extend upward on each side of the tire at least 13 inches from the level of the bead. One chaining strip shall extend at least 13 inches above the other.

(f) There shall be a cushion of rubber compound applied over the cords which shall be at least 36 inches in diameter. The bottom edge of this cushion shall be .680-inch.

(g) Over the cushion there shall be at least one breaker strip of open weave fabric, woven to standard commercial specifications, and applied on both sides with a rubber compound having the physical and chemical properties of a nature to form a perfect union between the cushion and

tread when the cure is effected. This breaker strip shall have a minimum width of 5½ inches.

Breaker shall be made from the best quality Java Island or Egyptian cotton, of the identical equivalent and shall weigh not less than 10 ounces per square yard.

(h) The tread of the tire shall not be less than ½-inch thick, ½-inch of which shall be minimum thickness for the part of the tread under the middle of the non-skid portion.

(i) The sidewall of the tire shall have a minimum thickness of .0625-inch.

4. **PHYSICAL MEASUREMENTS AND TESTS.** (a) Cross sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. E. shall not be less than 7.25 inches.

(b) Tire shall be capable of withstanding water pressure of 350 pounds per square inch without apparent injury. This test to be made at the discretion of the inspector.

(c) The minimum strength of the tire shall be 3,500 pounds. This "strength factor" is the product of the number of cords per inch measured at the tread at right angles to the cords; times strength of individual cords as taken from the cord time; times the number of plies.

(d) The strength of the union between breaker and tread and between breaker and cushion shall average 32 pounds or more per inch, using the standard friction test.

(e) Strength of the union between sidewall and plies shall average 14 pounds or more per inch, using the standard friction test.

(f) Strength of the union between cushion and plies shall average 16 pounds or more per inch, using the standard friction test.

5. **ROAD TESTS.** Any manufacturer bidding on orders for government business must be prepared to meet the following testing conditions:

(a) The tires to be given consideration by the Government, unless the company submitting the bid tenders an affidavit stating that they maintain and properly check up tests on cars to properly test their pneumatic product and that these cars deliver an average of 8,000 tire miles weekly.

(b) The cars, speed, loads, and road conditions must be such that the tire and the road test shall be made in such a manner as to insure that the above conditions are complied with.

(c) A successful bidder must supply an affidavit before delivering any tires to the Government, stating that the tires to be delivered are practically duplicates in construction and material of the tires which he previously tested properly and a sufficient number of tires satisfactory to the Motor Transport Service, at least six tires, have averages on the rear wheels of at least 5,000 miles.

6. **LINING.** The inside of each tire shall be properly lined in accordance with the standard practice of tire manufacturers.

7. **FLAPS.** A flap of the size 38 by 7 shall be furnished with each tire as in standard commercial practice.

8. **COMPOUNDS.** (a) Tread—The tread shall be made from and have the characteristics of a compound containing at least 70 per cent by volume of the best new rubber. Content of sulphur shall not exceed 8 per cent by weight of the new rubber used. Compound shall contain no reclaimed rubber. Minimum tensile strength of tread rubber shall be 2,600 pounds per square inch and shall have a minimum set of 25 per cent. Set test shall be made by stretching 2 to 10 inches and holding for 10 minutes and then measure the per cent of elongation over the original length.

(b) **Friction and Cushion.**—These shall be made from and have the characteristics of a compound containing at least 85 per cent by volume of the best quality new wild or plantation rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used. No reclaimed rubber can be used. Compound shall have a minimum tensile strength of 1,800 pounds per square inch and a minimum elongation of 450 per cent (2 to 11 inches) and a maximum set of 25 per cent. The compound shall be free of ingredients known to the rubber trade as "oil substitutes."

(c) **Sidewall.**—The sidewall shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality new wild or plantation rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used. No reclaimed rubber can be used. Compound shall have a minimum tensile strength of 1,800 pounds per square inch and a minimum elongation of 450 per cent (2 to 11 inches) and a maximum set of 25 per cent. The compound shall be free of ingredients known to the rubber trade as "oil substitutes."

(d) The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be over 8 per cent of the weight of new rubber, he may do so, but shall submit for analysis a sample of the finished unvulcanized stock. Such stock shall not show a sulphur content in the acetone extract of over 8 per cent of the weight of new rubber used.

9. **INSPECTION.** The Motor Transport Service reserves the right to make any inspection or test or analysis necessary to insure the product meeting all requirements of this specification.

10. **PACKING.** All tires shall be spirally wrapped according to standard practice and properly labelled on the outside showing size, type and name of manufacturer, and marked with either tag or label in colors of red, white or blue which will denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year; years to be designated by square, triangle and round labels or tags—tags or labels to be approximately 2 inches in diameter. Tires shipped for original equipment of cars shall be packed as specified by customer. In the case of overseas shipments, the specifications covering this shall be applied.

SPECIFICATIONS FOR PNEUMATIC AUTOMOBILE TIRE CASINGS, SIZE 40 BY 8. SPECIFICATION NO. 1072.

CORD CONSTRUCTION.

1. **GENERAL.** (a) Pneumatic automobile tire casings manufactured in accordance with this specification shall be of cord construction of the size known to the trade as 40 by 8.

(b) The tire must give satisfactory service under a load of 3,650 pounds, when inflated to 100 pounds per square inch.

(c) Tires to be free from all defects and fully guaranteed as to material and workmanship.

(d) Tires shall be of the standard commercial non-skid design of the manufacturer furnishing the same, or of rib tread design as specified on order. In the case of a manufacturer using more than one non-skid tread design, selection of the design to be adopted is at the option of the Motor Transport Service. A small section of the tire shall be submitted for approval before contract is let.

(e) The tires shall be plainly marked with manufacturer's name, size of tire, serial number, and the tires shall be marked with either tag or label in colors of red, white or blue, which will denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year; years to be designated by square, triangle and round labels or tags—tags or labels to be approximately 2 inches in diameter.

(f) As soon as possible it is desired that all tires be marked with the

available in different sizes as recommended by the Society of Automotive Engineers.

(b) **TYPE.** All tires manufactured in accordance with this specification shall be of the straight side type, designed for the standard S. A. E. straight side size and type.

(c) **CONSTRUCTION.** (a) Carcass of tire shall consist of not less than two, and not more than sixteen separate plies of cord applied in such a manner that an equal number of plies shall run in each diagonal section across the tire.

(b) All cord material to be of the best quality combed Sea Island or Egyptian cotton or of the physical equivalent.

(c) All cord fabric must be thoroughly dried according to standard manufacturing practice, before it is started through the operations of vulcanization.

(d) The usual methods of inspection used by tire companies in commercial practice to discover defects in each roll of cord fabric shall be employed, and tests to determine tensile strength of cords shall be made on the individual cords taken from each roll. These tests shall be made in the following manner:

(1) The individual cord shall be tested in a fabric testing machine in which the distance between grips is approximately 10 inches, which grips separate at the rate of .20 inches per minute. The results shown must be up to the standard specification of the individual manufacturers.

(2) Beads shall be constructed with wire strands in the same manner as in standard commercial practice. Tensile strength tests for wire strands as used by the individual tire manufacturers in the construction of beads will be satisfactory in so far as they are intended to preclude any chance of a bead stretching or blowing off the rim when under pressure.

(3) Two chafing strips of fabric weighing not less than 12 ounces per square yard, shall be used. Each chafing strip must extend around each side of the tire, at least 2 inches from the heel of the bead. One chafing strip shall extend at least 1/4 inch above the other.

(4) There shall be a cushion of rubber applied over the cords which shall be wider than the breaker. The minimum gauge of this cushion shall be .006 inch.

(5) Over the cushion there shall be at least one breaker strip of open-weave fabric, such as is used in standard commercial practice, coated on both sides with a rubber compound having the physical and chemical properties of a tire to be formed by the same method of curing and tread when the cure is effected. This breaker strip shall have a minimum width of 6 1/2 inches and shall be cut on a 45-degree bias. Breaker shall be cut from the best quality combed Sea Island or Egyptian cotton or its physical equivalent, and shall not weigh less than 10 ounces per square yard.

(6) The tread of the tire shall be not less than 11/16-inch thick, 1/4-inch of which shall be the minimum thickness for the part of the tread under the middle of the non-skid portion.

(7) The sidewall of the tire shall have a minimum thickness of .065-inch. Minimum physical maximum thickness of each section of the sidewall.

(8) Each tire inflated according to the recommended weight and load schedule of the S. A. E. shall not be less than 8.25-inch.

(9) The tire shall be capable of withstanding a water pressure of 350 pounds per square inch without apparent injury. This test to be made at the discretion of the inspector.

(10) The minimum length of the tire shall be 4,000 pounds. This "strength factor" is the product of the number of cords per inch measured at the tread at right angles to the cords; times strength of individual cord as taken from the cord tire; times the number of cords between breaker and tread and the strength of the union between breaker and tread and between breaker and cushion shall average 32 pounds or more per inch, using the standard friction test.

(11) Strength of the union between sidewall and plies shall average 14 pounds or more per inch, using the standard friction test.

(12) Strength of union between cushion and plies shall average 16 pounds or more per inch, using the standard friction test.

(13) **ROAD TEST.** Any manufacturer bidding on orders for government business must be prepared to meet the following testing conditions:

(a) No tire to be given consideration by the Government unless the company submitting the bid tenders an affidavit stating that they maintain and properly check up tests on cars to properly test their pneumatic tire product and that these cars deliver an average of 8,000 tire miles weekly.

(b) The cars, speeds, loads and road conditions must be such that the tires are properly tested and the Government may appoint an inspector to see that the above conditions are complied with.

(c) A successful bidder must supply an affidavit before delivering any tires to the Government stating that the tires to be delivered are of the best quality new rubber, and that the company submitting the bid has previously tested properly and a sufficient number of tires, satisfactory to the Motor Transport Service, at least six tires, have averaged on the rear wheels at least 4,000 miles weekly.

(d) **LINING.** The inside of each tire shall be properly lined in accordance with the standard practice of tire manufacturers.

(e) **PLAYS.** A ply of cushioning by 8 shall be furnished with each tire, as in standard commercial practice.

(f) **COMPOUNDS.** (a) The tread shall be made from and have the characteristics of a compound containing a minimum of 70 per cent by volume of the best new rubber. Content of sulphur shall not exceed 8 per cent by weight of the new rubber used. Compound shall contain no reclaimed rubber. Minimum tensile strength of tread rubber shall be 25 per cent. Test shall be made by stretching 2 inches to 10 inches, and holding for 10 minutes. Rest sample for 10 minutes and then measure the per cent of elongation of the original length.

(b) **Friction and Cushion.**—These shall be made from and have the characteristics of a compound containing at least 8 per cent by volume of the best quality new rubber, and the maximum of 25 per cent by weight of reclaimed rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used. No reclaimed rubber shall be used.

(c) **Sidewall.** The sidewall shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality new wild or plantation rubber. Sulphur content shall not be more than 8 per cent by weight of new rubber used. Compound shall be 1,800 pounds per square inch and a minimum elongation of 450 per cent (2 to 11 inches), and a maximum of 25 per cent by weight of reclaimed rubber. The total sulphur in any of the above compounds shall not exceed 8 per cent of the weight of new rubber used, except following, if the manufacturer desires to use sulphur-bearing mineral fillers, thereby causing the total sulphur to be over 8 per cent of the weight of new rubber, he may do so, but shall submit for analysis a sample of the finished compound. Such stock shall show no sulphur content in the acetone extract of over 8 per cent of the weight of new rubber used.

(g) **INSPECTION.** The Motor Transport Service reserves the right to make any inspection test, or analysis necessary to insure the product meeting all requirements of this specification.

(h) **PACKING.** All tires shall be spirally wrapped according to standard practice and properly labeled on the outside showing size, type, and name of manufacturer, and marked with either tag or label in colors of red, white or blue, which will denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year—years to be designated by square, triangle and round labels or tags—tags or labels to be approximately 2 inches in diameter. The tires shipped for original use in cars shall be packed as specified by customer. In the case of overseas shipments, the specifications covering this shall be applied.

SPECIFICATIONS FOR PNEUMATIC TIRE INNER TUBES.

SPECIFICATION No. 1002.

1. **GENERAL.** This specification covers the following sizes:

(a) 26 by 5, 28 by 3, 29 by 3 1/2, 30 by 3 1/2, 33 by 4, 35 by 5, 36 by 6, 38 by 7, 40 by 8.

(b) All tubes manufactured to this specification shall be of the endless type except motorcycle tubes which shall be butt end or endless.

(c) All tubes shall be free from defects and guaranteed as to material and workmanship.

2. **COLOR.** The color of the tubes shall be left to the discretion of the manufacturer to use that which has been generally used by the individual manufacturer with the best results in standard commercial practice.

3. **COMPOUND.** (a) Tubes shall be made from and have the characteristics of a compound containing a minimum of 90 per cent by volume of the best quality new wild or plantation rubber. Sulphur content shall not exceed 7 per cent by weight of new rubber used.

(b) The total organic acetone extract of the cured compound shall not exceed 10 per cent by weight of the new rubber used.

(c) The total sulphur shall not exceed 7 per cent of the weight of rubber used, except as follows: if the manufacturer desires to use sulphur bearing mineral fillers, thereby causing the total sulphur to be over 7 per cent of the weight of rubber, he may do so, but shall submit for analysis a sample of the finished unvulcanized stock. Such stock shall not show a sulphur content in the acetone extract of over 7 per cent of the weight of new rubber used.

(d) The filling material shall consist exclusively of dry mineral matter of which not more than 6 per cent of the total weight of the compound shall be of any one kind, and in no case shall the calcium sulphate exceed 75 per cent of the weight of the antimony present, the total antimony being calculated to antimony pentasulphide.

4. **TESTS AND INSPECTION.** All tubes shall conform to the following table for minimum curing pole size and minimum gauges:

Size.	Minimum Pole Size.	Minimum Thickness.
26 by 3	1 1/4 inches	.072
28 by 3	1 1/2 inches	.072
29 by 3 1/2	2 inches	.080
30 by 3 1/2	2 1/4 inches	.085
33 by 4	2 1/2 inches	.095
35 by 5	3 inches	.125
36 by 6	3 1/2 inches	.125
38 by 7	4 inches	.155
40 by 8	4 1/4 inches	.155

(b) In case tube is mould-cured measurements must be equivalent to above as determined by volume. If different-sized poles are used volume of rubber shall be determined by the above measurements.

5. **SPRICE.** The splice shall be as strong as the rest of the tube under inflation test.

6. **VALVES.** Each tube shall be fitted with one complete Schrader valve, or its equivalent, applied in such a manner as not to leak or tear out under ordinary usage. The following schedule shall apply:

26 by 3	Valves similar to Schrader's.....	No. 1936
28 by 3	Valves similar to Schrader's.....	No. 1936
29 by 3 1/2	Valves similar to Schrader's.....	No. 1936
30 by 3 1/2	Valves similar to Schrader's.....	No. 725 or No. 967
33 by 4	Valves similar to Schrader's.....	No. 923 or No. 967
35 by 5	Valves similar to Schrader's.....	No. 792
36 by 6	Valves similar to Schrader's.....	No. 2033
38 by 7	Valves similar to Schrader's.....	No. 2033
40 by 8	Valves similar to Schrader's.....	No. 2033

Each valve shall be fitted out with lock nut, rim nut, valve cap and valve. Dust cap shall be furnished for all valves with the exception of 26 by 3, 28 by 3 1/2, 29 by 3 1/2, 30 by 3 1/2, 33 by 4 and 35 by 5.

7. **MARKING.** These tubes shall be plainly marked with the manufacturer's name and size of tube, in both the inch and the millimeter equivalent and in accordance with S. A. E. standards.

8. **TESTS AND INSPECTION.** (a) Chemical and physical tests shall be made from each lot of and throughout the entire lot in order to insure compliance with this specification. For physical tests cut from tube specimen in the form of the standard shape for rubber test samples.

(b) The center of the sample shall be 1/2 inch in width. The thickness shall be the full thickness of the tube and the length shall be 1 inch. The average of tests of five specimens cut longitudinally from each lot shall show a minimum elongation of 750 per cent (1 inch to 8 1/2 inches), and a permanent set of not more than 10 per cent. The per cent of permanent set will be determined by stretching test piece 500 per cent (1 inch to 6 inches) and holding at 500 per cent of elongation followed by 10 minutes' rest and then measuring the per cent of elongation of test piece over the original 1-inch length. This percentage shall be called the per cent of permanent set of the square inch. Minimum tensile strength of tubes shall be 1,600 pounds per square inch.

(c) Each tube shall be tested for leaks by inflating with air and immersing in water.

9. **PACKING.** The Motor Transport Service reserves the right to make any inspection test, or analysis necessary to insure the product meeting all requirements of this specification.

(a) Each tube shall be wrapped and packed in an adequate pasteboard carton, such as is usually used by the manufacturer producing the tubes. The boxes shall be plainly marked with the manufacturer's name, the tube size, the tube type, and marked with the label in colors of red, white or blue, which will denote as follows: red, first four months of calendar year; white, second four months of calendar year; blue, last four months of calendar year—years to be designated by square, triangle and round labels or tags. Tags or labels to be approximately 2 inches in diameter.

RUBBER ASSOCIATION PLAYS GOLF FOR THE SOLDIERS.

THE Second Annual Golf Tournament of the Rubber Association of America, held September 25, at the Trenton County Club, Trenton, New Jersey, was an unequalled success. The surplus receipts over and above the actual expenses of the tournament will be distributed equally between the American Red Cross, Knights of Columbus and Y. M. C. A. war relief funds.

J. A. Lambert, John S. Broughton, A. Boyd Cornell and L. P. Destribats met the visitors at the station and automobiles were waiting to carry them to the country club where they were cordially received by other members of the Trenton Rubber Manufacturers' Association.

The Tournament (eighteen holes medal play) in competition for the trophy cup—won by Trenton last year—was managed by Horace T. Cook, J. Cornell Murray and Harold F. Blanchard. Fifty dollars in War Savings Stamps was donated by the Rubber Association of America as prizes for the best gross and net scores. The following were the competing teams:

W. J. Kelly presided at the dinner and announced the following winners: New York won the trophy with 334 for the four

best net scores; the West was second with 335; New England, third with 344, and Trenton, fourth with 347. Eighty-five, the first best gross score, was won by J. W. Herron who received \$15 in War Savings Stamps. The second best gross was T. A. Ashley's score of 88 and he received \$10 in stamps. First best net was won by E. M. Prunn with 79 and the prize was \$15 in stamps. John W. Thomas won the second best net with a score of 82, receiving \$10 worth of stamps.

The only speaker of the evening, ex-Governor Stokes of New Jersey, then addressed the audience which was amused and thrilled by the wit and patriotic logic of this popular after-dinner orator. In conclusion a vote of thanks was extended to the Trenton Rubber Manufacturers' Association as well as to the Outing Committee of the Rubber Association of America, comprising W. J. Kelly, chairman *pro tem.*, L. P. MacMichael, A. A. Garthwaite, and H. S. Vorhis, secretary, for their united efforts that made possible this most enjoyable outing of patriotic rubber men on a day's vacation.

Among the Akron manufacturers present were Harvey S. Firststone and C. W. McLaughlin. A. D. Thornton of Montreal represented the Canadian manufacturers.

PERUVIAN LONG-STAPLE COTTON.

According to recent reports, there is at present a demand for American cotton gins and cotton baling machinery in Iquitos, the distributing point for goods for the whole of eastern Peru.

It appears that unusual interest has been aroused in the production of cotton and that the acreage is being extended. An excellent grade of cotton is raised from Sea Island seed imported from the United States. All of this cotton has an extraordinarily long staple, while the fiber is very silky, and compares favorably with the best Sea Island and Egyptian cotton. So far, all the cotton raised has been shipped to Liverpool, but producers are considering exportation to the United States as well.

CUSTOMS APPRAISER'S DECISIONS.

GUTTA SIAK.—Gutta Siak, classified under paragraph 502, Tariff Act of 1913, is crude gutta percha and should be admitted free of duty, on the protest of L. Littlejohn & Co., New York City. (Treasury Decisions, Vol. 35, No. 11, September 12, 1918.)

A REPRESENTATIVE GROUP OF MEMBERS AND GUESTS.

Annual Meeting of the Rubber Section of the American Chemical Society.

THE annual meeting of the rubber section of the American Chemical Society was held in Cleveland, September 11-12, at the Hotel Statler. Dr. L. E. Weber, chairman of the section, was prevented by illness from being present, and in his absence George Oenslager, of The B. F. Goodrich Co., a member of the executive committee of the rubber section, was selected to preside. The program as announced in the September number of THE INDIA RUBBER WORLD, was then taken up.

THE DETERMINATION OF LAMPBLACK.

A. H. Smith, of the Bureau of Standards, presented a very interesting description of the work they are doing on the determination of free carbon in rubber goods. The principal use of this method is to check the quality of the tires offered to the Government for war purposes, but the method has much wider applications. The essential point of this method is the complete removal by means of appropriate solvents and concentrated nitric acid, of all substances which would change weight on ignition, excepting the lampblack itself. The residue is then heated, and the loss in weight represents the carbon. A small correction is necessary to provide for the errors of the determination. This paper was discussed by Messrs. Evans, Tuttle, and Oenslager. Mr. Evans stated that this method had been used for a short time at the laboratories of The B. F. Goodrich Co. and found sufficiently accurate for commercial work.

LABORATORY METHODS FOR DETERMINING THE DEGREE OF VULCANIZATION.

Mr. Cranor gave a very excellent discussion, showing the difference in vulcanization between two compounds, one containing litharge as accelerator, and the other an organic accelerator. In the latter case he pointed out that complete vulcanization was reached before the ratio of combined sulphur to rubber showed a vulcanization equal to that of litharge. From this he concluded that physical tests alone were unsatisfactory in determining the correct vulcanization, and were absolutely worthless in determining small changes in vulcanization. He advocated chemical methods for vulcanization control, using for this purpose the combined sulphur ratio. He claimed this was much more sensitive than physical methods, and, the standard once set, it was comparatively simple and accurate to follow up.

THE FRUIT-JAR RING SITUATION.

The discussion on fruit-jar rings was opened by Charles P. Fox, who presented a very vivid picture of the conditions as he found them in the course of his investigations. He advocated the use of several simple tests, such as folding test, pulling test, and the twisting test. By means of these, purchasers of small quantities can instantly tell whether or not they have a good jar ring.

Mr. Fox's discussion was followed by remarks from Messrs. Tuttle, McGregor, Brock, Brittain, Warner and Dannenb. Mr. Tuttle stated that it is well known that a tremendous loss occurred during the year 1917, owing to the preserving of fruit in jars sealed by poor jar rings. The Government is working on this subject, but it is a question as to the progress made. He urged that the rubber section take up this subject with the idea of starting a campaign of education and driving the poor jar rings off the market. Mr. McGregor said that he understood the Canadian Government is working along the same lines. Mr. Brittain called attention to the fact that in many cases jar lids do not fit well, and therefore do not permit the jar ring to function properly.

Mr. Warner called attention to the way in which fruit-jar rings are marketed, stating that it is exceptional for them to be sold under the brand, or trade-mark, of manufacturers. They are sold through jobbers, and the same ring appears on the market under a number of different brands. This makes it difficult to trace bad rings back to the maker.

As a result of the foregoing discussion, it was decided to form a committee to be appointed by the chairman, whose duty it shall be to see that the attention of the public is drawn to this matter by a campaign of education, and also to work with the manufacturers and jobbers to ascertain what can be done towards establishing and maintaining a standard of quality. The chairman appointed as this committee the following: L. J. Plumb, United States Rubber Reclaiming Co., Inc., New York City; Charles P. Fox, consulting chemist, Cleveland, Ohio; A. H. Smith, assistant chemist, Bureau of Standards, Washington, District of Columbia; George Oenslager, chief chemist, The B. F. Goodrich Co., Akron, Ohio; and a representative of the Boston Woven Hose and Rubber Co., Boston, Massachusetts, to be announced later.

VULCANIZATION OF RUBBER AT CONSTANT AND BY A SERIES OF INCREASING TEMPERATURES.

The paper by G. D. Kratz and Arthur H. Flower was complete substantiation of the conclusions reached by Mr. Cranor. Mr. Kratz covered the subject very thoroughly, and in such detail as to leave no room for argument. The paper will be published at an early date, and no doubt will be carefully studied by all who are interested in this subject.

THE POISONOUS NATURE OF SOME ACCELERATORS AND PRECAUTIONS REGARDING THEIR USE.

The report of the committee on organic accelerators was read by the secretary, in the absence of Dr. Earle, chairman of the committee. The report was adopted by the meeting, and the officers of the section were instructed to see that this report receives wide publicity. The Council of the American Chemical Society has approved this report for publication.

Discussion of this report, and that on the jar-ring situation, brought out the need of a committee to investigate the relation of the rubber industry to public health. This matter was referred to the chairman, with power to act.

REPORT OF THE EXECUTIVE COMMITTEE.

The executive committee report, in the absence of Dr. Weber, chairman, was read by the secretary, and was adopted. In this report Dr. Weber stated that he would be unable to continue as chairman of the rubber section, and had therefore presented his resignation to the president of the American Chemical Society.

It was announced that the rubber section has no authority to elect officers, but that its officers are appointed by the president of the Chemical Society. However, in accordance with a previous understanding between Mr. Tuttle and Dr. Parsons, the secretary of the Chemical Society, the meeting proceeded to the election of candidates for the offices of chairman and secretary. The president of the American Chemical Society in the past has always approved of the choice of the section. The election resulted in the nomination of the following: chairman, John B. Tuttle, Firestone Tire and Rubber Co., Akron, Ohio; secretary, Arnold H. Smith, Bureau of Standards, Washington, District of Columbia.

A meeting was held September 12, to discuss informally the subjects which had been brought up the previous day, and to discuss plans for the coming year. At this meeting it was decided that it would be advantageous to prepare standard methods

for making physical tests and the chairman was instructed to appoint a committee for this purpose.

The attendance at Wednesday's meeting was about eighty, and would have been greater had the room been larger.

Among those present were the following:

John R. MacGregor, Eagle-Picher Lead Co., Chicago, Illinois.
 L. J. Plumb, United States Rubber Reclaiming Co., New York City.
 Frederick Dannerth, Newark, New Jersey.
 C. C. Stokes, Sears, Roebuck & Co., Chicago, Illinois.
 D. C. Kratz, Falls Rubber Co., Akron, Ohio.
 Cole Goodridge, Falls Rubber Co., Cuyahoga Falls, Ohio.
 Arthur H. Flower, Falls Rubber Co., Cuyahoga Falls, Ohio.
 Charles P. Fox, Municipal Laboratories, Dayton, Ohio.
 W. D. Pardee, Thermoid Rubber Co., Trenton, New Jersey.
 Walter H. Juve, The B. F. Goodrich Co., Akron, Ohio.
 Frank P. Brock, Redman Chemical Products Co., Chicago, Illinois.
 D. F. Cranor, Conshohocken, Pennsylvania.
 A. H. Smith, Bureau of Standards, Washington, District of Columbia.
 W. H. Hayt, Eagle-Picher Lead Co., Chicago, Illinois.
 Geo. P. Loomis, The B. F. Goodrich Co., Akron, Ohio.
 A. C. Cosler, The B. F. Goodrich Co., Akron, Ohio.
 W. L. Smith, The B. F. Goodrich Co., Akron, Ohio.
 Charles M. Knight, Akron, Ohio.
 M. M. Harrison, Miller Rubber Co., Akron, Ohio.
 R. J. Bonstein, Kelly-Springfield Tire Co., Akron, Ohio.
 C. P. Devine, Habersham Electric Cable Co., Yonkers, New York.
 John Young, Firestone Tire & Rubber Co., Akron, Ohio.
 V. C. Britton, Firestone Tire & Rubber Co., Akron, Ohio.
 E. W. Oldham, Firestone Tire & Rubber Co., Akron, Ohio.
 A. B. Merrill, The B. F. Goodrich Rubber Co., Akron, Ohio.
 H. B. Kohler, The B. F. Goodrich Co., Akron, Ohio.
 P. R. Monahan, Rubber Insulated Metals Corp., Plainfield, New Jersey.
 E. H. Gruffen, Manhattan Rubber Manufacturing Co., Passaic, New Jersey.
 B. Waite, The Goodrich Tire & Rubber Co., Akron, Ohio.
 H. G. Passee, General Tire & Rubber Co., Akron, Ohio.
 C. A. Norris, Mechanical Rubber Co., Cleveland, Ohio.
 P. Peterlin, Mechanical Rubber Co., Cleveland, Ohio.
 H. M. Koelliker, Mechanical Rubber Co., Cleveland, Ohio.
 T. D. Morron, Mechanical Rubber Co., Cleveland, Ohio.
 W. H. Cope, Lee Tire & Rubber Co., Conshohocken, Pennsylvania.
 W. W. Evans, The B. F. Goodrich Co., Akron, Ohio.
 Herman H. Lowenstein, Chemical Warfare Service, Nashville, Tenn.
 D. D. Herly, Federal Rubber Institute, Milwaukee, Wisconsin.
 Lieut. Roscoe M. Gage, The B. F. Goodrich Co., Akron, Ohio.
 G. Lloyd Allison, The B. F. Goodrich Co., Akron, Ohio.
 V. C. Ashman, Bradley Polymers Institute, Peoria, Illinois.
 Helen C. Gillette, Prest-O-Lite Co., Indianapolis, Indiana.
 Zeuzo Kemski, Osaka Shosen Kaisha, New York City.
 W. H. Hewlett, Babcock Rubber Co., Elkhart, Indiana.
 B. A. Allison, Barker Asphalt Paving Co., Madison, Illinois.
 W. S. Kimley, Hewitt Rubber Co., Buffalo, New York.
 L. A. Hoffman, The B. F. Goodrich Co., Akron, Ohio.
 P. H. Henkel, Continental Rubber Works, Erie, Pennsylvania.
 W. Scott, The Goodrich Tire & Rubber Co., Akron, Ohio.
 T. Kimishima, Imperial University of Japan, New York City.
 J. H. Link, Faultless Rubber Co., Ashland, Ohio.
 J. Silley, The Goodrich Tire & Rubber Co., Akron, Ohio.
 M. M. Kahn, Kelly-Springfield Tire Co., Akron, Ohio.
 A. H. Peterson, Kelly-Springfield Tire Co., Akron, Ohio.
 J. Simmons, University of Akron, Akron, Ohio.
 C. W. Sanderson, The Fisk Rubber Co., Chicopee Falls, Massachusetts.
 E. G. Marshall, Fort Madison, Iowa.
 G. S. J. Dalton, Mansfield Tire & Rubber Co., Mansfield, Ohio.
 K. I. Thompson, Columbian Tire & Rubber Co., Columbiana, Ohio.
 George Oenslager, The B. F. Goodrich Co., Akron, Ohio.
 John B. Tuttle, The Firestone Tire & Rubber Co., Akron, Ohio.

THE FOURTH NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES.

THE Fourth National Exposition of Chemical Industries was held in the Grand Central Palace, New York, the week of September 23. Over 350 exhibitors participated and their displays covered three floors. Practically all of these exhibitors had a bearing on the production of war material. The opening address of Dr. Charles H. Herty, chairman of the exposition's advisory committee, outlined the growth of the industry, showing its present position statistically, as regards exports in a few lines only, and indicating the possibilities for the future, and the invaluable aid the young dyestuff industry is rendering in the production of toxic materials for war purposes.

The daily program included symposiums on chemical topics and the exhibition of a large variety of moving pictures, changed each day, and covering a wide range of chemical and metallurgical manufactures and waterpower development.

Among the many instructive exhibits, those in the following list had special interest for the rubber manufacturer:

BARBER ASPHALT PAVING CO., Philadelphia, Pennsylvania, manufacturers of asphaltic products, among them Genasco brand mineral rubber.

THE BRISTOL CO., Waterbury, Connecticut, whose recording

thermo-meters and pressure gages are in use in practically every rubber mill. The output of this company includes their well-known recording instruments for temperature and time, with special fittings to adapt them to meet the requirements in rubber work; also new strip-chart type recorders and the Bristol patented safety set-screw. The total output of the latter is devoted to United States Government needs.

BUFFALO FOUNDRY AND MACHINE CO., Buffalo, New York, occupied a very large area in which was shown a line of heavy machinery such as vacuum dryers of commercial and laboratory size for rubber and other work.

J. H. DAY CO., New York City, exhibited their line of mixers with tight-fitting covers to conserve solvents, all of which find use in rubber mills where much cement is prepared.

J. P. DEVINE CO., Buffalo, New York, exhibited a few representative pieces of apparatus, which included a commercial size vacuum dryer and one for laboratory use. They also had on view a water still and a particularly heavy autoclave with mixing attachment.

HARRISON WORKS, Philadelphia, Pennsylvania. Extensive lines of paints and colors formed a portion of the extremely interesting and varied exhibition by E. I. du Pont de Nemours & Co. Zinc oxide, litharge and various other compounding ingredients of special purity and fineness for rubber makers' use were to be seen.

HUNTER DRY KILN CO., Indianapolis, Indiana, showed a model front end of their kiln, featured for the drying of rubber and equipped with direct reading hypometer. The results of the Hunter system of drying as exhibited in samples of crude rubber were extremely interesting. The process has advanced in favor very rapidly since its introduction to the rubber trade, and is now in use in practically fifty American rubber factories.

DR. FREDERICK MAYWALD, F. C. S., New York City, featured his analytic and rubber experimental laboratory in a series of photographic views, and in an informing circular set forth particularly the needs of the small manufacturer for chemical service.

NEW JERSEY ZINC CO., New York City. There is probably no rubber manufactory in America where the product of this company is unknown. Their exhibit set forth their products in an effective and interesting manner.

SCHAEFFER AND BUDENBERG MANUFACTURING CO., Brooklyn, New York, made an interesting display of pressure gages, thermo-meters and recording instruments adapted to every manufacturing need in such particulars.

F. J. STOKES MACHINE CO., Philadelphia, Pennsylvania, exhibited chemical machinery, rotary vacuum disks, and solvent recovery apparatus of interest in drying compounds, scrap rubber, etc.

WERNER & FLEIDERER CO., Saginaw, Michigan, exhibited their complete line of mixers for rubber and other work in neat laboratory sizes very convenient for examination and demonstration.

EXPORTS FROM BRITISH GUIANA.

From January 1, 1918, to May 30, 1918, the exports of balata amounted to 234,514 pounds, against 432,251 pounds for the same period last year—a considerable decrease, therefore. Figures for rubber exports over corresponding periods show an increase for the current year and are 5,831 and 4,935 pounds, respectively.

HONDURAS RUBBER EXPORTS.

During 1917, crude rubber to the amount of 35,156 pounds, value \$15,086, was invoiced at the United States consulate at Cuba and the agencies at Bonacca, Roatan, and Tela. The 1918 shipments to the United States from the same districts totaled 54,347 pounds, value \$33,004.

What the Rubber Chemists Are Doing.

STANDARD PLANTATION RUBBER.

A RESUME of the results of the investigation of Eaton and Grantham on the variability of plantation rubber has been published in the "Journal of the Society of Chemical Industry," by M. Barrowcliff, F. I. C., supplemented by a discussion of the M. C. T. process of coagulation. Details of this process will be found in *THE INDIA RUBBER WORLD* of April 1, 1918. The principal features of this paper are quoted below.

The reason for the obvious partiality shown by the manufacturer for Pará is that plantation rubber, even of the highest grades, varies in quality, the variations being considerably greater than those found in different samples of fine hard Pará. Much experimental work, dealing with the causes of this variability has been published, notably by B. J. Eaton and J. Grantham. It was found that it is almost solely in respect of the time of heating required to ensure correct vulcanization, that is, to afford a vulcanized rubber having the best mechanical properties, that the variations occur. Samples of plantation rubber, prepared by the different methods in general use, were found to require for the correct "cure" widely varying times of heating, at a constant temperature. Further, rubber made by the same process, on different estates, and at different times on the same estate, was found to vary greatly in this respect. When, however, the proper time of heating had been found and applied, relatively small differences were noted in the mechanical properties possessed by the vulcanized samples.

The fundamental fact established by Eaton and Grantham is that the same factor for correct vulcanization varies inversely according to the degree in which the rubber coagulum has been allowed to remain, subject to coagulation, unworked, and in contact with its serum. The longer this period the shorter the length of heating required to produce a correct cure.

Bearing this in mind, also the fact that the present custom is to machine the rubber on the day following coagulation, the influences exerted by the various factors introduced, in practice, into the manufacture of rubber from latex can be accurately foretold. The greater the extent to which the coagulum is machined, and the more completely the serum is consequently washed out, the slower the rate of "cure" of the rubber produced. This "crêpe" rubber, as now marketed, is the slowest to vulcanize. "Sheet" rubber, which receives a much less drastic machining and retains a considerable quantity of serum that drains out relatively slowly, cures in a much shorter time. "Slab," which receives no mechanical treatment, and in which 12 to 15 per cent of the moisture is allowed permanently to remain, vulcanizes still more quickly.

In the preparation of "smoked" rubber two variables are concerned: (a) the action of the smoke products; (b) the temperature of drying. The former retards the rate of cure, while the latter, within the limits attained in practice, accelerates it. Hence, "smoked" sheet may cure either faster or slower than similar smoked sheet, depending on the balance of these factors in the earlier stages of drying.

In the case of unsmoked rubber, the rate of drying similarly affects the vulcanization time factor. The same plantation drying-room may produce on different days, according to the temperature and atmospheric humidity, rubber having different rates of "cure," even if the moisture content of the wet rubber happens on each occasion to be the same.

The amount of serum left in "sheet" rubber depends on the machining it has been given. Eaton found that the more concentrated the latex, the more rapid is the rate of cure of the "sheet" afforded by it. The coagulum from the undiluted latex being thicker and harder, more serum is retained in it after the

"rolling" process; the rate of drying, consequently is slower than in the case of the thinner sheet afforded by the diluted latex, affecting in the way expected, the optimum time required for the "cure." Similarly, "differential" rolls and rolls of equal size and speed will produce sheet rubber requiring differing times of "cure," other factors being constant. The effect of employing acetic acid to coagulate the latex is to retard markedly the rate of cure. Little difference is occasioned, however, between acid-coagulated rubbers by variations in the amount of acid that has been used, within the limits met with in practice.

As is obvious from the foregoing, to produce a uniform rubber without some radical change in method would involve almost insuperable difficulties. One type of rubber only could be permitted. The way out of this difficulty is clearly indicated by Eaton and Grantham's further work.

It was found that the change which takes place in the rubber coagulum and causes the diminution in the time of heating required for vulcanization is completed in the course of a few days. Although the maximum effect appears to be attained about the seventh day, there is little change in the rate of vulcanization after three days, when the vulcanized rubber possesses the best mechanical properties. The slower progress of the changes in the coagulum, as compared with the slab is probably due to putrefactive changes having occurred. To obtain the best results the coagulum should be left unworked for three days. It is then immaterial to what extent the rubber is worked, in what form it is finished, or how quickly or slowly it is dried, the time of "cure" not being affected to any significant extent.

If, however, coagulation is carried out in the usual way with acetic acid in open vessels the rubber coagulum undergoes changes if kept such a length of time, which render the method unsuitable. Putrefactive action sets in, accompanied by darkening of the coagulum, while spot diseases which have been shown to cause an extraordinary retardation of "cure" are likely to develop during the subsequent treatment.

A new procedure is required, therefore, and seems to be furnished by the method introduced by M. Maude and W. S. Crosse, known as the M. C. T. process. It is based on the fact that in closed vessels latex coagulates completely without the addition of acid and without at the same time undergoing putrefactive changes. As now carried out in practice, large cement tanks provided with heavy water-sealed covers are used. These are filled with the bulked latex, leaving the smallest possible air space. The covers are affixed and sealed and left undisturbed until the following day, when the coagulation is found to be complete. The resulting coagulum is converted into "crêpe" in the usual manner.

Addition may be made to each 100 gallons of latex of a quantity of a soluble calcium salt, namely, calcium acetate or sulphate (gypsum), corresponding to four ounces of calcium. The effect of this is to accelerate the coagulation. A beneficial effect on the properties of the rubber may also be produced. In this connection the fact should be noted that whereas the soils of the Amazon region are well supplied with lime, those of the Malay peninsula are remarkably deficient in this respect. Further, the Pará method of coagulation favors the retention of calcium compounds in the rubber, while acid coagulation tends to remove them. These points may be not without bearing on the causes of such differences as may exist between Pará and plantation rubber.

Regarding his comprehensive series of tests of crêpe, unsmoked sheet, smoked sheet, and slab rubber made by the M. C. T. process, B. J. Eaton states: "All the samples possess excellent tensile properties, equal to the best samples of plantation sheet and

crêpe, and prove that the process is capable of producing rubber of excellent quality."

Eaton's tests show the remarkable uniformity of the sample of crêpe rubber, considering that they represent the produce of old and young trees; of pure latex and latex diluted with water, and of rubber made on different days. The rate of cure was found to be more rapid than in the case of the standard sample of crêpe, a result attributed by Eaton to the absence of acid.

The figures given by Eaton show that this method of coagulation affords, at least, rubber equal in all respects to the best now being produced by acid coagulation and of greater uniformity. The point upon which stress requires to be laid, however, is that it is a process, and seemingly the only practical one, by which the coagulum may be allowed to mature for the length of time essential for eliminating the differences that otherwise result from unstandardized subsequent treatment.

For the production of "standard" rubber the bulked latex from a day's tapping requires to be placed in the coagulating tanks, as described above, and allowed to remain undisturbed for a fixed time, which it is suggested, should be three days. Under these conditions no putrefaction occurs and the coagulum remains perfectly white, except for a slight surface darkening.

Judging by the considerations advanced above, the rubber so produced, whatever the source, or whether finished as crêpe or sheet, would show no variations in the time of heating required under standard conditions for correct cure, while the vulcanized material would possess the maximum attainable textile strength. The cure would be substantially quicker than that of Pará under similar conditions, but this is an advantage, as it enables the manufacturer, while heating for the same length of time, to vulcanize at a lower temperature, which is all to the benefit of the finished material.

The result of the general adoption of the above described method of operation would be the production of a plantation raw rubber as uniform in its vulcanizing properties as fine hard Pará, and one affording at least an equally satisfactory product.

CHEMICAL PATENTS.

THE UNITED STATES.

PROCESS OF MAKING A SUBSTITUTE FOR WHITING.—A product known as artificial whitening manufactured by processes similar to those employed in the conversion of natural chalk into whitening, precipitated chalk, or other forms of calcium carbonate. With such artificial whitening, either during or after its manufacture, an organic salt or soap is incorporated. The whitening if neutral is made to contain free alkali or lime and an organic derivative is added which will convert the free alkali or lime into a salt or soap. Such addition may consist of oleic acid, tannic acid, benzoic acid, or any of the higher organic fatty acids, or a phenol, such as carbolic acid, or alpha or beta naphthol. (Herman B. Kipper, Solvay, New York. United States patent No. 1,264,392.)

VULCANIZING OF RUBBER.—A method of accelerating a vulcanizing process which consists in adding to the rubber mixing an accelerator comprising caustic alkali dissolved in a hydroxy-organic compound forming a solvent which is not decomposed by the alkali. The solvent specified is glycerol or glycol. (Douglas Frank Twiss, Sutton, Coldfield, England, assignor to The Dunlop Rubber Co., Limited, Westminster, London. United States patent No. 1,271,810.)

PROCESS OF VULCANIZING RUBBER SHOES.—The articles are heated by the application of a heating medium applied to one side while maintaining the opposite side free from contact with a condensable heating medium, and when the article has been sufficiently heated to prevent condensation thereon, then subjecting the opposite side to a condensable heating medium at a vulcanizing temperature. (Charles E. Bradley, assignor to Mishawaka Woolen Manufacturing Co., both of Mishawaka, Indiana. United States patent No. 1,271,843.)

LABORATORY APPARATUS. FILTERING TUBE.

THE apparatus shown was designed particularly for handling those precipitates whose solubilities necessitate great economy with the liquid used for transferring and washing.

A straight glass tube, having a stopcock at its middle point, is sealed to a carbon filter tube. The latter is fitted with a two-hole rubber stopper. The stem of a Walter crucible - holder passes through one hole of the stopper while the other contains a right-angled exit tube. The connection leading to the suction pump is intercepted by an ordinary T-tube, the free end of which is joined to a short piece of rubber tubing as an air inlet.

In operation, the perforated crucible G with prepared asbestos felt, is set in collar W. Once adjusted, the suction needs no interruption throughout the filtration. When cock S and clamp M are closed, the tube C serves as a small filter flask. When Clamp M is opened and pushed past the shoulder onto the tube T, atmospheric pressure is restored within the apparatus; then on opening cock S, portions of the filtrate can be delivered into the original beaker. ("Journal of Industrial and Engineering Chemistry," by permission Chemical Director, E. I. du Pont de Nemours & Co.)

DYNAMOMETER.

The illustration shows the type of dynamometer used in the so-called "barbecue" test for determining the adhesion of soft

rubber to hard in solid truck-tires. It consists of a calibrated elliptical spring which flattens under the strain applied to the end loops, thus imparting motion to the indicating mechanism in the rear of the dial. The instruments have an extra pointer which is loose and which remains at maximum strain after load is released. Capacities vary from 500 to 5,000 pounds. (John Chatillon & Sons, New York.)

FISH SCALE RUBBER.

The "Scientific American" devotes much space to the success an inventor has attained in compounding fish scales and rubber. According to the tale, the compound vulcanizes and forms a tougher product than has previously been discovered. It is a thousand to one that fish scales as a compounding ingredient are no better than hundreds of other ingredients already in use. The fact is, anything dry can be incorporated with rubber, and the mass vulcanized. The test is what sort of a plastic, if any, can be produced from fish scales without rubber. If alone, they do not sheet and show resilience, the resilience found in the rubber and fish scale combination comes from the rubber and from nothing else.

When you buy War Savings Stamps you do not give—you receive.

The Allocation of Sulphur.

PRIOR to the taking over of sulphur by the United States Government, William G. Woolfolk, Commodity Chief, War Industries Board, asked The Chemical Alliance, Inc., a body representing the entire chemical industry, to furnish a concrete plan covering the allocation of brimstone, pyrites and coal brasses.

At a special meeting the directors of The Chemical Alliance, Inc., affirmed their desire to handle the allocation of sulphur materials and appointed a Committee on Production, Distribution and Control of Sulphur Materials to work out the details of the plan to serve Mr. Woolfolk in an advisory capacity in carrying out the authority conferred upon him by the War Industries Board. The committee consists of three directors of the Alliance, as follows: A. D. Ledoux, chairman; W. D. Huntington, and C. G. Wilson.

In order that the trade may be advised of the proper method of procedure to get sulphur-bearing materials, the following statement has been issued by The Chemical Alliance, Inc.:

Because of the shortage of pyrites, due to the curtailment of Spanish ore, made necessary for the conservation of shipping, the War Industries Board has for months past been giving serious consideration to the question as to the best method of dealing with the important subject of sulphur materials.

The Chemical Alliance, Inc., being a body representing the entire fertilizer and chemical industries, and very closely associated in an advisory capacity with all government departments interested in the promotion of chemical manufacture and agriculture, was asked by the War Industries Board to furnish a concrete plan for handling sulphur materials.

It will be noted that the War Industries Board has taken full control of all sulphur materials by the following resolution:—

Due to the increased demand by the Government for sulphur, in the manufacture of explosives and for other purposes, and to the increasing burdens on the rail and water transportation systems, control of the production and distribution of sulphur materials has become necessary to insure, as far as possible, an adequate supply to the Government and an equitable distribution of the surplus to other users; therefore be it

Resolved, That the War Industries Board will assume control of sulphur materials, and hereby authorizes Mr. William G. Woolfolk, commodity chief in charge of pyrites and sulphur, to act for the board in controlling the production and distribution of sulphur materials, availing of such voluntary assistance as he may see fit of individuals or committees representing the producers and users of sulphur materials, and, in case any producer or consumer declines to abide by the decision of the War Industries Board, commanding orders will be issued where necessary.

It is the duty of the committee to obtain from producers and consumers such information as is thought necessary to enable satisfactory sulphur materials. The committee's work will be materially lightened if all producers and consumers will furnish the information which may be asked for without loss of time, and meet the situation in the same patriotic manner as they are now doing in other matters.

Inquiries, including the matter of sale or purchase of sulphur materials, should be addressed to the Committee on Production, Distribution and Control of Sulphur Materials of The Chemical Alliance, Inc., at either room 135, Interior Building, Washington, District of Columbia, or 15 William street, New York City.

The work of this committee is now well under way. Detailed information is being acquired regarding the production or consumption of all firms concerned, stocks on hand, amounts needed, transportation facilities and increased production problems, and the committee is rapidly placing itself in a position to allocate material and assist industries using sulphur materials while still making certain that the government war program shall not suffer. Allocation will be by agreement as nearly as possible, since it is the desire to depend

largely on the cooperation and patriotic spirit of those concerned. It is only when an improper spirit is shown that drastic action may be necessary.

The chairman, A. D. Ledoux, states that such alarming articles as have recently appeared in the daily press regarding an alleged sulphur shortage are misleading and unfortunate. There is no shortage in the sense that the material is giving out, but it is difficult to obtain under present conditions of transportation and labor. We have hardly begun on the great brimstone deposits of Louisiana and Texas; numerous producers of pyrites east of the Mississippi will furnish a large supply in the aggregate, and there are heavy deposits of pyrrhotite to be resorted to if necessary. The problem is largely a matter of allocation of our supplies and transportation, essential uses naturally being given first consideration. Very large stocks of sulphur, Mr. Ledoux asserts, are already mined, and from the present outlook the rubber trade need have no uneasiness in regard to its supplies.

All users of sulphur, however, should realize that while the present outlook shows a sufficient supply for our essentials, it should not be wasted, and an earnest effort should be made to conserve its use to the greatest possible extent. As in the case of crude rubber, steel, sugar, and all basic materials, we are expected to do our utmost to produce, utilize and conserve the materials which are nearest available and so assist the transportation problem by rail and water, which after all is the real difficulty, and thereby facilitate increasing the flow of troops and supplies to France. It is not logical to haul material a thousand miles where there is other material close by the manufacturer's plant. It is not right that one firm should pile up heavy stocks to last for many months while another firm not far off is suffering because of inadequate stocks. In such an instance, a producer would be expected to ship his material to the one who needed it, and the manufacturer having the large stocks would be expected to stop receiving more until matters were evened up. It is along these general lines that the committee intends to work, and both Mr. Ledoux and Mr. Woolfolk are the sort of men who can be relied on to exercise their authority fairly and wisely in keeping industries running.

UNDEVELOPED SULPHUR DEPOSITS.

In response to the editorial and article on the sulphur situation in THE INDIA RUBBER WORLD OF AUGUST 1, 1918, the following letter has been received:

As the writer is in touch with the owners of certain sulphur deposits, would it be possible for you to give me the names of corporations seeking independent sulphur supplies for their own needs, as referred to in the last paragraph of your editorial? Or, any other means you might suggest whereby we could place the sulphur deposits to the benefit of the industry.

SULPHUR CAN BE SAVED IN RECLAIMING SCRAP RUBBER.

In a recent letter to the Editor, a prominent chemist of the Middle West expresses himself as follows:

In the August issue of your valuable paper you refer to the restriction on the use of sulphur and seem to make light of it, as research and science have proved that it can be replaced. It is all right to keep on smiling, even if you hear some unpleasant news. But the fact will not be changed that the place of sulphur will not be taken by any other substance—at least for the duration of this war. All that we can do is to save sulphur, use it more economically and not waste it.

In giving out the slogan, "Don't waste sulphur," I am thinking of the enormous amounts of sulphur in scrap rubber which are destroyed by the reclaiming process. This sulphur can be saved in numerous cases and a very high-grade reclaimed is obtained. You were referring to this process in THE INDIA RUBBER WORLD about eight months ago.

New Machines and Appliances.

ENGLISH TYPE SINGLE-GEARED MIXER.

SEVERAL novel features in heavy mill construction are embodied in the single-gear mixer shown in the accompanying illustration. The rolls, 22 inches front and 26 inches back, by 84 inches wide, are of chilled cast iron, the working faces being ground and polished. The necks of the rolls are 10 inches in diameter and journaled in heavy boxes, lined with the best phosphor bronze. Sight-feed lubricators supply oil to the bearings and large steam inlets and outlets of an improved type are provided. The massive cast-iron side-frames that support the rolls are fitted with strong steel caps and the frame-arms are bolted to a heavy cast-iron bed plate, six inches deep. The rubber compound guides are of an improved adjustable type, provided with a steel stay-bar that takes up the thrust on the guides during mulling operations. The roll-adjusting screws are of large diameter with square threads and equipped with capstan heads for large roll-adjusting bars. The cast-iron safety nuts are designed to fracture when the strain on the machine is excessive.

The main driving-gear, which is a cast-iron machine-cut spur-gear with 14-inch face and $3\frac{1}{2}$ -inch circular pitch, is keyed to the back roll and driven by a machine-cut steel pinion on the floor-shaft and operated by a dog or claw-clutch. The

pinion can be made to slide on the shaft if two or more mills are arranged on one line. The front roll is driven from the back roll and the herring-bone gears are cast-steel, machine-molded with long teeth to allow for roll adjustment. They are 14 inches wide and three-inch circular pitch. (David Bridge & Co., Limited, Castleton, Manchester, England.)

UNIVERSAL LABEL-PASTING MACHINES.

These machines afford a quick and efficient means for applying paste to labels or, in fact, to any surface, thereby doing away with the unsanitary paste pot and brush. One type of machine is designed to apply paste to the edges of surfaces, and another is used to moisten gummed labels up to 5 inches in width. This machine is also adapted for moistening stamps where large quantities are used.

The operation is quite simple and requires only ordinary intelligence to produce satisfactory work in quantity. All that is required is to remove the front cover, fill the paste box about one-half full, and replace the cover. The label is then laid on the front plate and fed between the rolls that are operated by a motor-drive, or by hand power if so desired. The amount of paste is regulated by adjusting the feed-roll scraper located in the paste box.

These machines are furnished with motor-drive in three sizes, operated by direct or alternating current or by hand, No. 1 taking labels up to five inches wide, No. 2 up to eight

inches wide, and No. 3 up to twelve inches wide. The No. 4 machine applies paste to the edge of a sheet or wrapper over a space from $\frac{1}{8}$ -inch to $3\frac{1}{2}$ inches wide. The No. 5 machine is used for applying water to gummed labels or stamps and the No. 6 machine is an improved model with the same dimensions as machine No. 1. (A. G. Prior, 665-671 Broad street, Newark, New Jersey.)

BRAKE-LINING TESTING MACHINE.

The production of brake lining has become a firmly established branch of the rubber industry and manufacturers are supplying the automobile trade and makers of machinery requiring clutch facings with a material that will withstand severe usage under varying conditions.

A special testing machine that has been designed to determine the wearing resistance of brake linings, subjects the material to a wearing pressure of 50 pounds to the square inch for a period of 20 hours, and at a temperature of 212 degrees. The percentage of wear shown in this test indicates the heat-resisting quality of the fabric and the absence of combustible material in the

brake linings. Furthermore, the machine is arranged so that the lining can be subjected to any pressure and immersed in oil or water, or covered with dirt, and by a system of weights it is possible to determine exactly the amount of pressure required to bring a car of any weight to rest in any space. (Standard Woven Fabric Co., Walpole, Massachusetts.)

HYDRO AIR-COMPRESSOR FOR
INFLATING TIRES.

The possibility of oil being carried into rubber tires with the air when a power driven air-compressor is used, may be obviated by the use of a compressor operated by water pressure. The standard garage air-compressor here shown will deliver clean air at any desired pressure, no reducing valve or other device being used. The makers claim that the standard compressor will deliver 40 cubic feet of free air per hour at 105 pounds up to 110 pounds, at water pressure of 75 pounds; 35 cubic feet with 65 pounds of water; 30 cubic feet with 50 pounds of water; 27 cubic feet of free air with 50 pounds of water. All air pressure same as first named. (The Dunn Hydro Co., Denver, Colorado.)

AERO AUTOMATIC FIRE ALARM SYSTEM.

This system is built on the principle that air expands with the application of heat. In applying this principle, loops of fine

copper tubing, spaced twenty feet apart, are affixed to the ceiling of the factory or warehouse. These loops vary in length with a maximum of one thousand feet according to the local conditions. The loop, or aero circuit, terminates at both ends in a flexible silver diaphragm. Expansion of the air in the tubing bulges the diaphragm outwards and makes an electric contact with a fixed-point contact screw. The making of this contact closes an electric circuit, causing the bells and other signals to operate effectively.

Whenever there is a variation in the temperature of the atmosphere the pressure in the aero tubing correspondingly fluctuates. The pressure increases with the increased temperature and decreases with the decreased temperature. To prevent unnecessary alarms an instrument called a "compensating leak valve" is inserted between the diaphragm and the aero circuit. Its function is to allow the pressure in the tubing to equalize that of the air outside the tubing until actual fire conditions exist.

The alarm bells do not ring, except under fire conditions, because a pressure sufficient to affect the diaphragm and to make an electric contact cannot be attained until the growing pressure in the tubing exceeds the equalizing capacity of the leak valve. Herein lies the value of the system; it is sensitive to fires at their inception, sounding the alarm when the fire can be extinguished with the fire buckets and plant extinguishers. Each fire area has its own distinctive code signal. (Aero Alarm Co., 26 Cortland street, New York City.)

CAST HIGH-SPEED STEEL BY NEW PROCESS.

The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, has recently built a new foundry, 50 by 75 feet, in which to manufacture high-speed steel which is made by blast firing by a special process and then cast. This is one of the first attempts to cast high-speed steel. The foundry has a maximum capacity of 1,000 pounds daily.

MACHINERY PATENTS.

CALENDER ADAPTED FOR FILLING MOLDS.

MOLDS are filled with rubber or similar composition by passing them between the bottom rolls *A* and *A'* of a three-

roll calendar. The bearing-blocks *B* of the roll *A* are adjustable by means of eccentrics *c* mounted upon shafts adjustable by worm gearing *c'*, *C'*. The blocks *B* are mounted upon supports *E* having resilient pads *e* of rubber that are adjustable by gearing *c'*. Tables *D* and *D'* for the feeding and delivery of the molds are attached to the bearings *B*; or conveyors may be used. (A. F. Hawkins, Spring Bank, Hough Lane, Leyland, Lancashire, England. British patent No. 116,787.)

OTHER MACHINERY PATENTS. THE UNITED STATES.

- N^{O.} 1,274,573. Device for shaping and vulcanizing automobile tire patches. A. L. Murray, assignor to The Double Fabric Tire Co., all of Akron, O.
1,274,465. Machine for inserting cross-wires in solid tires. W. C. Stevens, assignor to Firestone Tire & Rubber Co., all of Akron, O.
1,275,491. Collapsible tire-core. C. Stein, Akron, O.
1,275,858. Tire core. V. L. Cox, assignor of one-half to A. Schonenberger—both of Akron, O.
1,275,072. Tube-wrapping machine. J. G. Moomy, Erie, Pa.
1,275,794. Tire-building machine with revolvable core. J. D. Thomson, assignor to The Goodyear Tire & Rubber Co.—all of Akron, O.

THE DOMINION OF CANADA.

- 184,498. Sectional core for making inner tubes. The Mercer Tire Co., assignor of H. Dech—both of Trenton, N. J., U. S. A.
184,563. Tire-wrapping machine. O. E. Heckman, Akron, O., U. S. A.

THE UNITED KINGDOM.

- 116,774. Means for collapsing tire cores. Wood-Mine, Limited, Ribbles Bank Mills, Preston, and W. Ford, Meadow street, Leyland, Lancashire.
117,005. Mixing machine for plastic substances. J. E. Pointon and Perkins Engineers, Limited, Westwood Works, Peterborough.
117,097. Machine for extruding plastic rubber, etc., in pipe or other form. J. Stratton, The Lindens, Winton Road, Rowdon, and E. A. Claremont, Broom Cottage, High Legh—both in Cheshire.

THE FRENCH REPUBLIC.

- 480,595. Apparatus for vulcanizing. A. Robert, A. Dessaully, and A. Barber.

PROCESS PATENTS. THE UNITED STATES.

- N^{O.} 1,274,496. Tire-casing manufacture. R. J. Arens, assignor to The Goodyear Tire & Rubber Co.—both of Akron, O.

THE UNITED KINGDOM.

- 116,674. Method of manufacturing seamless rubber hot-water bottles. G. Cain, 16 Whitford Gardens, and Mitcham Rubber Co., Morden Road—both in Mitcham, Surrey.

A NEW DIVIDED DEMOUNTABLE RIM.

A divided demountable rim is the invention of Joseph Stungo, of Edinburgh, Scotland, who has spent practically a life-time in the tire and rubber business. It is most simple in construction and requires no special wheels, as it will fit any wheel made for a detachable rim. All that is necessary with this rim is to open four hooks on the inside, which may be done with the fingers, and one-half of the rim lifts off, leaving the casing exposed for the removal of the inner tube. The repair being made, the half-rim is replaced and the hooks slipped over the pins, when the rim is ready for service. It can be easily adjusted by an inexperienced person without the use of tools. The rim is owned by the American Rim, Tire & Rubber Co., Pittsburgh, Pennsylvania, a Delaware corporation.

The Editor's Book Table.

COTTON AND OTHER VEGETABLE FIBRES: THEIR PRODUCTION and Utilization. By Ernest Goulding, D. Sc., F. I. C., with a preface by Wyndham R. Dunstan, C. M. G., LL. D., F. R. S. John Murray, London, England. (Cloth, 8vo, 231 pages, illustrated. Price, 6 shillings, net.)

THIS volume of the Imperial Institute Handbooks to the Commercial Resources of the Tropics consists primarily of an exhaustive study of cotton as the most important of vegetable fibers. Sections are devoted to a description of the cotton plant; an account of the structure and composition of the fiber; methods of cultivation with details of the cultural systems adopted in the United States and Egypt, diseases and pests, and the preparation of cotton for the market. Particulars are given as to the production and varieties of cotton in the chief cotton-growing countries of the world, including the United States, Egypt, India, Peru, Brazil, Mexico, Asiatic Russia, China, Japan, and various British colonies, together with statistics of trade and market prices.

THE PHILIPPINE JOURNAL OF SCIENCE, CONTENTS AND INDEX, volume I (1906) to volume X (1915). Bureau of Science, Department of Agriculture and Natural Resources, Manila, Philippine Islands. (Paper covers, 7 3/4 by 10 1/2 inches, 442 pages. Issued free to subscribers, having volumes XI and XII of "The Philippine Journal of Science"; price to others, \$2 United States currency.)

This comprehensive list of contents and index to the first ten volumes of "The Philippine Journal of Science" has been in preparation since 1915 and consequently purports to be complete in its inclusion of everything which has been published in the "Journal," together with correction of errors and omissions from the yearly indices. The book contains the table of contents, and author and subject indices, so that any article can be readily located.

REPORT OF THE CEYLON CHAMBER OF COMMERCE (INCORPORATED) for the year ended 31st December, 1917. (Paper cover, 247 pages, charts, tables.)

A preliminary survey of trade in general, freight and important legislation, is followed by a more detailed report of business in the chief commodities imported and exported, rubber being included among the latter. Tables of imports and exports, average prices obtained for Ceylon products and a chart showing the weekly rise and fall in the prices and quantities of rubber of all grades offered at local auctions during 1917 amplify the statements in the report. Correspondence on important measures taken by the British and local governments cover, among other subjects, rubber export restrictions, the packing of rubber, and shipping regulations. Lists of members and of officers past and present, justices of the peace, holidays for the year 1918, arbitrators and surveyors, and the minutes of the general meeting, complete the volume.

A VALORIZAÇÃO DA BORRACHA E O PROCESSO DE COAGULAÇÃO "Cerqueira Pinto." Associação Commercial de Pará, Pará. (Paper cover, 29 pages.)

In view of the fact that the Brazilian Government is attempting to help the rubber industry, whose condition is causing much concern, by urging the adoption of the coagulating process known by the name of the inventor, Dr. Cerqueira Pinto, the Associação Commercial do Pará has addressed this pamphlet of protest to the Minister of Agriculture, Industry and Commerce.

The association points out that in spite of the fact that Dr. Pinto's method was first introduced in 1913, it has not succeeded at all in displacing the primitive process of coagulation in use. Investigations at that time showed that rubber prepared with Dr. Pinto's coagulant equalled plantation crêpe, but was inferior to smoked fine Pará. Various foreign authorities are quoted to show that the process of smoking, which

would be abandoned where the "Cerqueira Pinto" preparation was employed, is in fact responsible for the superior quality of Pará rubber. Consequently, the association is of opinion that so far from discouraging coagulation by smoking in favor of the proposed chemical preparation, the Government should aim at improving the existing method by promoting the use of simple and cheap machinery to facilitate the labor of the *seringueiro* and at the same time to protect his health.

TECHNISCHE ANALYSEN. BY DR. IR. H. I. WATERMAN. Technische Boekhandel G. van Herwinen, Dordrecht, Netherlands. (Paper cover, 36 pages, diagrams.)

This little book is intended as a manual for practical exercises in the chemical laboratory, and discusses a dozen different subjects, among which may be mentioned the examination of lubricating oils, heat of combustion of solids, liquids, and gases; examination of white of lead, ultramarine, lithopone, zinc white, ochre, water, and copper sulphate.

NEW TRADE PUBLICATIONS.

THE MORSE CHAIN CO., ITHACA, NEW YORK, HAS RECENTLY published a booklet of data sheets containing useful information regarding silent chain drives. It is illustrated with cuts of engines and drives, covering the subject of the number of teeth and links, lubricating and venting, sprocket materials, chain widths, chain contacts, chain adjustments, etc. It will be sent free on request.

"THE RUBBER LEAF" IS A 24-PAGE MONTHLY PUBLISHED BY THE employees of the McGraw Tire & Rubber Co., East Palestine, Ohio. It is ably edited by W. E. Palmer, and contains, aside from breezy personal mention, much good humor and helpful suggestion.

* * *

THE STENOGRAPHIC REPORT OF THE PROCEEDINGS AT THE luncheon given by The Rubber Association of America, Inc., for the War Service Committee of the Rubber Industry of the U. S. A., July 31, 1918, at the Waldorf Astoria, New York City, has been published as a permanent record in pamphlet form by the Association.

* * *

"NUMBER FORTY," AN ILLUSTRATED MONTHLY NEWSPAPER FOR druggists, published by the Faultless Rubber Co., Ashland, Ohio, has made its first appearance, dated September. While featuring "Weavever" sundries, it aims to present rubber news and sales methods of interest and value to the drug trade.

* * *

"HOW TO INCREASE TIRE MILEAGE," IS THE TITLE OF AN attractive illustrated pamphlet of 64 pages which has been issued for distribution among its patrons by the Firestone Tire & Rubber Co., Akron, Ohio. Responding to the urgent necessity of the times to make pneumatic tires perform their utmost service, this little handbook tells in detail by word and picture how to select the right tires and tubes, how to use, care for and repair them, and shows the result of neglect in each instance.

* * *

"THE DUTCH EAST INDIAN ARCHIEPELAGO" IS A MONTHLY commercial publication recently started in Java and printed in English. J. Veersma, Batavia, is the editor, and A. A. van der Kolk, Buitenzorg, is the publisher.

The aim of the journal is to present to enterprising foreigners all possible information regarding the Dutch colonies, with the idea of promoting new relations between these parts and the rest of the world.

Interesting Letters From Our Readers.

ONE HUNDRED THOUSAND ACRES OF RABBIT BUSH.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR:—In your article, "The United States Can Produce Its Own Rubber," reprinted in part by the "Literary Digest," you refer to getting rubber from rabbit bush. I am sending you a sample to test and advise me if it contains much rubber, as I know of 100,000 acres of rabbit bush. This place I refer to consists of 165,000 acres, but I allow 65,000 acres as likely to be clear or covered with other bushes. This bush grows at an elevation of 4,000 to 5,000 feet and stands between four and six feet in height. The sample is between five and six feet. Does the strong odor have anything to do with the rubber? There is water to be had if necessary. Can you give me the name of a rubber company to which I may write? Will you be so kind as to forward to some interested company the sample of rabbit bush which I am sending to you?

Thanking you for your attention, I remain,

Very respectfully,

MRS. FLORENCE E. DAVIS.

Los Angeles, California.

MORE REGARDING AMERICAN-GROWN RUBBER.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR:—The interesting article, "The United States Can Produce its own Rubber," in the June issue of THE INDIA RUBBER WORLD, unlocks some valuable information concerning the possibilities of another source for the production of crude rubber in Northern America.

The article and the editorial comment emphasize a vital need; and they go far towards lifting the veil of uncertainty that has clouded the horizon of a new and needed industry.

Waiving the claims of guayule and pingüé as being the most valuable native plants for the purpose indicated, and assuming that their value as economical producers of crude rubber is entirely too dependent upon the influence of irrigation on the quality and quantity of the caoutchouc, we can take up a discussion of the Hall-Goodspeed discoveries and add a few words of confirmation.

The two plants mentioned, the giant rabbit bush, (*Chrysothamnus*) and the dwarf rabbit bush, (*Ericameria*)—belong to the great *Compositae* family, and are relatives of the guayule (*Parthenium*) and pingüé (*Actinella*). Both of the new plants contain rubber and allied compounds. In certain qualities they both excel the latter plants. The natural growth of both the guayule and pingüé is limited by local factors of altitude, moisture and wind. Both of these new sources of crude rubber, especially the giant rabbit bush, have a much wider range of territory, altitude and soil selection. The giant rabbit bush is a foot-hill or mountain plant which selects dry rocky places along or in the beds of dry gullies. It is not very abundant. The dwarf rabbit bush is an inhabitant of the plains, is very abundant, and can be readily propagated. A most valuable characteristic of this plant is its ability to thrive on alkali flats. It is also drought-resisting to a marked degree.

We grant without discussion the claims for these plants concerning their abundance, range or territory, and suitability for cultivation under the most adverse conditions. As to their value as producers of rubber of a grade better than or even equal to that of guayule, I am not so confident. Of the two plants, the quality of the giant rabbit bush product seems to be a shade better. The product from the dwarf rabbit bush is inferior, being tacky; but the yield is larger and there is also a valuable resin and essential oil.

However, the soft character of this rubber may have been caused by a depolymerization due to storage of the dry plant previous to extraction. Under these conditions such a change takes place in guayule. In the matter of priority of discovery of rubber in these plants, there will exist a doubt.

The smaller bush is known as "grease wood" on account of its burning qualities, and the stain made upon dry soil by an exudation from the plant. From a description of the plant, the writer is inclined to the opinion that it is the same plant worked by Werner and Ellis, who obtained a patent covering their process and product in 1902. In 1903, while investigating the Colorado rubber weed (pingüé), the writer had both of these plants under observation. Laboratory results, obtained from samples of these plants from southern Colorado, balanced against yield and nat-

ural supply, and other economic factors, were not of sufficient importance to warrant a venture in their direction. About 1905, a sample of the dwarf rabbit bush was forwarded to the Diamond Rubber Co., Akron, Ohio, from Silver Creek, Colorado. This sample also contained a small amount of rubber, much resin and an essential oil. The resin would be of value in frictions and the essential oil useful in scenting soap. The resin being of the saponifiable type, it can be made directly into a natural-scented soap. As these oils are usually highly antiseptic, such a soap may have considerable medicinal value.

At the request of Mr. Pearson, of THE INDIA RUBBER WORLD, I prepared a few notes concerning "Possible Rubber Producers in the Temperate Zone." This paper was read at the Third International Rubber Conference, New York, 1912, and published in THE INDIA RUBBER WORLD, June 1, 1913. Under the name "Strobel's Rubber Plant" (named in recognition of the collector), mention is made of a shrub now identified by means of the excellent photographs reproduced in THE RUBBER WORLD as the dwarf rabbit bush.

I am glad that the California Section of the National Council of Defense, through the University of California, has taken hold of the matter. I am again glad to know that the work is being carried out by Professors Hall and Goodspeed. During the past decade Professor Hall has aided me in identifying and obtaining interesting plants in my search for rubber producers. With the aid of THE INDIA RUBBER WORLD, I am certain that the goal is in sight.

Yours sincerely,

CHARLES P. FOX.

Cleveland, Ohio.

THE RUBBER FACTORY IN SCHOOL TEXTBOOKS.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR:—It has recently come to my attention that a section of your article on "Vocations" under the heading of "Rubber," which appeared in volume IV of the Young Folks' Library, published by Hall & Locke Co., Boston, has been given a new title, "In the Factory," and incorporated in the Riverside Seventh Reader, published by the Houghton Mifflin Co., Boston.

Rarely is the work of a writer for the technical or trade press classed as literature and accorded a place in book form beside selections from such gifted pens as those of Longfellow, Bryant, Stevenson, Holmes, Thomas Bailey Aldrich, and John Burroughs. May I not congratulate you on this well-merited distinction?

Sincerely yours,

MADISON R. PHILLIPS.

Boston, Massachusetts.

CANADIAN SOLDIER BECOMES RUBBER COMPOUNDER.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR:—At present I am employed in the chemical department of a rubber factory in this city and am desirous of becoming thoroughly familiar with general compounding for the rubber trade. If there are any books I can procure on compounding I would be much obliged for the names of them. I might say I have had only a few months at the compounding end of the game, having taken it up on being discharged from the Canadian Army as unfit for further service through wounds. I spent twenty-two months in France, and had the pleasure of teaching some of the boys from the U. S. A. the system as used in the Allied Armies. I was a first lieutenant.

Very truly yours,

C. H. STANYON.

Toronto, Canada.

AUTOMOBILE SHOWS CANCELED.

The national automobile shows to have been held in New York and Chicago have been canceled at the request of the War Industries Board and promoters throughout the country have been asked to abandon all plans for local shows of automobiles, trucks, or accessories.

Become a stockholder in the United States—buy War Savings Stamps.

New Goods and Specialties.

THE "TRI-CO" RAIN RUBBER.

A RUBBER or wiper for wind shields, which attaches to the lower edge of the upper glass, cleans both upper and lower portions of the shield simultaneously. It slides across easily by means of a slot provided for the purpose and may be operated by either the driver or passenger in the automobile.

The Umbrella for Windshields

Each arm of the rubber is provided with multiple gum rubber cleaning surfaces which remove rain or snow and at the same time dry the glass on the principle of the squeegee. This is usually the case in windshield cleaners of this type, and for this reason many of these devices have a similar appearance at first glance.

Some point of diversity, however, entitles their inventors to a patent. (Tri-Continental Corp., Sidway Building, Buffalo, N. Y.)

FAIRFIELD RUG ANCHOR.

You may now safely decorate your highly polished hard-wood floors with the most slippery of antique rugs you can afford, yet with the long-wished-for assurance that you may step on them as nonchalantly as you please without danger. A new fabric called rug anchor, made of rubber-faced whipcord, is laid under the rug with the rubber-coated surface forming a non-skid one against the floor. Du Pont Fabrikoid Co., Inc., successor to Fairfield Rubber Co., Wilmington, Delaware.

A NOVEL HEEL DESIGN.

A new design for a rubber heel shows a conventionalized pattern with notched-in outer edge and the center portion form by a star having seven points of uneven length and the center cut out. This design has recently been patented. (Gustav A. Huben, 2219 Fremont street, Chicago, Illinois.)

SYPHON BATH OUTFIT FOR THE SOLDIER.

In addition to the rubber boots and coats, hand basins and drinking cups, inflatable pillows and mattresses, etc., now comes the portable syphon-bath outfit for the soldier, with the same convenient fittings to which he was accustomed at home, but compactly arranged in a folding khaki case provided with pockets and straps to hold all the different parts securely in small space. The case is sold packed in a neat carton. (Knickerbocker Manufacturing Co., 206-216 West Sigel street, Chicago, Illinois.)

AN EAR STOPPLE FOR SWIMMERS.

A device to protect the ears of swimmers and bathers, divers, and marine divers from being flooded with water or irritated by particles of sand or other foreign substances, is shown in the accompanying illustrations. The smaller one illustrates the ear stopple itself and the larger gives an idea of how the stopple

looks in position in the ear. These ear stopples have no opening, yet permit the wearer to hear almost normally.

For other purposes, however, such as gunning and hunting, cycle racing, riveting and boiler-making, etc., another style called the perforated ear stopple, is recommended. Both designs are made of soft, flesh-colored rubber and are almost unnoticeable when in position. They are easily removed from the ears when desired, and weigh very little. (Dr. Frank Ear Stopples Co., 325 Locust street, Toledo, Ohio.)

FOR THE SOLDIER'S PROTECTION AND COMFORT.

For the protection of the soldier against rain and storm there are many types of garments and one of the practical ones is the military cape. That in the accompanying illustration is made in four styles of double-texture tan or olive-drab fabric in different qualities and weights, coated with tan, olive-drab, or black rubber, with sewed, cemented, and strapped seams. One style is reversible, and all are provided with large arm slits and ball-and-socket fasteners. These capes are 52 inches long and are

made to fit small, medium, and large-sized men.

The mattress above, known as the "Handy Camp Mattress," is covered with khaki cloth and is fitted with the "staytite" valve. It is strong, flexible, and easily adjusted according to the degree to which it is inflated. When not in use, the mattress can be rolled up into a small, compact bundle which is easily carried. (Hodgman Rubber Co., Tuckahoe, New York.)

UTILITY SURE-GRIP PEDALS.

A new style of pedal for use on Ford cars is called the "Utility Sure-Grip." It is faced with a good quality of rubber and is wide enough so that the foot does not readily slip from position. These pedals are also differentiated in shape so that there is a marked contrast between that for the reverse and those for the clutch and brake on either side. A nut holds each pedal in place. The material used is pressed steel with a non-rusting metal edge around the rubber facing. (The Hill Pump Valve Co., Archer avenue at Canal street, Chicago, Illinois.)

THE "FITSAL" FAUCET CONNECTOR.

A faucet connector which is provided interiorly with three grooves of varying diameter is known as the "Fitsal" because it fits faucets of one-quarter, five-eighths, or three-quarters-inch diameter (equivalent to three-eighths, one-half, or five-eighths-inch thread), as well as three-eighths and one-half-inch diameter standard tubing. This convenient connector is made of high-grade para rubber and is easily adjusted, as it needs no stretching. It is especially suited to use with bath sprays and portable showers. A chain is provided for looping over the faucet to guard against the attachment being blown off by water pressure. (The Bunker Hill Rubber Works, Bunker Hill, Illinois.)

BULL'S EYE "RUB-R-SEALED" PATCH.

A patented patch for mending inner tubes is made of "Rub-R-Sealed" elastic fabric composed of cotton elastic webbing rubber-faced on both sides, one being fine Para rubber and the other, inner-tube stock. The unvulcanized

patches are cloth-wrapped on and around a metal core and the cloth-wound ones are open-steam-vulcanized, producing a curved effect. (Bull's Eye Rubber Co., Inc., 131 Harris avenue, Long Island City, New York.)

THE "DREADNAUGHT" SAFETY SUIT.

The practice of conservation affects greatly differing lines of products, one of the latest of which is the safety suit of rubberized fabric. Our issue of November 1, 1915, described the Youngren life-saving suit, later called the "Ever-Warm." This included a large rubber-covered metal framework at the top, which was heavy and clumsy. The conservation of metal by the Government, to cite only one reason, led to the invention of an improved life-saving suit along similar lines, called the "Dreadnaught." The new suit does away with the metal frame and mittened hands. It is provided with an opening at the neck, by which it is put on, which closes by being folded over on itself watertightly and held in place with buckled straps. The sleeves end in elastic-fabric wrists which make them water-tight and leave the hands of the wearer free to operate wireless or do anything else desired. The feet are weighted to maintain the wearer in an upright position and the suit obtains its buoyancy from the kapok with which it is padded. An outside pocket holds food, etc. (Life-Preserver Suit Co., 1385 Broadway, New York City.)

NEW ENGLISH SOLE.

Owing to the scarcity of leather in England, a great variety of rubber or fiber-and-rubber soles have been produced. One of the latest is composed of a canvas backing having secured to it a rubber tip *b* and undercut or grooved ribs *c*, with a filling *d* of rubber substitute secured in place by vulcanization. The drawing shows how this sole-protector, which it really is, looks.

It is said to be popular, as it does not slip, and it is fairly cheap. This sole is patented in The United Kingdom. (F. J. Wood, 3 Raws street, Bank Parade, Burnley, Lancashire, England.)

THE "NO-THUMP" TUMBLER WASHER.

A patented device in general use at soda fountains which prevents the nicking and breaking of soda glasses during the washing process and which at the same time provides for adequate cleansing and sterilizing, is embodied in the "No-Trump" tumbler washer shown herewith. The bottom part of metal is provided with three pieces of rubber tubing which are replaceable and are held in position by means of little projections from the framework, so that no metal runs through the rubber tubing to make it unyielding when the glasses hit it. Other features of this practical piece of soda-fountain equipment provide for the washing of the inside and outside of the glass simultaneously with either hot or cold water or water to which a sterilizer has been added. The hand of the person holding the glass touches the bottom only, the glass

being bottom upward. (L. L. Rowe, 74 Portland street, Boston, Massachusetts.)

SUBMARINE "R 2."

Among the latest war toys is a submarine which can be made to run submerged or on the surface of the water, straight ahead, or in circles. It will also dive, rise to the surface, and simultaneously shoot a projectile. All this is accomplished by adjustment of the vanes and rudders. This submarine is fifteen inches long. The hull is of wood, painted battleship-gray, and the operating parts are of brass, galvanized steel, and rubber. (The Wilkins Toy Co., Keene, New Hampshire.)

FOWL-DISINFECTING AND EXERCISING APPARATUS.

A novel use for the rubber bulb has been found in an ingenious device, not without its amusing features, for automatically spraying fowls with powdered or liquid disinfectant. When a fowl leaps upon the perch of the apparatus to reach the cabbage suspended by a cord over a pulley on the support above, the weight of the fowl moves the inclined hollow lever downward, compressing a large rubber bulb at the bottom with sufficient power to blow air through the lever and force the disinfectant from the reservoir of the nozzle onto the fowl, as indicated. As the lever moves downward, the food is drawn out of reach, so that each fowl gets only a single mouthful at each flight. The fowl soon leaves the perch, the lever being returned to its normal position by means of a re-

silient spring. Many fowls are thus induced to take exercise and submit to disinfection in their attempts to get the food. (David B. Bird, 7351 Coles avenue, Chicago, Illinois.)

News of the American Rubber Industry.

PENNSYLVANIA RUBBER CO. ANNUAL CONFERENCE.

THE annual conference of sales directors and branch managers of the Pennsylvania Rubber Co., Jeanette, Pennsylvania, was held at the factory of the company from September 18 to 21, the business sessions taking place, however, at the Wayfarers Club—the Pennsylvania Rubber Company Club, next to the factory. The meetings were conducted by H. W. DuPuy, president, and Seneca G. Lewis, general manager, while messages were read from the vice-president, Major C. M. DuPuy, and other members of the company now serving the Government. The artistic little booklet giving the program had as a center-spread a miniature service flag printed in the proper colors, bearing six stars, and under each appeared the name of the man it represented.

THE CUTLER-HAMMER COMPANY IN WASHINGTON.

The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, manufacturing electric-controlling devices and similar apparatus, opened on September 3, 1918, a branch office in the Union Trust Building, 15th and H streets, N. W., Washington, District of Columbia, in charge of H. W. Knowles and C. W. Yerger, engineers who are quite familiar with the company's products. This office will be operated entirely for the purpose of serving the Government and others who require information about the company's goods, orders, contracts, etc.

ASHLEY PLANT SUFFERS FIRE LOSS.

On the morning of September 26 the plant of T. C. Ashley & Co., manufacturers of chemicals and rubber substitutes, in the Brighton district of this city, was almost entirely destroyed by fire, with a loss variously estimated from \$15,000 to \$20,000.

It may be remembered that T. C. Ashley & Co.'s plant at South Boston was burned a year ago, and the firm moved from that location to Brighton.

GOODRICH NOTES.

The B. F. Goodrich Co., Akron, Ohio, is calling for 1,000 new women war workers in its gas-mask and balloon department. It assures good wages, daylight shifts, and wholesome factory conditions.

The list of former employees of The B. F. Goodrich Co. now in service numbers 3,356.

"The Goodrich Circle" printed in its September number a notice to employees in four languages besides English, advising American and foreign employees alike how to conduct themselves at work, urging them to guard against arguments, fire, waste, excessive indulgence in alcoholic drinks, and laziness, as well as the showing of consideration to foreigners—all in the interest of maximum production of what the country needs.

The B. F. Goodrich Co. started on September 9 a special class in citizenship, under the direct supervision of Dr. Oscar Junek. Foreign-born employees previously classed as enemy aliens, but who had taken out their first papers at least two years prior to the declaration of war on Germany by the United States were declared eligible for membership and to apply for final papers.

Following its policy of re-employing soldiers who return disabled by the war, The B. F. Goodrich Co. now has back in its tire-finishing department Jean Joseph Roignant, who has a limp, a Médaille Militaire, and a Croix de Guerre. He pays a high tribute to Americans in the war—"They fight like the French," he says, "to the death, and what they take they hold."

DIVIDENDS.

The American Chicco Co., New York City, declared its regular quarterly dividend of one and one-half per cent on its preferred stock, payable October 1 on stock of record September 20, 1918.

The Apsley Rubber Co., Hudson, Massachusetts, has declared its semi-annual dividend of three and one-half per cent on its common stock, payable October 1 to stock of record September 30, 1918.

The Canadian General Electric Co., Limited, Toronto, Ontario, Canada, has declared its regular quarterly dividend of two per cent on its common stock, payable October 1 to stock of record September 14, 1918.

E. I. du Pont de Nemours & Co., Wilmington, Delaware, declared the regular quarterly dividend of four and one-half per cent on the common stock, payable September 16 to stock of record August 31; also the regular quarterly dividend of one and one-half per cent on the debenture stock, payable October 25 to stock of record October 10, 1918.

The Hawkeye Tire and Rubber Co., Des Moines, Iowa, declared on August 1, the semi-annual dividend on its preferred stock and on August 19, a dividend of six per cent on its common stock, payable October 15, 1918.

The Kelly-Springfield Tire Co., New York City, has declared its quarterly dividend of \$1.50 per share on its six per cent preferred stock, payable October 1 to stock of record September 16, 1918.

The Keystone Tire and Rubber Co., New York City, has declared its quarterly dividend of two per cent and an additional one-third of one per cent on its preferred stock and its regular quarterly dividend of three per cent on its common stock, payable October 1 to stock of record September 20, 1918.

The Portage Rubber Co., Barborton, Ohio, has declared its regular quarterly dividends of three per cent and one and three-quarters per cent, respectively, on its common and preferred stock, the former payable November 15 on stock of record November 5, 1918, and the latter payable January 1, 1919, on stock of record December 20, 1918.

The Republic Rubber Co., Youngstown, Ohio, declared its quarterly dividend of one and three-quarters per cent on its preferred stock, payable September 1 to stock of record August 20, 1918.

The Sewell Cushion Wheel Co., Detroit, Michigan, recently declared a seven per cent cash dividend on both common and preferred stock.

TILLINGHAST COMPANY INCORPORATES.

The business of the late B. C. Tillinghast at 236 Market street, Philadelphia, Pennsylvania, has been incorporated as the B. C. Tillinghast Rubber Co. Inc., with capital of \$75,000 and the following officers: A. W. Tillinghast, president; J. H. Carr, vice-president and general manager; F. F. Crippen, secretary and treasurer. Besides these, the incorporators include Mrs. L. W. Tillinghast, James H. Beith, and Charles Hess, Jr.

The company was incorporated in accordance with the wish of Mr. B. C. Tillinghast, as expressed in his will, and the incorporators include his widow and son and the employees of the concern, of whom the latter have been in service for periods ranging from 22 to 38 years. These are to have the privilege of purchasing stock in the new company. Messrs. Carr, Beith, and Hess will continue to travel for the concern, in addition to their other duties. The company manufactures all kinds of rubber goods, including "Imperial" tires and tubes, clothing and footwear, mechanical rubber goods, and rubber toys.

CHARLES A. RICE.

THREE years ago the city of Youngstown, Ohio, suffered from a flood which put the municipal water supply service out of commission, the needs of the city for both fire protection and general use being

CHARLES A. RICE.

supplied, in the emergency, by connecting the independent system of The Republic Rubber Co. with the city water mains until the subsidence of the flood allowed the pumping station to resume operations.

The history of this water supply is interesting four years ago The Republic Rubber Co. found it necessary to secure an independent water supply.

Sufficient pressure and volume were available, but the water was too warm and its mineral action was destructive to boilers, pumps, etc.

The problem was solved by Charles A. Rice, who was then, as now, in charge of the mechanical and electrical equipment of the plant. Two miles from the factory, in the hills, was an abandoned coal mine, at the bottom of which was a lake of clear, cold water. Mr. Rice devised a system of syphonage and pumping by which the water, brought to the surface, forms a brook for nearly half a mile, and then enters a 10-inch pipe, through which, by gravity, it supplies the factory constantly with pure spring water.

During his 15 years with the company, Mr. Rice has made many other important mechanical improvements at the plant, including the equipment of individual motor drives in the calender room, the installation of low-pressure turbines superseding high-pressure reciprocating engines, and the addition of coal and ash-handling equipments, centrifugal pumping machinery and other up-to-date improvements.

Mr. Rice was born in Deerfield, Ohio, in 1875, and supplemented a common-school education by a course in electrical engineering. In 1899 he became engineer in a flour mill, and two years later for a short time was in the electrical department of the Carnegie Steel Co. at the Ohio works; thence going to The Republic Rubber Co. as assistant electrician, becoming chief electrician in 1906, and in 1912 being given full charge of all mechanical and electrical equipment.

He is a member of the American Institute of Electrical Engineers, and of all the Masonic bodies, up to and including the thirty-second degree. His home is at Youngstown, Ohio.

NEW OFFICERS OF BOONE TIRE & RUBBER CO.

The Boone Tire & Rubber Co., Chippewa Falls, Wisconsin, at its annual meeting elected the following officers and directors for the ensuing year: I. V. Maclean, president; F. W. Edgell, vice-president; Holmes Ives, secretary; and J. M. Andrejeski, treasurer; directors—all the above and J. C. Clink, C. B. Culver, Charles F. Oashgar, W. W. Shong, and W. J. Fulton.

PERSONAL MENTION.

James K. Beach has been appointed supervisor of the Texas territory of the Ajax Rubber Co., Inc., New York City, and will have his headquarters at Dallas. He was previously the company's California supervisor, with headquarters in San Francisco. He succeeds H. C. Burnett who has entered government service.

J. B. Bleiler has been appointed special representative of the truck tire division of The Republic Rubber Corp., Youngstown, Ohio, with headquarters at 1745 Euclid avenue, Cleveland, Ohio.

George M. Hoffman holds a record of 15 years' service as manager for The Republic Rubber Co., Youngstown, Ohio, at its branch at 2020 Locust street, St. Louis, Missouri.

L. N. Bartlett has been appointed assistant manager for The Republic Rubber Co., Youngstown, Ohio, at its branch at St. Louis, Missouri.

H. D. Chipley is manager for the United States Tire Co., New York City, at its branch at 1311 East Main street, Richmond, Virginia, to which address it has recently removed. This branch is in the Philadelphia district of the company.

Ernest L. Patten, Malden, Massachusetts, has been granted a patent on his sole-cutting machine described in **THE INDIA RUBBER WORLD** of August 1, 1918.

Prescott C. Ritchie has succeeded H. S. Johnson, who recently resigned, as western district representative for the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, with headquarters at Indianapolis, Indiana. He was formerly in charge of headquarters inquiry work for the same company in its western district and main offices. Previous to that he was connected with the Thomas B. Jeffrey Co., Kenosha, Wisconsin.

William E. Barker, for some years manager of shoe sales of the United States Rubber Co., but who resigned from that position last summer, and later made a tour of inspection of the company's *Hevea* plantations in Sumatra, has been appointed general sales manager of the wire division of the National India Rubber Co., Bristol, Rhode Island, a subsidiary of the United States Rubber Co.

J. R. Hall, president of J. R. Hall & Co. and vice-president of the First National Bank of Flemington, New Jersey, has succeeded G. Frank Gingles, resigned, as secretary of the Dural Rubber Corp. of that town.

H. M. Murdock formerly manager of the branch of the United States Tire Co. at Amarillo, Texas, has succeeded Frank Kathman as manager of the company's branch at 224 North Sixth avenue, Quincy, Illinois.

A. M. Hill has been appointed sales manager of The Fisk Co. of Texas, San Antonio, Texas.

G. H. Carnahan, of the International Rubber Co., West Barington, Rhode Island, has been appointed vice-president of The Bayer Co., Inc., manufacturer of aniline colors and pharmaceutical products by the Alien Property Custodian, who recently took over The Bayer Co., and will sell its capital stock to American citizens as soon as the books have been audited and the property appraised.

Stuart Webster, formerly treasurer of the Racine Rubber Co., Racine, Wisconsin and vice-president of the Ajax Rubber Co., Inc., has come East from Racine to act as treasurer of the Ajax company in New York City. He succeeds Harold Stimpson, who has resigned to enter government service.

Dr. E. A. Wullenweber has signed a contract for a term of years as chief chemist for The Mid-Continent Tire Manufacturing Co., Wichita, Kansas.

Miss Hazel McCarthy succeeds Miss Frances E. Silbaugh as nurse in charge of the first aid department at The Federal Rubber Co., Cudahy, Wisconsin, Miss Silbaugh being with the Red Cross in France.

TRADE NOTES.

The United States Rubber Co., New York City, announces that the net earnings of the company for the six months ended June 30, 1918, amounted to \$10,242,365.46 after deducting all interest charges and allowing for depreciation, federal taxes, and reserves.

The Pennsylvania Rubber Co., Jeannette, Pennsylvania, at its recent annual meeting elected the following officers: H. W. DuPuy, president (reelected); Charles M. DuPuy, vice-president; Seneca G. Lewis, general manager; and G. W. Shively, secretary.

The Burdick Tire & Rubber Co., 220 South State street, Chicago, Illinois, announces its removal to Noblesville, Indiana, where all mail should be addressed. Plans of this company for the building of a factory and other operations in Noblesville were mentioned in our issue of March 1, 1918.

The Zwebell Brothers Co., Milwaukee, Wisconsin, which has been engaged in the motor car sales and repair business for some years, has recently developed an improved method of dry cure retreading and will begin the manufacture of a mold for re-treading tires. The company has incorporated at \$25,000 for this purpose.

The Neilson Rubber Co., 533 South Ervay street, Dallas, Texas, distributor of "Quaker" tires, is adding a two-story, 35-foot addition to its present building to take care of its increasing business. S. P. Neilson is manager of the company.

The Life Preserver Suit Co., Inc., has removed its offices from 11 to 1358 Broadway. It is now putting on the market a new improved life-saving suit made of rubberized fabric, described on another page of this issue.

The American Mineral Co., Johnson, Vermont, mining and milling talc, has completed installation of motors at its mill and is now operating with hydro-electric power supplied from the village of Morrisville over an eight-mile transmission line built especially for it. It uses approximately 225 horse-power twenty-two hours daily. It plans to extend this equipment to its mines, also.

The Whitestone Tire & Rubber Co., Inc., 1215 Fourth avenue, Seattle, Washington, has undertaken the distribution of Mason tires and tubes for that state. Maurice Kline is president of the concern.

The Motor Equipment Co. of America has changed its name to the Wheel and Rim Works Corp. The office of the corporation is with the United States Corporation Co., 311 South State street, Dover, Delaware.

The Southland Tire & Rubber Co., Fort Worth, Texas, is completing its new factory, which is of fireproof construction, 80 by 300 feet, four stories high. Modern machinery and equipment has been purchased and most of it delivered ready for installation. In the meantime the company is turning out its product in another plant on its own cores, molds, etc., under the supervision of its superintendent of production. The officers of the company are: William Ginnuth, president; J. C. Vernor, vice-president; and C. M. Zeigle, secretary. W. H. Vernor is the fiscal agent of the concern.

The Cleveland Tire & Rubber Co., formerly at 309 North 15th street, Philadelphia, Pennsylvania, has removed to 685 North Broad street and changed its name to the Gillette Tire Co. of Philadelphia. J. W. Paul is general manager.

The Lion Tire & Rubber Corp., Inc., East Union street, La Fayette, Indiana, has appointed as its distributor in parts of the state, the Lion Supply Co., corner of Fifth and Columbia streets.

The Eagle-Picher Lead Co., manufacturer of red lead, litharge, and orange mineral, 208 South La Salle street, Chicago, Illinois, celebrated September 19 as Flag Day, raising service flags at its different plants, showing 650 former employees in service.

The Firestone Tire & Rubber Co., at its August meeting,

adopted a resolution providing for insurance of all workers who have been in the employ of the company for more than thirty days. The amount increases for each year of service up to the fifth year, when the maximum of \$1,000 is reached.

Employees of The Goodyear Tire & Rubber Co. and their friends to the number of 50,000, attended the third annual field meet and family picnic at the company's forty-acre athletic field, Seiberling Park, on Labor Day. Over 500 employees took part in the various contests, and a community sing and dancing followed the athletic events at the end of the day.

The Amazon Rubber Co., Akron, Ohio, has purchased the tire accessory business of the O'Neil Tire & Rubber Co., including the exclusive right to the name "O'Neil," the good-will of the trade, and all unfilled orders on hand. It will put out reliners, wing blowout patches, lace-on boots, cementless patches, etc., under the name "O'Neil Pioneer Accessories."

TAUNTON RUBBER CO. ELECTS OFFICERS.

The Taunton Rubber Co., Taunton, Massachusetts, at a stockholders' meeting held September 13, 1918, elected the following officers who are also directors: William L. Gifford, president; Joseph L. Gifford, clerk and treasurer; Charles S. McCall, Henry G. Crapo, and Warren Swift. Joseph L. Gifford, who has recently acquired a controlling interest in the company, retains the management of the company which he has had in charge for the last four years and there will be no radical changes in the business affairs of the company.

QUABAUG RUBBER CO. ELECTRIFIES PLANT.

The Quabaug Rubber Co., North Brookfield, Massachusetts, is installing electrical equipment for motive power which is to be supplied by the Central Massachusetts Electric Co. at 22,000 volts, amounting to about 700 electric horse-power. When this installation is completed, steam will be used only for heating purposes and the vulcanization of rubber goods.

TRAVELER TIRE AND RUBBER CO. TO BUILD.

The Traveler Tire and Rubber Co., Traveler Building, Philadelphia, Pennsylvania, has acquired title to three acres of ground on the Pennsylvania & Reading railroad, between Hellertown and Bethlehem, for the purpose of erecting a factory for the manufacture of automobile tires. The officers of the company are as follows: Guy de la Rigaudiere, president; Victor Durand, Jr., first vice-president; G. J. P. Raub, second vice-president; E. E. Pollard, secretary and treasurer. The board of directors includes the above and Latimer R. Baker, Henry L. Renard, Martin H. Fritz, and Joseph Reich.

CANADIAN NOTES.

THE Canadian National Exhibition has opened in Toronto under most favorable conditions. Some twenty-five or thirty new features have been added this year for the comfort and entertainment of exhibitors and visitors.

Gutta Percha & Rubber, Limited, has an exhibit of tires in the Transportation Building, and a showing of miscellaneous products in the Process Building. An immense rubber belt is included, and the display of tennis and other sport shoes and "Tenax" soles is no small feature.

The Canadian Consolidated Rubber Co., Limited, has an extensive exhibit in the Process Building. Before a handsome background depicting a rubber plantation, every process of manufacture is shown from crude rubber to the finished products. Rubber soles and heels, sport shoes, and rubbers are featured strongly as well as new things in rubber-soled pumps, slippers, etc.

NEW INCORPORATIONS.

Cooper Rubber Co., July 29 (Tennessee), \$40,000. I. J. Cooper, J. W. Brumbaugh, R. D. Bond, H. H. Brenner and E. Wilkins. Principal office, Knoxville, Tennessee. To buy, sell, manufacture or otherwise deal in automobiles, bicycles, motor trucks, tractors, etc.

Dace Rim Corp., August 30 (New York), \$50,000. E. T. Burney, 3089 Broadway; E. E. Fish, 220 West 107th street; H. B. Wood, 102 West 75th street, all of New York City. To manufacture rims, tires, auto parts, etc.

Dilator Syringe Corp., August 24 (New York), \$50,000. C. Marks, 327 East 60th street; H. Cohen, 1259 College avenue; H. McCormick, 57 West 130th street—all of New York City. To manufacture syringes, etc.

Grand-Gravois Automobile Co., February 13 (Missouri), \$15,000. A. J. Dietrich, 3815 Michigan avenue; T. J. Mueller, 3408 Miami street; E. L. DeWinter, 3618 Bamberger avenue—all of St. Louis, Missouri. Principal office, 3664 Gravois avenue, St. Louis, Missouri. To deal in automobile supplies, solid, pneumatic, and cushion tires, and do automobile and truck repairing.

Great Lakes Rubber Co., April 18 (Wisconsin), \$100,000. D. C. Barbee, C. J. Zaiser and H. O. Wolfe. Principal office, Milwaukee, Wisconsin. To manufacture rubber goods of all descriptions.

Gudgell's Rubber Hub Co., The, August 17 (Illinois), \$140,000. L. Gudgell, L. Paridor and H. Hankins. To manufacture and deal in "Gudgell's Rubber Hub."

Hercules Rubber Co., Ltd., March 11 (Ontario, Canada), \$150,000. J. A. Campbell, A. Brown, H. W. Dawson, J. McMurchy, T. Thaburn. Principal office, Main street, Brampton, Ontario, Canada. To manufacture and deal in all kinds of rubber goods.

Iowa National Rubber Co., August 17 (Delaware), \$50,000. E. E. Erb, E. M. Jauss, M. C. Miller—all of Harrisburg, Pennsylvania. Delaware agent, Delaware Registration Trust Co., 900 Market street, Wilmington, Delaware. To buy, sell and deal in crude or manufactured rubber, gutta percha, etc.

J. & D. Tire Co. of New York, September 6 (New York), \$50,000. F. McAllister, T. G. Patterson, both of 1761 Broadway, W. J. McAllister, 165 Broadway—all of New York City. To manufacture tires, etc.

Krebs Mining Co., June 15 (Delaware), \$100,000. H. J. Krebs, A. S. Krebs, both of Wilmington, H. V. Berg, Newport—all of Delaware. To purchase, lease or otherwise acquire any mines, mining rights, and mineral lands and to develop the same.

Maryland National Rubber Co., August 17 (Delaware), \$50,000. E. E. Erb, E. M. Jauss, M. C. Miller—all of Harrisburg, Pennsylvania. Delaware agent, Delaware Registration Trust Co., 900 Market street, Wilmington, Delaware. To buy, sell, and deal in crude or manufactured rubber, gutta percha, etc.

Morris Tire Machinery Co., The, August 6 (California), \$57,600. E. H. Furman, Grant Road, Mountain View; E. Wengler, 3736 20th street, San Francisco; H. Laughlin, 5028 Webster street, Oakland—all in California. Principal office, Los Angeles, California. To deal in rubber goods.

New York National Rubber Co., August 17 (Delaware), \$50,000. E. E. Erb, E. M. Jauss, M. C. Miller—all of Harrisburg, Pennsylvania. Delaware agent, Delaware Registration Trust Co., 900 Market street, Wilmington, Delaware. To buy, sell, and deal in crude or manufactured rubber, gutta percha, etc.

Ohio National Rubber Co., August 17 (Delaware), \$50,000. E. E. Erb, E. M. Jauss, M. C. Miller—all of Harrisburg, Pennsylvania. Delaware agent, Delaware Registration Trust Co., 900 Market street, Wilmington, Delaware. To buy, sell, and deal in crude or manufactured rubber, gutta percha, etc.

Pan-American Rubber Co. of New Jersey, The, August 23

(New Jersey), \$20,000. F. Christmann, A. F. Bottcher, F. Coelln—all of Paterson, New Jersey. Principal office, 91 Prospect street, Paterson, New Jersey; agent in charge, F. Christmann. To make, purchase, and sell rubber goods and all goods of which rubber is a component part.

Pennsylvania National Rubber Co., September 17 (Delaware), \$50,000. E. E. Erb, E. M. Jauss, M. C. Miller—all of Harrisburg, Pennsylvania. Delaware agent, Delaware Registration Trust Co., 900 Market street, Wilmington, Delaware. To buy, sell and deal in crude or manufactured rubber, gutta percha, etc.

Pyramid Manufacturing Co., August 21 (Maine), \$100,000. M. F. Hearin, R. W. Farris, C. L. Andrews—all of Augusta, Maine. To deal in waterproofing materials and other kinds of merchandise.

Roamer Tire & Rubber Co. of Akron, Inc., The, August 29 (New York), \$40,000. G. E. Rohmer, 726 Ocean avenue, Brooklyn; A. D. Paillot, 157 Queens building, Woodside; W. F. Timme, 593 Riverside Drive, New York City—all in New York. To manufacture and deal in tires and rubber goods.

Rubber Products & Supply Co., August 10 (Kansas), \$10,000. W. G. Barbour, B. A. Helfrick, P. Deam, E. Blake, F. Purnell and F. C. Dymock—all of Wichita, Kansas. Principal office, Wichita, Kansas. To transact a general mercantile, jobbing and manufacturing business in rubber goods, automobile tires, tubes and accessories.

Tillinghast Rubber Co., Inc., B. C., August 23 (Pennsylvania), \$75,000. L. W. Tillinghast, A. W. Tillinghast, J. K. Carr, J. H. Beith, C. Hess, Jr., and R. F. Crippen. Principal office, 236 Market street, Philadelphia, Pennsylvania. To manufacture tires and tubes, rubber clothing and footwear, mechanical rubber goods, and toys.

West Virginia National Rubber Co., August 17 (Delaware), \$50,000. E. E. Erb, E. M. Jauss, M. C. Miller—all of Harrisburg, Pennsylvania. Principal office with the Delaware Registration Trust Co., 900 Market street, Wilmington, Delaware. To buy, produce, sell, trade and deal in any and all kinds of crude and manufactured rubber, etc.

Wheel and Rim Works Corp., August 30 (Delaware), \$600,000. S. B. Howard, G. V. Reilly, A. W. Britton—all of 28 Nassau street, New York City. Principal office with the United States Corp. Co., 311 South State street, Dover, Delaware. To manufacture and deal in automatic signal horns, carpet sweepers, aeroplanes, tractors, automobiles, etc.

Zwebell Brothers Co., July 23 (Wisconsin), \$15,000. H. A., A. B. and A. R. Zwebell. Principal office, Milwaukee, Wisconsin. To manufacture a machine to repair automobile tires, known as the Zwebell retreading machine, and molds.

CLAIMS AGAINST BATAVIA AND SIMPLEX RUBBER COS.

A notice to creditors of The Batavia Rubber Co. and The Simplex Rubber Co. of America, Inc., Batavia, New York, which some time ago went into the hands of a receiver, states that in order to be considered, all claimants must file duly verified claims against either or both of these concerns on or before October 7, 1918, with Maxwell H. Bochow, receiver, at the office of his solicitors, Brexel, Abbott & Morgan, 32 Liberty street, New York City.

RUBBER CHEMIST WINS PROMOTION.

The recent promotion of Charles P. Flora to the position of state superintendent of the Hood Rubber Co., East Watertown, Massachusetts, is his reward for intensive application along one unbroken line of endeavor for over thirteen years. Mr. Flora began his career with this concern as a chemist in 1905, later being appointed master of refining. In 1912 he became master of reclaiming and has also held the position of chemical engineer of the concern. He is a Yale graduate and enjoys great popularity throughout the Hood organization.

CLARENCE J. WELCH.

BECAUSE of the announcement that Clarence J. Welch, manager of the motor-truck tire department of the United States Tire Co., has been advanced to the position of assistant sales

CLARENCE J. WELCH.

manager, that gentleman is receiving the congratulations of his host of friends in all parts of the country. The promotion is fully earned and deserved, for Mr. Welch has had a practical and commercial experience extending over a decade with the company and its predecessors.

Born in Kalamazoo, Michigan, in 1887, he was educated in the public schools of that city, the Le Fevre Institute, and the University of Notre Dame, Indiana, graduat-

ing from the latter in 1905. After some time with a regalia manufacturing concern, and four months in a piano factory, he went to Detroit as salesman for the Cable Piano Co. This, however, not suiting him, he entered the employ of Morgan & Wright, September 1, 1907, and spent a year in the factory, another in the sales department, learning the tire business from the bottom. In 1909 he was made assistant manager of the bicycle and motorcycle departments of that company, and when the concern was made a part of the United States Tire Co. in 1911, he went to Chicago, Illinois, as assistant to J. C. Weston, who, as central district manager for the new company, was in charge of its business in twenty-two central states. At that time Mr. Welch had charge of the bicycle, motorcycle and truck tire sales. He made such phenomenal sales records in these departments that in 1913 he was transferred to the general offices of the company in New York City and given general charge of the motor-truck tire department. His success in that field has led to his recent promotion. His new position opens up a much wider field of responsibility and opportunity.

Mr. Welch is a member of the Society of Automotive Engineers, The Motor Truck Club of America, and the Wykagyl Country Club of New Rochelle, New York, in which suburb of New York City he has his residence.

STERLING TIRE CORP. BRANCH MANAGERS.

The Sterling Tire Corp., Rutherford, New Jersey, announces the following appointments: W. C. Clark, formerly connected with the company's branch at Rochester, New York, now manager at Bridgeport, Connecticut, succeeding W. M. Cowles who has resigned because of poor health; George Buckridge now manager of the company's sales branch at Albany, New York; Howard Lacey, formerly detailed on special sales work in New York, now manager of the company's branch at Hartford, Connecticut; J. P. Stiles, formerly a salesman at the company's branch at Newark, New Jersey, now manager of its branch at Providence, Rhode Island.

PURCHASING AGENTS ADOPT A STANDARD CATALOG SIZE.

The National Association of Purchasing Agents, acting on the consensus of opinion of twenty-four associations, representing various industries, professions and trades, urges that all catalogs meant for purchasing agents be made $7\frac{1}{2}$ by 10 $\frac{1}{2}$ inches, or, in the case of small booklets of the half sizes, if saddle stitched, one-half this size so that they will open up to the full size for filing.

Not only will this standardization facilitate buying, because catalogs can be filed according to classes of material rather than size, but it is claimed that it will result in saving millions of dollars annually in the printing business and will release for other work 30,000 employees formerly employed on hand-fed presses.

DRIVER-HARRIS IN CANADA.

The Driver-Harris Co., Harrison, New Jersey, has incorporated in Canada as the Canadian Driver-Harris Co., Limited, at Walkerville, Ontario, the date of incorporation being June 6, 1918. At present it will manufacture nichrome castings and does not contemplate the making of rubber-insulated wire. The officers are: Frank L. Driver, president; Arlington Benschel, first vice-president; Leon O. Hart, second vice-president; Leroy Edwards, secretary and treasurer.

RUBBER MANUFACTURERS RED CROSS AUXILIARY.

Managers of the various rubber companies represented in Fargo, North Dakota, by wholesale factory branches recently had a dinner at the Gardner for the purpose of discussing the formation of an auxiliary to the local Red Cross, to be known as the Rubber Manufacturers Red Cross Auxiliary, and composed of the various branch employees numbering about fifty. Arrangements for such an organization are now being completed. Those present at the dinner were: C. J. Burns, Ajax Rubber Co., Inc.; A. T. Severs, Firestone Tire & Rubber Co.; R. M. Hakens, her Co.; C. A. Moshier, The Goodyear Tire & Rubber Co.; J. P. The Fisk Rubber Co.; C. A. Williams, The B. F. Goodrich Rubber Chambers, Marshall-Racine Rubber Co.; and D. B. Murdock, United States Tire Co.

RUBBER COMPANY TRUCKS HELPING THE RAILROADS.

Completion of a census by The B. F. Goodrich Co., Akron, Ohio, of the volume of motor truck transport on the Cleveland-Akron highway discloses the dramatic story that the relief to the railroad lines between these important centers is 1170 per cent over nine months previous. In car figures, this means that this 40-mile highway is giving 885 freight cars a week to other communities for more vital tonnage. If only an average of 600 car-releases a week is maintained for twelve months, this busy roadway will have saved for the nation 31,200 freight cars.

These statistics tell more vividly than all phrases how potential is the aid being given the hard-pressed railroad systems of the country. They reveal likewise the tremendous strides made in a transportation industry that may in time rival the railroads. Indeed, the Goodrich company is taking a leading part in the formulation of plans whereby the region of which Cleveland forms the center, extending to Toledo on one hand and Buffalo on the other, will be traversed by motor trucks, making it possible to move thousands of tons of short-haul freight which has heretofore been handled by the railroads. Return-load bureaus are to be formed with the idea that every machine will be loaded to capacity both coming and going. There seems to be no reason why all the comparatively short-haul and less-than-carload shipments throughout the country cannot be entirely taken off the railroads if similar arrangements are effected by progressive firms in various industrial sections.

The Obituary Record.

A PIONEER MANUFACTURER.

FRANK CAZENOVE JONES, who died on September 20, 1918, at his home, 80 Park avenue, New York, was for many years connected with rubber manufacture in an important way. He was born in Washington, District of Columbia, in

FRANK CAZENOVE JONES

1857. Graduating from Georgetown University, he took an engineering course in Steven's Institute. After a year of travel he became interested in the rubber business, and associated himself with the New York Belting and Packing Company, and in time became general superintendent. In 1893 he, with Arthur F. Townsend and George Woffenden formed the Manhattan Rubber Manufacturing Company, with

Mr. Jones, president; Mr. Townsend, secretary and treasurer, and Mr. Woffenden, superintendent. Ten years later, suffering from nervous breakdown, Mr. Jones disposed of his holdings, resigned as president of the Manhattan, and went away for a rest. His health restored, he again took up business. He became active in the Okonite company, of which he was chairman of the board of directors. He was also interested in certain rubber planting prospects, was president of Cera Company and a director in the New York Lubricating Oil Company.

Mr. Jones was a lineal descendant of John Paul Jones, of Revolutionary fame. He was also a grandson of Commodore Jacob Jones, U. S. N., who was captured with the frigate *Philadelphia* in the war with Algiers, was held a prisoner there for twenty months, and afterward commanded the *Wasp*, which defeated the British sloop *Frolic* in the War of 1812.

Mr. Jones was one of the first to appreciate the value of engineering and of chemistry in rubber manufacture. A man of great energy and enthusiasm, his frail body could not keep pace with his eager spirit. He leaves many warm friends, and no enemies.

PRESIDENT OF BRECK RUBBER CO.

James H. Breck, president and treasurer of the Breck Rubber Co., Springfield, Massachusetts, passed away at his home in Longmeadow on August 2, 1918, at the age of 64. He had been in the rubber business for 38 years and was well known in Springfield business circles.

Mr. Breck was born in Wethersfield, Vermont, but lived the greater part of his life in Springfield. He was married January 15, 1899, and is survived by his widow; a son, Robert Gifford; two brothers, Charles G. and Martin D., both of Springfield; and two sisters, Mrs. C. S. Kempton, of Longmeadow, and Mrs. Clarence Paddock, of Lynn.

Mr. Breck was fond of outdoor sports and fishing and was a member of and an active worker in the local lodge of the Ancient Order of United Workmen.

A WELL-KNOWN BELTING SALESMAN.

James F. Holt, for more than a quarter-century salesman for the Boston Belting Corp., died at the residence of his sister at Spofford, New Hampshire, September 4, aged 70 years.

Mr. Holt was born in Spofford, then known as Chesterfield Factory, June 13, 1847, and was educated in the public schools, also taking a course at Comer's Commercial College in Boston, Massachusetts. He enlisted and served the last year of the Civil War in the 18th New Hampshire Regiment, taking part in several important engagements, and was at one time a dispatch carrier. After being mustered out, he learned the machinist's trade at Spofford, later working on shoe machinery at Lynn, Massachusetts. His first connection with the rubber business was as traveling salesman for the Hall Rubber Co., Boston, covering New England, New York and some western states. Later he joined the sales force of the Revere Rubber Co., and for the last 26 years had been associated with the Boston Belting Corp., covering the paper-mill trade in New England, as well as some other sections of this country and Canada. His practical mechanical experience proved of great value in introducing rubber-covered rolls in paper mills, and he was successful in devising and adapting other kinds of mechanical rubber goods for use in the paper industry.

Mr. Holt was twice married. He is survived by a daughter and grandson. He a 32nd degree Mason, an Odd Fellow, and a member of the Ancient Order of United Workmen, Grand Army of the Republic, Maine Quarter Century Association and the Salem Masonic Club.

Mr. Holt was a typical New England product, an old-fashioned, friendly, traveling salesman, a type becoming exceedingly rare. A Yankee of Yankees, he was known from one end to the other of his territory, and held in the highest regard. Always at home, in the office of the big mill owner, or in the country store, he swapped stories, cracked jokes and held his customers by his geniality, fairness, and knowledge of men and of his wares.

During his illness, he received scores of letters from his friends and customers, and he delighted to talk of his friends and his work until within a few days of his death.

A VETERAN RUBBER SALESMAN.

Watkin W. Griffiths died at the home of his brother in Utica, New York, on September 15. He entered the employ of the Hodgman Rubber Co. in 1875 as general salesman, and was identified with the company until his death, although for the last six or seven years he was not active in business on account of ill health. He was a representative of the old order of rubber salesmen of forty or fifty years ago.

A MAN OF LARGE AND VARIED INTERESTS.

Charles Minor Weld, president of the O'Bannon Corp., manufacturer of carriage cloths and coated fabrics, died August 27 at his home in Milton, Massachusetts, as the result of a shock. He had been in poor health for some months.

Mr. Weld was born in Boston on October 2, 1858. He graduated from Harvard University with the class of 1880, after which he entered a business career and in a very short time was identified with numerous corporations, banks and other interests. For many years he was a member of the dry goods commission house of Amory, Browne & Co., Boston.

He became director and was elected president of the O'Bannon Corp. about four years ago, but could give but little of his time to that concern, being on the directorates of twenty or thirty prominent organizations, including insurance, banking, railroad, textile, and public service corporations.

Mr. Weld was a member of the Somerset, Harvard, and Exchange clubs, of Boston, and the Country Club of Brookline, Massachusetts. He is survived by his widow, two sons, and three daughters.

A FIRE HOSE SYMPOSIUM.

Such well-known hose experts as W. T. Cole, president, Fabric Fire Hose Co.; E. G. Kimmick, experimental department, The Goodyear Tire & Rubber Co.; C. W. Hardin, manager of mechanical sales, The Republic Rubber Co.; S. A. Coombs, assistant general manager, New York Belting & Packing Co.; J. M. Miller, Empire Rubber & Tire Co.; E. Downs, chief chemist, New Jersey Car Spring and Rubber Co., Inc.; and others reply in a very interesting manner to certain questions in "Fire and Water Engineering." In a letter to our contemporary an inquirer refers to the fact that some cities, in their specifications for 2½-inch double-jacket rubber-lined cotton fire hose, allow not more than two revolutions at 400 pounds pressure per square inch and a maximum increase in external diameter of 1/16 inch. He asks what the significance of exceeding one or more of these requirements would be and whether it would matter if the hose had a cemented or a loose inner tube. The replies point out that undue elongation of the hose means that the jacket is woven with a loose warp, or that the fillers are spread too far apart. Stress is also laid on the necessity of using a middling grade of yarn, as Sea Island cotton or grades approximating it would be too elastic. Various serious evils of elongation are pointed out. For instance, if a fireman is at the top of a ladder with a 500-foot line of hose under a working pressure of 125 to 150 pounds and each 50-foot section stretches only 30 inches, a total of 300 inches, and the water is suddenly shut off, or a length of hose bursts somewhere back in the line, the nozzle will immediately be snapped back 300 inches, which is liable to pull the fireman off the ladder or pull down the whole ladder. Or again, when a fireman gets into a position on a roof where it is difficult to stand, when the water is turned on, if the hose pushes forward, it might push the man off the roof. With regard to twisting, as a double jacket hose is composed of two single jackets, the filling threads must run in opposite directions to each other; then, if the two jackets conform perfectly, there will be little or no twist. The objection to twisting is based on the probability of the couplings being loosened if the twist is in the wrong direction. Besides which, if hose stretches excessively, the stretch will be "taken up" in snakes in the line, the water will not travel straight to the fire, it will be retarded by friction, and the pressure will be reduced. Regarding the difference between a cemented or a loose inner tube, it seems that the adhesion has very little to do with the service of the hose. And yet, if the tube were cemented to the inner jacket for part of the surface, it might reduce the likelihood of a loose section of tubing being crowded to the discharge end of the hose while under pressure.

FIRMS JOIN TO EXPAND FOREIGN TRADE.

By grace of the recently enacted Webb-Pomeroy law, permitting American manufacturers to join forces for the purpose of promoting foreign trade, a combination of forty-four important establishments, styled the Allied Industries Corp., with offices at 151 Fifth avenue, New York City, has been formed to introduce American goods abroad and promote trade with the seventy foreign markets of the world now open for immediate and systematic development. Over \$100,000,000 in domestic annual sales is

represented in the merger, of which Alfred I. duPont, of Wilmington, Delaware, is chairman, and which is affiliated with the French-American Constructive Corp.

The Allied Industries Corp. will represent responsible manufacturers and sell their goods under their own trade marks at a selling commission based on the amount of goods sold and shipped, plus a bonus on a guaranteed minimum sale. For the first group of manufacturers there will be no advance selling charges or fee. The corporation is financed to take the initial risk and burden of expense, enabling it to extend credits to responsible foreign buyers when necessary and at the same time securing immediate cash payments for its American clients at a fractional discount.

Representatives will be located in the various foreign markets and permanent expositions will show American products in New York, London, Paris and other trade centers for the benefit of foreign buyers. Negotiations are in progress with 658 firms, and the firms so far allied with the corporation include makers of rubber articles and toys, textile goods, chemicals, etc. It is stated that an important business in rubber products will be done.

RAINCOAT MEN TO GET A BILL OF PARTICULARS.

The raincoat manufacturers indicted under the Sabotage Act have made the first move in their defense, resulting in an order issued by Judge J. C. Hutcheson in the Criminal Branch of the United States Federal Court, directing the Government to furnish the defendants with a bill of particulars concerning the alleged imperfections in the garments supplied by them. The manufacturers contend that the raincoats were made according to specifications and that after acceptance by the Government inspectors their responsibility as manufacturers ceased.

FIRST RAINCOAT FRAUD CASE TRIAL BEGINS.

The trial of the first of the raincoat fraud cases was opened before Judge E. J. Hutcheson in the Criminal Branch of the United States District Court at New York, on September 17. In this first case there are three defendants, Captain Aubrey W. Vaughan, of the Quartermaster General's Office, Felix Gould, a promoter, and David L. Podell, a lawyer. More than a score of men are involved and will be tried separately. Captain Vaughan has pleaded guilty to a charge of bribery and is expected to appear as a witness for the Government. It is alleged, among other things, that the H. Rosenfeld Raincoat Co. was incorporated mainly for the purpose of concealing the true nature of the transactions to be carried out.

INCREASED PRODUCTION OF GILSONITE AND OZOKERITE.

The native bitumen, including gilsonite, elaterite and ozokerite, marketed from mines and quarries in the United States in 1917 was 80,904 short tons, a loss of 17,573 tons, or 18 per cent, compared with 1916. The market value of the output in 1917 was \$735,924, a loss of \$187,357, or 20 per cent, compared with 1916.

The production of gilsonite and ozokerite was increased considerably in 1917, but the gain credited to these varieties was insufficient to offset the loss in the production of elaterite and other products.

MAGNESITE.

Magnesium carbonate and the light and heavy calcined magnesite used in the rubber trade are derived from the mineral magnesite, of which extensive deposits are found in the state of California and Washington. These sources of magnesite render the United States independent of overseas sources and the domestic supply is much more free from lime than Canadian magnesite, which comes from Grenville, Quebec. The United States Geological Survey estimates that the domestic production for the entire year 1918 may be about 225,000 tons as against 316,000 tons in 1917.

Scientific Inspection of Raincoats in Shops Manufacturing on Section Basis.

By H. Thorpe Kessler.

THE solution of every problem in manufacturing depends largely on proper planning.

The careful and systematic inspection of raincoats requires the same "tactics" one would apply to other commodities.

To maintain a standard of quality at a time when production standards are being revised from day to day, and if the added production is to be made with apprentice help, it demands a close and constant adherence to instructions.

Before a new piecework price can be scientifically set, one must make a careful study of both the time element and necessary motions.

When this company made its first deliveries of slickers (now called raincoats) to the United States Government, only one examination was made of the garment. If all the garments were made by competent employes this method properly supervised would be sufficient. However, the majority of garments are being sewed, cemented and finished by workers who but recently have become acquainted with this trade. Final examining alone does not prevent the poorly stitched or cemented seam.

For the reason just outlined, we introduced into our shops sectional inspection with decided success. To make the method clear, we refer to the various inspections as sectional inspection, departmental inspection, and final inspection.

SECTIONAL INSPECTION.

In each division is an inspector whose sole duty is to see that those parts of the garment sewed or cemented in that section are all in accordance with government specifications both as to measurement and quality. Records are kept in each shop which indicate the clock number of employe working on every part of the garment. The inspectors are responsible to the management—not the shop manager or foreman of the section. In case the work of any employe is not up to standard, the inspector is instructed to call the section foreman's attention to the unsatisfactory work. If the work complained of is not remedied at once, the inspector's duty is to report the matter to the shop manager. The poor work is then reported directly to the general manager, providing the shop manager does not improve the work.

DEPARTMENTAL INSPECTION.

In each shop there are a number of departmental inspectors who look over the garment for either poor cementing or unsatisfactory sewing. Each inspector examines the coat only for defects in the department he represents. This means that each garment is handled by two different departmental inspectors.

While this is a duplication of work in handling the garment, it has secured better results and will be continued until the working force is thoroughly competent. A thoroughly competent force would mean that gross rejections should not exceed six per cent.

FINAL INSPECTION.

The final inspection is guided by the following instructions:

EXAMINERS' INSTRUCTIONS.

GOVERNMENT RAINCOAT. (Specification No. 1317.)

1. Turn right and left sleeve inside out:
 - a. Bottom $\frac{1}{2}$ inch D. S.—raw edge.
 - b. Strapping top sleeve.
 - c. Cementing under sleeve.
 - d. Reinforcement and hardware.
2. Turn both sleeves right side out.

3. Shoulder tabs:
 - a. Two inches at shoulder seam.
 - b. Tapers to $1\frac{1}{2}$ inches at top.
 - c. Top $\frac{1}{4}$ inch from stand.
4. Collar:
 - a. Top 4 inches wide.
 - b. Cementing; special attention.
 - c. Tabs securely tacked.
 - d. Test buttons.
 - e. Turn top collar—note undercollar stitching.
 - f. Stitching undercollar at corners.
 - g. Test hanger.
5. Yoke:
 - a. $12\frac{1}{2}$ inches deep from bottom stand.
 - b. Bottom $\frac{1}{2}$ inch D. S.—raw edge.
 - c. Stitching at bottom.
6. Eyelets: (4) Left.
7. Side seam—cementing—right.
8. Pocket: Left.
 - a. Opening $7\frac{1}{2}$ inches.
 - b. Inside stitching, $13\frac{1}{2}$ inches by $8\frac{3}{4}$ inches.
 - c. Three rows stitching, $3/16$ inch apart.
 - d. Test tacking top and bottom.
9. Clasp: Right.
10. Bottom:
 - a. Hemmed $\frac{1}{2}$ inch D. S.
 - b. Stitching at corners and across bottom.
11. Left facing:
 - a. Fly, 29 inches long, 4 inches at second take-up.
 - b. Stitching of fly.
 - c. Take-ups securely riveted.
 - d. Bottom of fly tacked.
12. Pocket: right same as No. 8.
13. Eyelets: (4) right.
14. Side seam cementing right.
15. Turn coat inside out.
16. Right facing:
 - a. Compare length.
 - b. Claps and take-ups even.
 - c. Test caps.
 - d. Button even with button-hole, 8 inches from bottom.
17. Strapping:
 - a. Width $1\frac{1}{2}$ inches.
 - b. Shoulder seam.
 - c. Armhole.
 - d. Facing.
 - e. Pocket.
 - f. Ventilation.
 - g. Side seam.
 - Test all strapping.
18. Contractors' stamp—must be distinct.
19. Turn coat—see No. 17.
20. Test caps on take-ups.
21. Put your number under yoke.

There may be some difference of opinion as to the proper method of examining a garment. In connection with our study, we asked a score of examiners to show us their methods of handling a garment. A careful comparison of our notes indicated that no two men handled the coat alike.

Our next step was to conduct a written examination to learn which parts of the garment were overlooked.

For several months, each final inspector has handled the coat in the order outlined in the instructions. Each week all inspectors are called together and a report is read giving the total number of rejects received from the quartermaster during the previous week, the percentage, the reasons for their return, and the number of rejected garments examined by each inspector.

After reading the weekly report, the accumulated totals are read and the standing of each inspector both as to quantity and quality is determined.

A minimum rate is paid all examiners; promotion and increase in pay is entirely determined from their record as shown by rejection reports by inspectors.

After a shipment of rejections is received and the count is verified, the following information is secured: number of coats rejected by reason; number of coats rejected by shops and reason; number of coats rejected by inspectors.

These figures are posted to a report with accumulative totals and percentages.

Each sectional, divisional, and final inspector is shown re-

jected coats which were originally passed by him. In this way each inspector can see his own careless work.

The "display" of rejected coats is held once each week at which time a meeting is called to go over the weekly report of rejects.

The report on rejects is then handed over to the chief inspector whose sole duty is to improve the work in that section of the shop where the largest percentage of rejections has occurred.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(658.) A reader requests the address of a manufacturer of rubber bulbs.

(659.) A subscriber requests the addresses of importers of rubber goods in the United States, Canada, and South America.

(660.) An inquiry has been received for the addresses of manufacturers of the latest machinery for the manufacture of rubber footwear such as overshoes, gaiters, and boots.

(661.) A reader requests information as to where he can purchase transfers for printing on inner tubes.

(662.) A vulcanizing concern requests the addresses of proofers of cloth.

(663.) A subscriber asks for the name of a manufacturer of hose-winding machinery.

(664.) An importing and exporting concern requests the address of a manufacturer of tapping tools for use on *Hevea* trees.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce or its district or co-operative offices. Request for each should be on a separate sheet, and state number.

(27,381.) A representative of a Dutch firm in the East Indies and Singapore, at present in the United States, desires to get in touch with manufacturers of sulphur, caustic soda, rosin, zinc white, linseed oil.

(27,394.) An agency is desired by a firm in France for rubber shoes.

ATHLETIC MATERIAL FOR MEN AT TRAINING CAMPS.

The War Department Commission on Training Camp Activities announces that athletic material sufficient to supply 1,750 companies, or 125 complete regiments, has been purchased, an appropriation of \$250,000 having been obtained for this purpose.

The supplies include among other items, 3,000 Rugby footballs, 7,000 soccer footballs, 3,500 volley balls, and 1,750 medicine balls.

As part of the commission's campaign to raise funds for the purchase of athletic equipment for the camps, it is announced that with the sum of \$3,600 obtained from the United States National Lawn Tennis Association the commission has purchased and distributed 2,700 balls and many rackets and nets.

NO ENEMY INTEREST IN EBERHARD FABER RUBBER CO.

The business of A. W. Faber, of Newark, New Jersey, that was sold by the Alien Property Custodian on September 17 should not be confused with the Eberhard Faber Rubber Co., Brooklyn, New York, or the Eberhard Faber Pencil Co., Newark, New Jersey, because the records disclose no enemy interest in either of the latter companies or in the partnership of Eberhard Faber, which is the sales organization of the Eberhard Faber companies.

SCRAP RUBBER DIVISION, NATIONAL ASSOCIATION OF WASTE MATERIAL DEALERS.

THE fall quarterly meeting of the National Association of Waste Material Dealers was held at the Hotel Astor, New York City, on Tuesday and Wednesday, September 24 and 25, at which time the Scrap Rubber Division, David Fineberg, chairman, met and discussed matters of interest in a "win the war" spirit of conservation, evident throughout the proceedings. The proposal was discussed to limit bales of waste rubber to a maximum weight of 1,500 pounds as an aid to handling at docks and warehouses where labor is scarce. Some dealers make a practice of putting up unwieldy bales of 2,500 to 3,000 pounds. Mr. Ralph Loewenthal suggested that the question of bale weight ought to be studied experimentally to determine the most suitable weight as regards economy of space, burlap and labor. The meeting, however, took no action.

The Interstate Commerce Commission Classification Committee has held hearings in New York the past summer at which the scrap-rubber dealers were represented in protest against the proposed requirement of tying bundles of scrap automobile tires in three places with steel baling wire to secure fourth-class shipping rates. Secretary Charles M. Haskins of the Scrap Rubber Dealers Section, argued in favor of permitting optional use of one-quarter-inch diameter rope, wrapped twice and tied in three places on the bundles. Photographs were exhibited illustrating the use of both wire and rope ties and report made of a practical test by shipment of sample rope-tied bundles which arrived at destination in perfectly secure condition. The "density" of such a bale measuring 34 inches diameter by 18 inches thick is 13¾ pounds per cubic foot occupied. The committee proposed that rope-tied bundles should bear third-class rate, and has taken under advisement the proposed optional use of rope or wire ties at fourth-class rate.

The scrap-rubber dealers welcome the recent appointment of two of their number, Messrs. Ralph M. Loewenthal and Herman Muehlstein, on a joint arbitration committee with the rubber reclaimers for the settlement of disputes arising over questions of acceptance of deliveries, etc.

NEW OFFICERS OF INTERNATIONAL STAMP MANUFACTURERS' ASSOCIATION.

At the annual convention of the International Stamp Manufacturers' Association in Detroit, Michigan, the following officers were elected for the coming year: R. F. Hershey, Pittsburgh, Pennsylvania, president; Charles L. Safford, Chicago, Illinois, first vice-president; Thomas Wright, Cincinnati, Ohio, second vice-president; Bert A. Stewart, Philadelphia, Pennsylvania, third vice-president; E. Q. Cannon, Salt Lake City, Utah, fourth vice-president; A. Woodruff, Auburn, New York, treasurer; F. A. Rees, Chicago, Illinois; secretary; auditors—J. P. Solomon, Detroit, Michigan; Stan. Bevan, Kansas City, Missouri; A. A. Adams, St. Louis, Missouri; directors—William Jenkins, chairman, Pittsburgh, Pennsylvania; George Westbrook, Hartford, Connecticut; G. Fred Hiss, Columbus, Ohio; M. L. Willard, Chicago, Illinois, and B. Cairns, Toronto, Ontario, Canada.

SALE OF A. W. FABER NOT APPROVED.

The plant of A. W. Faber, Newark, New Jersey, maker of stationers' rubber goods, was sold at public auction by the Alien Property Custodian, September 17, for \$145,000, to Theodore Friedeburg, 30 Church street, New York. Weldon Roberts, of the Weldon Roberts Rubber Co., Newark, New Jersey, was the only other bidder. The sale, however, was not approved by the advisory board and the matter was referred to the sales department in Washington, which will decide whether the property will be readvertised or what disposition will be made of it.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

THE rubber manufacturers of this city and vicinity have been handicapped for a long time by the desertion of many of their workers to other industries. Many employees, male and female, have found that munition factories and other war-work establishments pay larger wages, and as a consequence rubber workers have decreased materially in number. It is anticipated that the new draft will cause an even greater reduction of available rubber workers, unless the men drafted are pronounced essential to the carrying on of the war. Every day more and more women are being taught to do work which hitherto had been considered men's exclusively, and it is but fair to say that in many cases the experiments have proved successful. Just at this writing, however, a very serious additional shortage of help is noted because of the semi-epidemic of "Spanish Influenza" or old-fashioned grip, which is decimating some of the rubber-factory forces. It is hoped, however, that this is but temporary, and that the presence, in most of the factories, of medical advisers, who are instructing the help in preventive measures, will soon overcome this difficulty.

Patriotism runs strong at the plant of The Fisk Rubber Co., at Chicopee Falls, Massachusetts. The working forces have not only contributed their share in supporting the various organiza-

LIBERTY CHORUS REHEARSAL AT THE FISK RUBBER CO. FACTORY.

tions, and in buying Liberty Bonds, but are also ably represented in the rank and file "over there." The knitters and Red Cross workers are busy at the noon hour and after the work-day is over. The war gardens have been well tilled and are now being harvested. The Liberty Chorus is the latest activity planned along the line of the government suggestion of community singing. The organization has a trained leader, and a small portable organ is used, the rehearsals being held at the noon hour, Thursdays for the factory group, and Fridays for the Administration Building group. Occasionally, when the weather is suitable, both groups unite in an open-air rehearsal. The progress made is most satisfactory, and the result will be that in any community sing which may be held in Springfield or Chicopee, the "Fiskers" will do their full share in adding their volume and harmony.

Speaking of war gardens, those of the Boston Rubber Shoe Co. Factory No. 2 at Melrose are yielding well, showing that rubber workers are excellent amateur farmers. There are nearly 200 such plots on land contiguous to the big factory. Each of these is 40 feet square. The land is furnished free, and is plowed, harrowed and fertilized by the company, which also furnished the seeds at cost. The main crop this year is potatoes, although a large quantity of other vegetables was planted. In addition to the gardens of the employees, the company also planted several acres of potatoes, and one acre of corn.

N. Lincoln Greene, of the clothing division of the United States

Rubber Co., is a busy man at all times, but especially so just now, as he is making frequent trips to Washington in his capacity as chairman of the clothing division of the War Service Committee of the Rubber Industry, a committee which includes every manufacturer of rubber clothing in the country, if, as the said committee claims, the term "manufacturer" means a concern which makes its own cements and coats and vulcanizes its own fabrics, making up these into clothing. Those houses which purchase their fabrics already vulcanized, and their cement, according to the same authority, should be termed "makers." The distinction is worth adopting. At the present writing, Mr. Greene is in Washington in conference regarding specifications for the new coats to be made for the Navy. These will be double-faced textile with rubber between; and the coats made complete before vulcanization, which specification will confine the contracts to "manufacturers," none of the "makers" having facilities for this method of production.

The Davidson Rubber Co., in the Charlestown district of this city, finds that the elimination of styles has worked advantageously in its lines of water bottles and fountain syringes. Whereas three years ago more than 40 numbers were represented in these two items, to-day the company is manufacturing but two numbers of each, in two colors, and the result is that in this limited variety the orders aggregate far more than their production of the greater number of styles of the former period. Like all other concerns, the scarcity of help is a problem difficult of solution, but the steadily increased volume of output tends to show that measures taken to meet the difficulty promise success.

The A. S. Brock Rubber Co., manufacturer of hard-rubber specialties, of this city, with a factory in Lynn, is busy on government work, with enough rubber allotted to fill its contracts with the Government, but finds difficulty in obtaining enough to fill its orders from the regular trade. In this emergency it is using some of its machinery, usually employed on hard rubber, in finishing machine parts of metal. Like all other manufacturers, the war industries and the army demands have made inroads in the working force, in addition to which, at present writing, 30 per cent of its employees are away from the factory, because of the prevailing epidemic of influenza.

Mention is made elsewhere in this number of the release of Mr. Kidder, manager of the Boston branch of the United States Tire Co., that he may be enabled to serve under Charles A. Schwab in the Emergency Fleet Corporation. Almost simultaneously with his departure for this service, but in no wise because of it, his assistant, John C. Toomey, who has been connected with this branch for nine years, resigned in order to accept an important position with the L. A. Young Industries, Inc., Detroit, Michigan.

The recent cancellation of Government raincoat contracts because of alleged irregularities of some makers has redounded to the benefit of the United States Rubber Co., large additional orders having been placed, which results in greater activity than ever at the Cambridge and Stoughton factories of that company.

S. P. Sharples, the veteran analytical chemist well known in rubber manufacturing circles, who suffered a light shock last spring and has been away recuperating all summer, is again on deck with the same ambition for work which has characterized him for many years.

Roy Fraser has been appointed manager of the Boston office of the Pennsylvania Rubber Co., Jeannette, Pennsylvania. He was formerly a member of the Roy C. Fraser Co., of Montreal, Quebec, Canada.

Frank Venn has sold all interest in the business and patents of the Venn marker to the Boston Rubber Shoe Co., Malden, Massachusetts, a subsidiary of the United States Rubber Co.

Robert H. Montgomery succeeds William J. McNeill as local manager of The B. F. Goodrich Rubber Co., of Akron, Ohio, in Worcester, Massachusetts. Mr. McNeill entered government service in June.

Farley & MacNeill, 105-107 Federal street, Boston, have been appointed by the Dural Rubber Corp., Flemington, New Jersey, exclusive distributors for that company in Massachusetts and Rhode Island.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE ominous clouds caused by labor disturbances, that overshadowed the plants of the United States Rubber Co. at Bristol, Woonsocket, and Millville, for nearly two months were dispelled about the middle of September. After numerous conferences between the employees and the management of each plant concerned, an amicable understanding was finally reached, satisfactory adjustments made, and the operatives returned to their work.

In the meanwhile advantage was taken of the enforced idleness to make numerous repairs, renovations, and improvements necessitated by the unprecedentedly long period of constant operation at capacity speed, so that when the mills resumed they were in better condition than at any time for many months previous.

Improvements and extensions at the plant of the National India Rubber Co. at Bristol include not only additional buildings and equipment at the plant itself, but the establishment of several features of a social and economic character for the comfort and welfare of the employees. In addition to opening a restaurant at the mill, the company has recently purchased a large dwelling house and lot of land at the corner of High and Bourn streets. The house is to be remodeled and used as a day nursery for small children of the employees.

The newly erected brick addition to the plant has been completed and is being occupied and used exclusively for the production of footwear.

The Lynn Rubber Manufacturing Co. has completed the first of the buildings at its new plant at Warren and has begun the manufacture of rubber shoe-heels and soles. The plant is favorably situated in the east part of the town near the yards and station of the New York, New Haven and Hartford railroad. Further mention of the company's plans was made in the issues of THE INDIA RUBBER WORLD of April 1 and May 1, 1918.

Arrangements are well under way at the plant of the Alice Mill, of the Woonsocket Rubber Co., at Woonsocket, for the establishing of a department for the making of rubber boots. This is the first time since the erection of the Woonsocket mill that this move has been contemplated. Up to the present time the entire floor space of the Alice mill has been used for the manufacture of rubber shoes.

Thomas W. Dwyer, who was employed for a number of years at the factory of the National India Rubber Co., has received his commission as a second lieutenant in the Army after completing training at the officers' training school at Camp Lee, Petersburg, Virginia, where he has been since June 29. Previous to going to Camp Lee he was a sergeant at Camp Devens, Ayer, Massachusetts, having been appointed soon after his enrollment in the National Army.

Included in the list of individuals, firms and corporations assessed on valuations of \$50,000 and over in the annual report of the Board of Tax Assessors of Providence, as filed a few days ago with the City Treasurer, are the following identified with the rubber industry: American Multiple Fabric Co., \$94,380; Walter S. Ballou, \$86,840; Joseph Banigan Estate, \$1,045,580; Augustus O. Bourn, \$84,640; Bourn Rubber Co., \$180,300; Samuel P. Colt, \$219,060; Davol Rubber Co., \$500,000; Glendale Elastic Fabric Co., \$177,300; Joslin Manufacturing Co., \$485,080; Mechanical Fabric Co., \$190,200; Revere Rubber Co., \$830,100; United States Rubber Co., \$1,462,600.

Henry C. Wagner, superintendent of the Alice Mill, of the Woonsocket Rubber Co., was operated on at the Woonsocket Hospital, September 6 for gall stones and appendicitis.

Miss Anna C. Doran has resigned her position as school nurse in the public schools of Woonsocket to accept the position of nurse at the Woonsocket Rubber Co., succeeding Miss Essie McDonald, who has entered Red Cross work.

George A. Cragin, for the past two years general sales manager of the National India Rubber Co., Bristol, has resigned on account of ill health and returned to his home at Worcester, Massachusetts.

Amendments to articles of association have been filed at the office of the Secretary of State under the laws of Rhode Island, by the Glenwood Manufacturing Co., represented by Elmer K. Watson, president, and Alice M. Clark, secretary, for the purpose of engaging in the business of manufacturing and selling of textiles, fabrics, felts, rubber goods, and goods from raw materials.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

WHILE Trenton rubber manufacturers are 100 per cent patriotic and always willing to help the Government in the winning of the great war, they were surprised when informed that the Federal order restricting the output of tires would be extended to the first of the year. The news also surprised the many workmen who were laid off the first of August, who were of the belief that they would secure their old positions the first of October. Some of the tire-makers are working at other positions while the order is in effect.

The order of the War Industries Board calling for the elimination of many styles of rubber footwear for the duration of the war will not affect Trenton rubber industries. The Essex Rubber Co., Inc., is a big producer of rubber heels and soles, but no order has been received to change the style of the heels and soles now being made.

Rev. Joseph Howell, of Easton, Pennsylvania, who was pastor of the Presbyterian Church at Hamilton Square, New Jersey, has taken a position at the Mercer Rubber Co.'s plant at the latter place. He announces that he will turn his salary over to the Trenton Chapter of the American Red Cross.

John A. Lambert, treasurer and general manager of the Acme Rubber Manufacturing Co., has been appointed a member of the Community Board of the Trenton district and will assist the Federal-State Municipal Employment Bureau in the Municipal building, Trenton.

Joseph K. Lambert, assistant manager of the tire manufacturing department of the Acme Rubber Manufacturing Co., who enlisted in the Navy last June, is now stationed in the

Fourth Naval District, Philadelphia, Pennsylvania. He is the son of John A. Lambert, treasurer and general manager of the Acme company.

* * *

William J. B. Stokes, treasurer of the Thermoid Rubber Co., vice-president and treasurer of the Joseph Stokes Rubber Co., and vice-president of the Home Rubber Co., has been appointed chairman of the new Liberty Loan Committee for Trenton and Mercer County. An office has been opened in the center of the city, and there Mr. Stokes, who recently celebrated his sixtieth birthday anniversary, daily attends to the war-financing campaign, besides keeping in touch with his several rubber interests.

A MONTHLY ACCIDENT CHART.

In a campaign to reduce the number of accidents due for the most part to carelessness, The Federal Rubber Co., Cudahy, Wisconsin, is posting conspicuously in the factory a chart of the accidents for the previous month. The total number of accidents and the number of productive hours lost thereby are

stated, and the percentage for each part of the body is given. All employees are urged to sign a pledge to do and avoid certain simple things which will tend to avoid accidents.

THE KREBS MINING CO. INCORPORATES.

The Krebs Mining Co. has recently filed notice of incorporation in Delaware and will take over the mining interests of The Krebs Pigment & Chemical Co. of Newport, Delaware, manufacturer of Ponolith, in the states of Georgia, and Tennessee, where it has succeeded in locating and acquiring large deposits of ore and has erected washers and ore-dressing plants to prepare this for the manufacture of lithopone.

THE PIONEER ASPHALT CO. MANUFACTURING AGAIN.

The Pioneer Asphalt Co., Lawrenceville, Illinois, subsequent to the fire which destroyed its plant in July, has been endeavoring to dispose of its small existing stock of mineral rubber in an equitable manner and is now manufacturing it again, although in necessarily limited quantity. The company is now under new management and conducting rebuilding operations. When these are completed it hopes to give better material and service than ever before.

NEW YORK BELTING & PACKING CO., EXPANDS.

The New York Belting & Packing Co. is making extensive additions and alterations to its plant at Passaic, New Jersey. Several modern reinforced concrete buildings in course of

construction include two large five-story factories, a power house, and an enlarged office building. Machinery is being installed and direct-connected electric power is provided wherever practicable. A completely equipped machine shop provides facilities for mold making as well as the upkeep and construction of machinery.

PLANT OF THE NEW YORK BELTING & PACKING CO.

A very efficient plan has been developed to coordinate all departments and facilitate the progress through the plant of all goods in the various stages of manufacture. Greatly increased facilities are provided for the manufacture of power and conveyor belting, hose of all kinds, packings and special molded goods.

ALLEN MACHINE CO. EXPANDS.

The Allen Machine Co., Erie, Pennsylvania, manufacturer of hydraulic and rubber mill machinery, has recently acquired the plant and equipment of the Nagle Corliss Engine Works, to which it is moving its offices and adding the equipment of its own old plant. The newly acquired property includes, besides the heating system and various other buildings, a foundry 125 by 250 feet, equipped with traveling cranes and a main machine shop 130 by 332 feet, with a balcony 60 by 250 feet, also fitted with cranes. The Allen Company plans to cast its own rolls for rubber mills and calenders, as well as machining them.

LACQUER FOR SOLID TIRE STEEL RIMS.

The specifications of the United States Army, Ordnance and Quartermaster's Departments require that the steel rims of solid rubber tires shall be painted with a removable waterproof anti-rust material. A varnish-like preparation, known as Blue Removable Lacquer, originally prepared for protecting the bright parts of machinery, has been found to meet perfectly the specified requirements. This coating gives a blue semi-transparent coating and protects the metal from rusting while in transit. It may be removed with kerosene, gasoline, or turpentine, even two years after it is applied.

A GOODRICH DISTINCTION.

For the enlightenment of such of our readers as may be interested, we have secured the following information:

The B. F. Goodrich Co. is a New York corporation, with its principal office at 1780 Broadway, New York City, and its factory at Akron, Ohio, where it manufactures rubber goods of various kinds.

The B. F. Goodrich Rubber Co. is a Michigan corporation which is a subsidiary of The B. F. Goodrich Co., having its principal office at Detroit, Michigan, and its main business office at Akron, Ohio. This company sells the products of The B. F. Goodrich Co.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

WHEN I had the privilege the other day of seeing a review of American troops—and what big crowds they attracted—I was wondering how many of them came from Akron and other homes of the rubber industry. This inquisitive trait of mine cannot, of course, be satisfied, but at any rate I have been satisfied upon one point, and that is that the American soldier can smile, for I saw one in the act. The solemnity of the American when marching has been much commented on in Britain, though at the same time it can hardly be said that the business on which he or any other soldier is engaged is a laughing matter.

There is nothing new to be said about raw rubber, except that the gloom is deepening on the faces of shareholders who have become accustomed to 50 per cent dividends. Interest has centered a good deal around certain low-grade qualities which are in demand for special purposes. Pontianak, for instance, is difficult to obtain and odd lots of such brands as accra flake have come upon the market to take its place, having been rescued from the oblivion which is their normal due. As so much of the rubber work in progress is of good quality for government purposes the difficulty of getting hold of low-grade rubber has not caused much inconvenience.

So far as the details of the proposed luxury tax have been made public, there is not much to perturb the rubber trade. A mackintosh is not a luxury unless it costs more than \$24.20, which is a much higher price than is usually paid. Of course, even in peace-time one could pay as much for a special article marketed by one or two noted London firms, but these were mainly sold to officers and sportsmen, and as such purchasers will now buy them for service purposes they will not pay the tax. Waterproof clothing generally, as purchased in the shops, has shown a great rise in the last year, owing mainly to the rise in textiles and labor costs, and it may be said generally that the retail price of a year ago is the wholesale price of to-day. Thus the men's popular woven twill mackintosh has gone up from \$5.08 to \$8.47. The cloth in these garments has gone up from 18 cents per single yard to 60 cents.

Lawn tennis balls are in short supply this summer, the price being up 50 per cent. Many dealers are sold out and are unable to replenish their stocks. This is due to shortage of labor in the rubber works for this and other non-essential goods.

RUBBER SUBSTITUTE.

In recent correspondence I referred to an impending famine in substitutes, owing to the failure of supply of vegetable oils. This contretemps, however, seems to have been averted, as rubber manufacturers are still able to get fair supplies. The modern method of neutralizing any free acid by addition of alkalies or alkaline earths, of course increases the weight of substitutes obtainable from a given weight of oil, and it is not surprising that under present conditions the amount of mineral matter thus introduced for this specific purpose shows a tendency to increase. I am referring now to ordinary oil substitute. We have also on the market some special substitutes containing much larger amounts of some inert mineral matter. I fail to see the advantage of buying them, unless the price paid is pro rata to their organic matter content. If the full price of ordinary substitute is paid, it seems to be one of those cases not uncommon in the rubber trade, where the price paid depends largely upon the degree of credulity with which the vaunted virtues of the particular material are received. With regard to the use of oil substitute the general position is abnormal. For one thing, we

have first-quality rubber at 48 cents per pound, and substitute at 18 or 20 cents, so that the inducement to its use is by no means so strong as when rubber was higher and substitute half its present price. Again, the proofing works, which have always been the largest consumers, are now very largely and in some cases entirely engaged on government work in which the use of substitute is barred. There is now little opportunity for the manufacture of the cheap waterproof clothing in which so much substitute commonly masquerades as rubber. A large quantity of substitute has always been used in cheap goods of this sort in preference to mineral matter, because of the suppleness it gives to the goods. As this class of work has never attained the dimensions in America that it has in Britain, and vice versa, as regards the manufacturer of galoshes, we have here an explanation of the greater use of substitute in Britain than in America, as also of the larger use of reclaimed rubber in America than in Britain. With the present stupendous army requirement in America the position is of course materially altered, and as some at least of the American army clothing specifications call for the use of substitute, we may take it that its use will be more general in American practice than it has been in the past. I may remark in conclusion that this paragraph was written before I had read the interesting article on rubber substitute by André Dubosc in the July issue of THE INDIA RUBBER WORLD. At present we hear only of white and brown substitutes, but I can remember the time when white substitute was called Scott's and brown substitute was always called French substitute, as it was only procurable from Lufbury & Chardonner, whose works were at Chaunay.

BITUMINOUS BODIES.

That versatile journal of America, "Metallurgical and Chemical Engineering," which is rather fond of changing its title, has also had an article on rubber substitutes, by Andrew H. King. I have read with special interest the portion relating to asphaltic materials, which are better understood as regards use with rubber in America than in Europe. During the last year or so, presumably owing to shipping difficulties, there has been difficulty in getting supplies of M R or other American bodies of like nature, and various substitutes have been tried. England has plenty of cheap pitch, but it is not at all popular in the rubber trade, owing to its smell when heated. Moreover, it contains varying proportions of free carbon, which affect its tenacity as a binding material. The scarcity of M R, and also of that popular body petroleum pitch, has led to experiments being made to improve the properties of coal-tar pitch so as to enable it to be used with rubber. These experiments, however, as far as I am familiar with them, have not had any success, mainly, I think, because the new products still retained the familiar smell. Mr. King draws attention to the fact that M R containing Gilsonite combines with sulphur and only dissolves to a limited extent in the ordinary solvents used in rubber analysis, thus making impossible a correct estimate of the rubber per cent. I am not sure that this applies only when Gilsonite is present. Anyhow, the whole subject of the analysis of rubber containing asphaltic bodies is a complicated one, and sympathy is due to the chemist who undertakes such work light-heartedly, unless he has had previous experience. Much the same may be said of the analysis of these asphaltic bodies alone. It is by no means easy to say whether one sample is as good as another, or whether deliveries are up to sample. Too much reliance should not be laid on analytical results in the case of material of this sort, and at

any rate it is useless to expect a reply of value by return mail. The subject of artificial asphalts is attracting much attention at the present time, though not specially in connection with the rubber industry, and we seem to be on the eve of developments likely to prove of considerable commercial importance.

NEW WATERPROOFING WORKS.

The Fabric Rubber Co., Limited, has been registered with a capital of £25,000, the directors being M. F. Frankenburg, S. T. Rowe, and H. Standring. These names will at once suggest to

British readers familiar with the proofing trade that I. Frankenburg & Sons, Limited, is in it. This is the case, the new works being really an offshoot of the well-known Salford firm for the manufacture of goods mainly for government requirements, though the company will continue in business after the war. The premises consist of the new buildings recently erected by the waterproofing firm of Ferguson Spicer and Co. at Fadswaite, near Manchester, the change of ownership having been effected before the latter firm had occupied the new premises.

Miscellaneous Foreign Notes.

FRENCH NOTES.

RUBBER AT THE COLONIAL AGRICULTURAL CONGRESS AT PARIS.
FURTHER details concerning the decisions made at the Rubber Section of the Colonial Agricultural Congress, mention of which was made in a recent issue of THE INDIA RUBBER WORLD, have just been received.

At the second sitting the principal question discussed was that of the creation of a crude rubber market in France. The unanimous opinion was that at the conclusion of hostilities, a market for crude rubber should be established either at Paris or at one of the large ports.

With regard to the creation of a Technical Bureau for Rubber at Marseilles, the Section considered that such an organization was a valuable accessory to a rubber market and further requested that:

- (1) French shipping companies lower their freight rates on imports to correspond with charges of foreign companies;
- (2) The facilities of the large ports be improved in order to decrease costs of transit, maintenance, storage, etc.
- (3) Railroad companies regulate their tariff from the ports so as to favor both the importation of rubber into France and its exportation from the country.

At subsequent sittings, *Hevea* cultivation in Cochin China was the main topic. In a recent issue of the "Annales des Planteurs de Caoutchouc de l'Indochine," the exports from this colony during the year 1917 amounted to 977,879 kilos, or a total of about 1,006 tons, when 28,190 kilos of dry rubber, which could not be shipped for lack of freight, is included.

After some preliminary discussion the Section expressed the desirability of passing liberal laws regarding the alienation of rubber lands in Cochin China and recommended that all possible measures be taken to hasten the issuance of concessions. It further suggested that the utmost should be done, particularly in Indo-China, to complete and develop roads to facilitate the opening up of the immense territories suitable for rubber cultivation. Finally the need for the speedy creation of laboratories for research in the principal colonies, especially in Indo-China, was urged.

At the final sitting, the need was shown for a more favorable fiscal policy with regard to wild rubber in Africa, so as to give local producers a better chance against competitors in other parts of the world.

CONSUMPTION OF RUBBER DURING 1917.

During 1917 French rubber manufacturers consumed a total of 19,731 tons of rubber, comprising 4,432 tons of Pará and other Brazilian grades; 8,549 tons of first latex crêpe, and smoked sheet; 4,501 tons of brown plantation crêpe, and 2,247 tons of Congo rubber and similar sorts. At the same time French colonies produced a total of about 7,000 tons of rubber, including 1,000 tons of plantation rubber from Indo-China; 3,000 tons of French West African sheets and strings; 1,200 tons of French East African Upper Congo black; 700 tons of Congo red; 600 tons of inferior grades and 500 tons of rubber from vines and similar plants.

Of this quantity the local industry used only 3,247 tons, in-

cluding approximately 1,000 tons of Indo-China plantation rubber, so that 3,753 tons of African grades were yet to be placed.

M. Jung, president of the Rubber Syndicate, considers that if the French rubber men would substitute the African rubber for brown crêpe, the whole output of the French colonies could be utilized in France. He advocated that efforts should be made towards this end, both by the manufacturers and producers, the former by employing the rubber, and the latter by improving their product.

IRISH TRADE IN RUBBER GOODS.

Recently published returns of Irish trade during 1916 show that the imports of rubber goods totaled 2,978,752 pounds, value \$3,901,966, against 2,818,928 pounds, value \$3,076,156, in 1915. Gutta percha imports were 32,256 pounds, value \$14,434. There was a decrease in the figures for electric cables, which fell from 2,650,704 pounds, value \$2,275,610 in 1915, to 1,688,176 pounds, value \$1,754,497. Exports of rubber goods are given as having amounted to 1,506,240 pounds, value \$2,497,046. The quantity of electric cables exported was 173,376 pounds, value \$180,187.

ITALIAN ASSOCIATION OF MANUFACTURERS OF RUBBER, CABLES, ELECTRIC CONDUCTORS, ETC.

It is announced that on July 3, 1918, the above association was formed by fourteen Italian firms, which employ about 20,000 operatives and have an output valued at several hundred millions of lire per annum. (A lira = \$0.193, par.)

The object of the association is the development of the rubber and electric-conductor industries in Italy by the study of all questions affecting their expansion in Italy and abroad.

Senator G. B. Pirelli is the president, while the vice-presidents are Comm. Ing. V. Tedeschi, of the S. A. Ing. B. Tedeschi, of Turin, and Ing. Romolo Pola, of the Società Piemontese Industriale Gomma e Affini, of Moncalieri.

SUCCESS OF DANISH RECLAIMING COMPANY.

The "Berlingske Tidende," published at Copenhagen, Denmark, commenting on the expansion of the Dansk Afvulkaniserings-fabrik A/S, at Kjøge, states that these works employed only 10 men in 1908, but now employ over 200. It seems that this factory is the only one in Denmark going ahead at full capacity day and night, and it is claimed that the plant, due to a special method of devulcanizing, has supplied all the Swedish and Norwegian rubber factories during the war. Six tons of old galoshes have been imported per day.

SOVIETS NATIONALIZE RUSSIAN RUBBER INDUSTRY.

A Russian official dispatch has been received in London, announcing that all important industrial enterprises within the jurisdiction of the Soviet Government have been nationalized by a decree of the Government Council. Among the industries which are now in the hands of the Government are the rubber, metallurgical, textile, electrical, explosive, wood, tobacco, glass, and leather trades.

Municipal undertakings, whether in use or in the course of construction, will come under the provisions of the order.

RUBBER AND RUBBER GOODS FOR SWEDEN.

Under the terms of the new commercial treaty, recently signed by the Allies and Sweden, rubber and rubber goods, foodstuffs, and numerous other materials necessary for Sweden's economic life, are to be exported to Sweden by the Allies in return for 400,000 tons of deadweight shipping, 2,000,000 tons of iron ore, and other Swedish goods, on suitable credit terms during the continuance of the present unfavorable monetary exchange. This pact amounts to a virtual acceptance by Sweden of the Allied blockade, and is expected to diminish greatly the sending of supplies to Germany.

MICANITE MANUFACTURED IN SWEDEN.

John R. Rettig & Co., Stockholm, Sweden, has begun the manufacture of micanite, an electric insulating material consisting of mica cemented together under pressure with an india rubber compound. Before the war Sweden imported all micanite from Germany and England.

DUTCH FIRM CHANGES NAME.

Carel and Jacques Kan, Doetinchem, Netherlands, have taken over the business in rubber goods and allied articles from their father, who traded as Kan & Co. The firm will henceforth be known as Kan & Kan.

RUBBER IN GERMANY.

A correspondent of the "Times Trade Supplement" submits an interesting analysis of advertisements in the principal German newspapers during the first three months of this year.

In general, rubber appears to be seldom advertised, and then only in the form of rings for mineral water bottles. In January some offers of Pará rubber appeared in a dentist's paper, the price being about \$71.75 a pound. In April, an advertiser asked for: "One or two dozen new or second-hand tennis balls. High price given."

RUBBER SHORTAGE AFFECTS GERMAN GAS MASK SUPPLY.

Recent press dispatches from Edwin L. James, with the American Army in France, state that Germany is having trouble in supplying troops with gas masks because of the rubber shortage. Leather as a substitute for rubber in the face mask is unsatisfactory. Indeed, Germany is finding gas warfare a terrible boomerang.

GERMANY TO RECEIVE RUBBER FROM FINLAND.

An Amsterdam dispatch states that under a commercial agreement with Finland, Germany is to receive, among other much-needed materials, old stocks of rubber. Obviously, these stocks must be so small, however, that the German rubber shortage will remain relatively unchanged.

BOLIVIAN RUBBER TRADE CONDITIONS.

The British vice-consul at Riberalta, Bolivia, reports that on account of the depression in the rubber trade, the Beni district is passing through a crisis. It seems that the rubber year which ended March 31, 1918, was very unsatisfactory. Although in normal times prices would have afforded a margin of profit, under present circumstances they resulted in loss. Local quotations ranged from 60 cents to 64 cents per pound for fine rubber, and from 32 cents to 36 cents per pound for caucho. As a result of this acute situation, the largest firm of exporters of rubber from the Beni district recently received instructions from its London headquarters to withhold the balance of its export until more favorable times return.

During the quarter January-March, 1918, German firms appear to be continuing business under increased difficulties, their greatest handicap being the securing of sufficient supplies of clothing, foodstuffs, etc., for the workers on their rubber estates

Although the possession of quantities of old stock enabled the Germans to maintain themselves for some time, it appears from reports of the larger allied commercial houses here, that the financial position of enemy firms is now precarious.

As to the internal trade of Bolivia, which is receiving more attention because of restricted imports, this is at present controlled by a combination of German firms whose monopoly is practically complete in the territory through which the river Mamoré provides the means of communication.

A freight and passenger service has just been inaugurated, connecting Guajara Mirun, at the terminus of the Madeira-Mamoré railway, with the port of Santa Cruz, in opposition to the transport services provided by two German firms. It is believed that the new enterprise will help to break the German monopoly.

THE NETHERLANDS INDIES RUBBER GOODS FACTORY, BANDONG.

This enterprise was begun in March, 1917, and gradually expanded so that whereas only a few workmen were employed at the outset, their number was 80 at the end of the company's first year. Production increased proportionately, and a reasonable profit is expected for the coming year. A second and third series of shares were issued, amounting to about \$80,000, to finance necessary expansion and a good stock of supplies. The labor consists of natives who have shown themselves apt pupils, but rather prone to absent themselves from the factory as soon as they receive promotion.

THE SOUTH AFRICAN RUBBER MANUFACTURING & TYRE CO., LIMITED, IN NATAL.

The South African Rubber Manufacturing & Tyre Co., Limited, Johannesburg, maker of mechanical rubber goods, has ac-

PRESENT FACTORY OF THE SOUTH AFRICAN RUBBER MANUFACTURING & TYRE CO., LIMITED.

quired a large block of land adjoining the Howick Falls in Natal, together with the power rights, and will erect a rubber factory on the site. The height of the falls is 364 feet and they are at about two hours' railway journey from Durban.

SINGAPORE RUBBER FACTORY TO HAVE AMERICAN MACHINERY.

The Singapore Rubber Works (Nederlandsche Gutta-Percha Maatschappij), 95 Anna Pavlowa street, The Hague, Netherlands, is planning to purchase in America, rubber machinery, chemicals, and other supplies. J. P. M. Keuls, a representative of the company, is now in America for this purpose and will continue his trip to Soerabaya.

Recent Patents Relating to Rubber.

- N** 1,271,547. Shoe tree with inflatable sole. J. N. Delaney, Philadelphia, Pennsylvania.
 1,271,557. Joint for joining elastic tubes upon metal pipes. M. A. Meade, Little Falls, Pa.
 1,271,586. Spring wheel with rubber tread. J. Erdicki, Rayland, Ohio.

THE UNITED STATES.

ISSUED JULY 9, 1918.

- 1,271,707. Combination rubber and leather footwear. E. Heiser and P. Bindler, Berlin, Ontario, Canada, assignors to The Good-year's Metallic Rubber Shoe Co., Naugatuck, Connecticut.
 1,271,826. Stamping device with elastic printing disk. E. E. Anderson, Brooklyn, New York.
 1,271,843. Method of manufacturing rubber footwear. C. F. Bradley, assignor to Mishawaka Woolen Manufacturing Co., both of Mishawaka, Indiana.
 1,271,880. Tire and method of manufacture. G. F. Fisher, Roselle, New Jersey, assignor to The Hartford Rubber Works Co., Hartford, Connecticut.
 1,271,936. Wheel with demountable rim. L. H. Perlman, New York City.
 1,271,957. Tread band for pneumatic tires. W. F. Sprengnether, St. Louis, Missouri.
 1,271,985. Tire carcass construction. A. O. Abbott, Jr., assignor of one-half to W. B. Norton, both of Detroit, Michigan.
 1,272,058. Suspension patch for balloons. H. T. Kraft, assignor to The Goodyear Tire & Rubber Co.—both of Akron, Ohio.
 1,272,098. Boot or shoe heel with rubber insert. J. P. Kelly, St. Louis, Missouri.
 1,272,122. Vehicle wheel with pneumatic tubes. G. Schadee, assignor by mesne assignments, of two-thirds to E. G. Gallagher and one-third to A. Schadee—all of New York City.
 1,272,134. Tire armor having layers of vulcanized fabric combined with wire fabric.
 1,272,143. Heel-protector for rubber heel. T. H. Sullivan, Sidney, Ohio.
 1,272,161. Cushioned wheel. P. L. White, McCormick, South Carolina.
 1,272,162. Hide and leather-working machine having reciprocating bladed bar with blades combined with rubber. R. F. Whitney, assignor to Whitney Machine Co.—both of Winchester, Massachusetts.
 1,272,213. Demountable rim for tires. E. P. Calvin, Sardinia, Ohio.
 1,272,215. Spring tire. C. A. Chalont, Aberdeen, Maryland.
 1,272,223. Arch-supporting shoe with inflatable cushion between middle and inner soles. T. Coffey, West Tulsa, Oklahoma.
 1,272,241. Spinning box having hard-rubber body. C. A. Ernst, assignor to The Viscose Co.—both of Marcus Hook, Pennsylvania.
 1,272,247. Jar for submarine and other batteries. B. Ford, Philadelphia, Pennsylvania.
 1,272,300. Resilient wheel. M. A. Meyers, Kane, Pennsylvania, assignor of 99/100 to 52 different assignees, names only given, without addresses.
 1,272,309. Aviator's helmet with expandible head-band and having front section and chin-pad adjustable by means of elastic straps. J. Paupa, assignor to Thos. E. Wilson & Co.—all of Chicago, Illinois.
 1,272,329. Pneumatic abdominal support. R. S. Carling, Los Angeles, California.
 1,272,332. Electrothermal garment having three plies detachable from each other for cleansing purposes. B. R. and P. E. Charles, Victorville, California.
 1,272,333. Aerial mine having fuse-bomb-containing gas-bag, etc. R. J. Daly, Philadelphia, Pennsylvania.
 1,272,342. Demountable rim for tires. O. Oneal, Fremont, Michigan.

ISSUED JULY 16, 1918.

- 1,272,351. Emergency auto tire. C. W. Albrecht, Jr., Schleiserville, Wisconsin.
 1,272,429. Waistband with elastic webbing insert. M. L. Heller, Brooklyn, New York.
 1,272,467. Demountable rim for tires. B. B. Leustig, Cleveland, Ohio.
 1,272,476. Tire of carcass construction having continuous coiled spring within. F. H. Lopez, Cumming, California.
 1,272,576. Resilient tire. L. P. Thompson, Minneapolis, Minnesota.
 1,272,577. Truss. J. I. Throckmorton, Clarksburg, Ohio.
 1,272,602. Resilient wheel. S. C. Barr, Chillicothe, Ohio.
 1,272,619. Yieldable tire filling. J. G. Campau, assignor of one-fourth to C. C. Groff—both of Monroe, Michigan.
 1,272,664. Tire with rounded central tread portion for carrying load when inner tube is inflated, and auxiliary treads for carrying it when inner tube is deflated. J. W. Hummel and F. W. Uhde—both of Philadelphia, Pennsylvania.
 1,272,684. Dress shield and process of manufacture. R. Levi, New York City.
 1,272,697. Fountain pen with compressible reservoir. F. H. Mooney, assignor to The Conklin Pen Manufacturing Co., Toledo, Ohio.
 1,272,706. Union garment having elastic suspender inserted in the back. G. W. Pease, Pittsfield, Massachusetts.
 1,272,731. Fountain pen. H. J. Upton, Medford, Massachusetts.

- 1,272,747. Combined car heater, stove, etc., medicine-holder, having inflatable cushion for a seat. H. E. Wegman and R. A. Phelan, both of St. Louis, Missouri.
 1,272,852. Spring wheel. W. H. Johnson, assignor to G. H. Brown—both of Brooklyn, New York.
 1,272,920. Tire supporting rim for vehicle wheels. M. Cowley, Tuckerton, New Jersey.
 1,273,022. Tire core. D. A. Clark and C. F. Lowe, both of East Cleveland, assignors to The Ohio Tire Co., Cleveland—all in Ohio.
 1,273,046. Tire tread construction. H. W. Dyer, East Orange, New Jersey. (Continuation in part of previous application.)

ISSUED JULY 23, 1918.

- 1,273,124. Tire repair vulcanizer. C. W. and W. J. Alter—both of Hagerman, New Mexico.
 1,273,135. Tire shoe. G. Bergkvist, Mosquito, New Mexico.
 1,273,175. Resilient shoe heel. E. A. Nolan, St. Paul, Minnesota. (Original application divided.)
 1,273,446. Protective liner for pneumatic tires. R. L. Belton, Dayton, Ohio.
 1,273,549. Hydroaeroplane. T. Sloper, Devizes, England.
 1,273,550. Supporting device. H. Stamp, Philadelphia, Pennsylvania.
 1,273,553. Parachute. R. H. Upson, assignor to The Goodyear Tire & Rubber Co.—both of Akron, Ohio.
 1,273,640. Demountable rim for tires. R. McLure, assignor to H. G. Farms, both of Gilman, Montana.
 1,273,670. Carriage-feeding belt for machine guns, having warp of rubber threads. J. G. C. Quinon and L. Courbon, St. Etienne, France.
 1,273,687. Life-preserver with inflatable sacks. F. Stebbing, Washington, District of Columbia.
 1,273,731. Pad for horse's heel and shoe, with lower rubber tread portion and an upper composite rubber and woven fabric top. E. R. Button, assignor of one-half to G. W. Dunn—both of Scranton, Pennsylvania.
 1,273,739. Corset with elastic abdominal sections. L. A. Cirillo, New York City.
 1,273,792. Protective tread-covering for tires. J. Laube, Deer Island, Oregon.

ISSUED JULY 30, 1918.

- 1,273,813. Pneumatic spring system for vehicles, including air-container. R. Bernat, Bordeaux, France.
 1,273,964. Pneumatic automobile tire. H. A. Webb, Hamden, Conn.
 1,274,174. Hollow rubber article and method of manufacture. J. J. Lee, Brooklyn, assignor to A. Behrend and J. Rothschild, co-partners as Behrend & Rothschild, New York City—all of New York.
 1,274,237. Tire and means of attachment. J. Boryszewski, Forks, N. Y.
 1,274,437. Stepper for hot-water bottles, etc. E. V. Myers, East Orange, N. J., assignor to A. Schrader's Son, Inc., Brooklyn, N. Y.
 1,274,445. Window washer and wiper. J. G. Randall, assignor of one-half to J. T. Shepherd—both of Dallas, Tex.
 1,274,457. Rubber reducing-corse. G. E. Schenck, East Rutherford, N. J., assignor to C. M. Davis, New York City.
 1,274,734. Revolving rubber heel with means for attachment. V. F. Maliszewski, Detroit, Mich.
 1,274,853. Rubber heel. F. S. Carr, Newton, Mass.
 1,274,883. Combined pneumatic and cushion tire. L. Hofmeister, Milwaukee, Wis.
 1,274,892. Abdominal belt. A. B. Kendrick, East Orange, N. J., assignor of one-half to J. R. Kendrick Co., Inc., Philadelphia, Pa.
 1,274,922. Tap sole of combined vulcanized fiber, leather, and rubber. F. Marsh, Lewis, assignor of one-third to W. Hey and one-third to J. W. Meador—both of York, Pa. all in England.
 1,274,983. Windshield cleaner. C. A. Bridgwood, Westwood, N. J.
 1,275,005. Webbed swimming glove. J. W. Eckman, Decatur, Ill.
 1,275,033. Pneumatic tire valve. W. C. Huntoon, Providence, R. I.
 1,275,069. Toe-box insert. C. Mikkelsen, Beloit, Wis.
 1,275,109. Vehicle-wheel rim. J. H. Wagonmire, Akron, O., assignor to The B. F. Goodrich Co., New York City.

ISSUED AUGUST 13, 1918.

- 1,275,199. Tire-tread protector. C. W. Bain, Norfolk, Va.
 1,275,306. Inflatable pneumatic support for stretchers and beds. M. W. Rosenshine, San Francisco, Cal.
 1,275,416. Tire valve control. W. S. Gendey, Belleville, N. J.
 1,275,523. Pneumatic fabric tire and process of manufacture. F. C. Bragg, Springfield, Mass.
 1,275,590. Dental plate. W. M. Norwood, Greenville, S. C.
 1,275,633. Tire protector. G. B. Waite, New York City.
 1,275,643. Pneumatic tire shoe. G. B. Waite, New York City.
 1,275,647. Inflatable life-belt. S. P. Bjerre, Chicago, Ill.
 1,275,727. Pneumatic water-skate. M. Nies, assignor of one-half to J. Kolyazki—both of St. Catharines, Ontario, Canada.
 1,275,746. Airship with gas-containing envelope. J. E. J. Rainey, Dallas, Tex.

THE DOMINION OF CANADA.

ISSUED MAY 31, 1918.

- 184,129. Tire with resilient core. O. J. Hicks, Centerburg, O., U. S. A.
 184,137. Armored pneumatic tire. I. L. Leo, Toronto, Ont.
 184,139. Tire. J. Lorenz, Milwaukee, Wis., U. S. A.
 184,140. Shoulder brace. H. V. A. Loring, Chicago, Ill., U. S. A.
 184,141. Tire. F. Lotter, Elkton, Mich., U. S. A.
 184,145. Cushion for wheels. C. S. Martin, Washington, D. C., U. S. A.
 184,186. Tire rim. H. Stinemetts, Calgary, Alta.
 184,222. Liner for pneumatic tires. The Dunlop Tire and Rubber Goods Co., Limited, assignee of T. A. Burns—both of Toronto, Ont.
 184,228. Vulcanizable tire patch. The Marvel Accessories Manufacturing Co. assignee of S. I. Rose—both of Cleveland, O., U. S. A.
 184,440. Resilient tire. O. A. Kondelke, Cicero, Ill., U. S. A.
 184,518. Inner tube. S. Johnstone and W. E. Doran, co-inventors—both of St. Catharines, Ont.
 184,589. Pneumatic wheel. W. T. Newman, Vancouver, B. C.
 184,597. Waterproof stocking with integral vulcanized rubber interlining. A. Richard, Hamilton, Ont.

THE UNITED KINGDOM.

ISSUED JULY 17, 1918.

- 115,748. Diver's dress with rubber collar securing helmet to dress. R. H. Davis, 187 Westminster Bridge Road, London.
 115,756. Webbing glove for swimming. J. A. and E. A. E. H. Haldsworth—both of 24 St. Ann's Villas, Holland Park, Kensington, London.
 115,770. Six-toe stiffener for boots, etc., of woven wire fabric embedded in rubber compound. J. H. Ordway, 77 Fuller street, Brookline, Massachusetts, U. S. A.
 115,784. Boot-sole with backing of rubber, rubberoid, etc. W. V. Brierley, Park Dale, New Hereford Dunlop Tyre and Rubber, Monmouthshire.
 115,788. Sole or heel protector of raised rubber on canvas backing. F. J. Wood, 3 Raws street, Bank Parade, Burnley, Lancashire.
 115,841. Bicycle saddle with inflatable cushions. A. P. van Leuven, 41 Frankenslag, The Hague.
 115,912. Protected motor for cars, "tanks," aircraft, motorboats, etc., composed of coil fiber fabric and rubber, or balata vulcanized together. Coir Tyre Co., 56A Mosley street, and G. D. Rose, 14 Albert Park Road, Lower Broughton, Salford—both in Manchester.
 115,913. Fabric for driving belts, composed of layers of fabric and rubber. E. B. Boughten, Gleniffer, Doldington Road, Swallowback, Lincoln.
 115,914. Demountable rim for tires. J. J. Foley, 46 Kearny street, San Francisco, California, U. S. A.

ISSUED JULY 24, 1918.

- 115,945. Tire cover with gable-shaped tread. E. B. Killen, 27 Queen Victoria street, London.
 115,955. Elastic hand for securing wearing apparel. W. Lee, 36 Haymerle Road, Peckham, London.
 115,990. India rubber driving belts. W. M. Angus, St. John's Works, Newcastle-on-Tyne, and G. Lunney, Ingleborough View, Benham.
 115,993. Surgical appliances. E. Roddy, 108 West 61st street, New York City.
 116,001. Rubber-tired wheel for children's go-carts. W. H. Ball, 12 Terrace street, Hyson Green, Nottingham.
 116,014. Corsets with back lacing covered by elastic strip. M. Shaw, 1412 East 55th street, Chicago, Illinois, U. S. A.
 116,057. Artificial hands with rubber fingers stiffened with wire. J. J. Stubbs, City Road, Cardiff.
 116,079. Rectal syringe. H. Cottonnet, Avenue de la République, Aubervilliers, France.
 116,081. Sole for boots and shoes, having layers of vulcanized wood fiber, etc., with fabric backing secured to them by rubber solution. Société Française du Caoutchouc, 57 rue Alexandre Dumas, Paris.
 116,087. Oxygen-administering apparatus with rubber bags. L. Durieu, 18 Boulevard des Brotteaux, Lyons, France.
 116,093. Spring wheels with cover of balata, etc. A. Andersen, 4 Rosenkrantzsgade, Copenhagen, Denmark.
 116,127. Veil with elastic gathering thread at edge. A. Burnet, 6 Well street, Jewin street, London.
 116,155. Soothing teats. J. H. Davis, 194 Bristol Road, Birmingham.

ISSUED JULY 31, 1918.

- 116,191. Rubber tapping knife. Guthrie & Co., 5 Whittington avenue, Leadenhall street, London. (H. J. V. Duncan, Port Dickson, Negri Sembilan, Federated Malay States).
 116,351. Surgical injection apparatus. M. Day, 8 Albemarle street, Clerkenwell, London.
 116,376. Respirators. F. E. Jackson, 22 Beech Road, Chorlton-cum-Hardy, Manchester.
 116,382. Apparatus for administering anesthetics. E. V. Toney, 134 Birchfield Road, Handsworth, Birmingham.
 116,390. Cushion tire. E. B. Killen, 27 Queen Victoria street, London.
 116,405. Sole for boots and shoes, composed of layers of damp-proof wood, vulcanized fiber, etc., glued together. C. A. Schleinger and A. Metzler—both of Wohlen, Aargau, Switzerland.

ISSUED AUGUST 8, 1918.

- 116,424. Breathing apparatus for divers. H. Wade, 111 Hatton Garden, London. (Drägerwerk H. & B. Dräger, 53 Moissinger Allee, Lubek, Germany).
 116,448. Pneumatic tire-pressure gauge. J. M. Gowers, 801 Sutter street, San Francisco, Cal., U. S. A.
 116,534. Parachutes contained in flexible envelope. E. R. Calthrop, Eldon Street House, Eldon street, London.

- 116,607. Rubber solution container for tire-repair outfits. Dunlop Rubber Co., 14 Regent street, Westminster, and H. J. Dunn, 47 Kingsbury Road, Gravely Hill, Birmingham.
 116,615. Waterproof cover for ladies' hats. W. D. L. Bushy, School House, Clifton-upon-Dunsmore, Warwickshire.
 116,632. Revolvable rubber pad for heels, soles, and tips. T. C. Redfern, G. W. Richards, and Redfern's Rubber Works, Limited, Dawson street, Hyde, Cheshire.
 116,627. Means for attaching rubber tires to rims. W. T. G. Ellis, C. O. R. McLeod, 15 Cambridge street, Glasgow.

ISSUED AUGUST 14, 1918.

- 116,726. Hypodermic injector with rubber piston plug. R. G. J. McEntee, 23 Pembroke Park, Dublin.
 116,733. Suction appliances in dentures. S. J. Everett and A. Kirkman, Oakleigh, Duppas Hill Road, Croydon, Surrey, and H. O. Cottrell, 15 Charlotte street, London.
 116,798. Stepper for carbony, with rubber washer. British Dyes, Limited, and J. Turner, Turnbridge Chemical Works, J. Bruce, Wood Villa, Berry Brow, and J. D. Eastwood, 16 Batley avenue, Marsh—all in Huddersfield, Yorkshire.
 116,812. Rubberized fabric container for transporting and storing gas. A. C. Spencer, E. Allen, and E. G. Cole, 56A Highbury Grove, London.
 116,813. Blotting appliance with holding device of rubber. E. Howarth, Spring Field, Midgley, Luddenden Foot, Yorkshire.
 116,818. Flanged rubber sole for boots, etc. A. Dales, trading as A. Dales & Co., India Rubber Mills, Blake street, Stratford Road, Manchester.
 116,836. Hose coupling. F. Reddaway & Co. and J. Muskett, Cheltenham street, Fendleton, Manchester.

ISSUED AUGUST 21, 1918.

- 116,850. Boot-sole protector. F. J. Wood, 3 Raws street, Bank Parade, Burnley, Lancashire.
 116,872. Valve for feeding bottles. A. Jackson, Woodleigh, Temple Gardens, Golder's Green, London.
 116,913. Improvement in valve for rubber bag in straw-hat presses. A. H. Mosley and C. Macintosh & Co., Cambridge street, Manchester.
 116,975. Elastic cords for muscle exercisers. H. J. Wareham, 146 Blackfriars Road, London.
 116,986. Rubber-covered stoppers for vacuum flasks. A. W. Brunette, Golconda, Upper Court Road, Epsom, Surrey, and C. C. Seabrook, 15 Took's Court, Curstow street, London.
 117,012. One-piece life-saving suit. P. Borgan, 1014 Hawthorne avenue, Portland, Ore., U. S. A.

ISSUED AUGUST 28, 1918.

- 117,063. Rubberized fabric container for transporting and storing gas. A. C. Spencer, E. Allen, and E. G. Cole, 56A Highbury Grove, London. (See patent No. 116,812).
 117,093. Tire tread. T. Dunn, 63 Tierney Road, Streatham Hill, London.
 117,102. Eyelid retractor. H. Shanker, Civil Hospital, Delhi.
 117,119. Rubberized canvas aircraft cushioning device. T. Sloper, Southgate, Devizes, Wiltshire.
 117,133. Dental articulators with rubber-shod jaws. A. W. Fisher, Bryn Estyn, Whitechurch, Shropshire.
 117,148. Respiration modifier. J. Baer, 80 Holland Park, London. (P. Lassabiere, St. Hilaire, St. Mesmin, Loiret, France).
 117,177. Inner-tube liner. I. B. Jeffries, trading as I. Benjamin, 3 John street, Llanelli, Carmarthenshire.

THE FRENCH REPUBLIC.

- PATENTS ISSUED (WITH DATES OF APPLICATION).
 486,768. (October 23, 1916.) Improvements in abdominal supporters such as corsets. F. G. Auguste.
 486,809. (September 7, 1917.) Jute Life Belt Manufacturing Co.
 486,824. (September 14, 1917.) Life-saving vest. H. L. Ziman.
 486,886. (September 19, 1917.) Improvements in vehicle wheels. H. Allen.
 486,925. (September 23, 1917.) Improvements in tires. G. A. Mortier.
 486,944. (December 9, 1914.) Improvements in wheels having inner pneumatic tires. J. Goussier, 1 rue de la Demiportière.
 487,044. (October 4, 1917.) Pneumatic tire protector. J. F. Bioletto.
 487,085. (October 8, 1917.) Wheel rims and tires. H. Rajlowich.
 487,096. (October 10, 1917.) Ball valve of rubber or other elastic substance. M. S. Reiley.
 487,137. (October 12, 1917.) Pneumatic hub for vehicle wheels. H. Schade van Westrum.

NEW ZEALAND.

- ISSUED JULY 11, 1918.
 38,792. Indoor game. J. S. Wearn, Christchurch.
 40,033. Combined grid and rubber packing for tubular connections. I. Fraser, "Arnprior," Rangers Road, Neutral Bay, and E. L. Ernest, Maromaba, Nelson street, Woolahra—both of Sydney, New South Wales.
 40,055. Rubber pad attaching device for horseshoe. R. P. Gray, Ellangowan, Bishop's Road, Sutton Coldfield, Warwick, England.

TRADE MARKS.

THE UNITED STATES.

- NO. 101,452. The word HAWK—golf balls. North British Rubber Co., Limited, Edinburgh, Scotland.
 107,788. Representation of a tire in ellipse with two parallel white stripes on tread portion—tire covers. Gates Manufacturing Co., Indianapolis, Ind.

- 110,118. The words **PYE-MUSSINIA** with a representation of two crossed bayonets at each end and an oblong blank white space superimposed above the middle of the word—rubber or rubber and fabric pneumatic vehicle tires.
- 110,213. The words **JIFFY-ATL**—waterproof fabrics for protecting inner garments, etc. Jiffy-All Corp., New York City.
- 110,462. The word **ALCOA**, rubber lined cotton fabric hose. American La France Fire Engine Co., Inc., Elmira, N. Y.
- 110,463. The word **ALCOA**—respirating devices. American La France Fire Engine Co., Inc., Elmira, N. Y.
- 110,471. The word **DECO**—rubber rings for fruit jars. The Deis-Fertig Co., Dover, O.
- 110,592. Representation of a negro running, with a turtle biting one heel, a fishing pond in the background, and the slogan underneath, "Work hard, fish for thunder"; above all, the words **TURTLE GRIP**—patches for repairing inner tubes of all kinds. Southern Turtle-Grip Co., Houston, Tex.
- 110,598. Representation of a patched pant leg, with a staff—rubber and composition hose, and rubber, leather, and composition belting and packing. Geo. B. Carpenter & Co., Chicago, Ill.
- 110,635. The word **CONQUEROR**—rubber hose and hose made of composition rubber or rubber and fabric. Voochers Rubber Manufacturing Co., Jersey City, N. J.
- 110,654. The word **VACU**—tire patches and reinforcers. J. H. and G. L. Atwood, Inc., Boston, Mass.
- 110,815. The words **DUO-TEX** in script letters arranged in a semi-circle—leather or fabric belts for personal wear. Live Leather Belt Co., Inc., New York City.
- 110,867. The words **WIX**—rubber boots and shoes of leather, fabric, and rubber, combined. Beacon Falls Rubber Shoe Co., Beacon Falls, Conn.
- 110,916. The word **POLAR**—zinc oxide used as a filler for rubber goods. The American Metal Company, Inc., New York City.
- 111,061. The word **BANNER**—rubber and composition hose and rubber, leather, and composition belting and packing. Geo. B. Carpenter & Co., Chicago, Ill.
- 111,232. Representation of a shield upon which is superimposed a double outlined triangle with a pair of scales within and the letters G and H to the right and left of the apex—rubber boots and shoes, etc. Von Der Heyde & John, New York City.
- 111,234. Representation of a shield upon which is superimposed a double outlined triangle with a pair of scales within and the letters G and H to the right and left of the apex—rubber coats and various other articles of wearing apparel. Von Der Heyde & John, New York City.
- 111,289. The word **INKTAP**—fountain pens. Adams, Cushing & Foster, Inc., Boston, Mass.
- 111,290. The word **ACFAD** enclosed within a modified ellipse suggesting the outline of a bathing cap—rubber erasers, rubber bands, fountain pens, etc. Adams, Cushing & Foster, Inc., Boston, Mass.
- 111,293. Silhouette of Ajax rolling a tire—rubber gums, namely: combination, combination tube, cushion, and tread. Ajax Rubber Co., Inc., Millbrook, N. Y.
- 111,294. Silhouette of Ajax rolling a tire—vulcanizing cement and air-driving pure-rubber patching cement. Ajax Rubber Co., Inc., Millbrook, N. Y.
- 111,325. The word **VICTOR**—golf balls. Wright & Ditson, Boston, Mass.
- 111,370. The word **TREO**—puncture-sealing preparation for pneumatic tires. Tubo Manufacturing Co., Saint Louis, Mo.
- 111,688. The word **ACU**—fibrous heels and soles. The Ace Rubber Heel & Sole Co., Elkhart, Ind.

THE DOMINION OF CANADA.

- 25,515. The word **ADMYA**—garters, etc. Wagner & Brandon, 54 Alderbury, London, E. C.
- 25,543. The word **GOODYEAR**—vulcanizate and solid tires, pneumatic tubes, tire accessories, hose, belting, packing, tubing, molded goods, cements, leather substitutes, rubber or composition heels and soles. The Goodyear Tire and Rubber Co. of Canada, Limited, Toronto, Ont.
- 25,545. The word **COOLASTIC**—bandages. Everlastik, Inc., Boston, Mass., U. S. A.
- 25,567. Representation of a geometric figure—rubber tires. The Brunswick-Balke-Clender Co., Chicago, Ill., U. S. A.

ARMY AND NAVY AWARDS.

GENERAL ENGINEER DEPOT AWARDS.

THE following awards of mechanical rubber goods have been announced at the general engineer depot, United States army.

CORD, PACKING-HOUSE.—\$39, The B. F. Goodrich Rubber Co.

GASKETS, RUBBER.—6,000 pounds, \$0.25, Quaker City Rubber Co., Philadelphia, Pennsylvania.

PACKING.—Asbestos sheet: 2,000 pounds, \$0.75, Manhattan Rubber Manufacturing Co., Passaic, New Jersey.

SHEETS, RUBBER.—75 pounds, \$0.80, The B. F. Goodrich Rubber Co., Akron, Ohio.

FIELD MEDICAL SUPPLY AWARDS.

The following awards of rubber sundries have been made by the field medical supply depot, Washington, District of Columbia.

APRONS.—35,000, \$0.55¼ each, L. C. Chase Co.

ATOMIZERS, HAND.—3,500, \$0.82 each, De Vilbiss Manufacturing Co.

BANDS, ELASTIC, PURE GUM.—5,000 gross, \$0.16, The B. F. Goodrich Rubber Co.

BASINS.—25,000, \$0.55 each, United States Rubber Co.

BULBS.—20,000, \$0.0105 each, Tyer Rubber Co.

GLOVES.—8,000 pairs, \$0.25, Miller Rubber Co.

POUCHES FOR RUBBER GLOVES.—7,000, \$0.15 each, L. C. Chase Co.

STOPPERS.—250,000, \$0.52 per pound, F. A. Cigol Rubber Co.

SPRINGS. Hard rubber, 8,350, \$0.20 each, Charles Schmid Co.; 20,000, \$0.30 each, Tyer Rubber Co.; rectal, 10,000, \$0.94 each, American Hard Rubber Co.

TOURNIQUETS AND BANDAGES.—2,500, \$0.75 each, Parker, Sigbee & Co.

TUBES, STOMACH.—3,000, \$0.54 each, The B. F. Goodrich Rubber Co.

NAVAL SUPPLY AWARDS.

The following awards have been made for furnishing rubber goods for navy yards:

FERRULES, RUBBER.—135,000, \$4,156.65, Ohio Rubber Co., Cleveland, Ohio.

GASKETS.—Strip and sheet gum, \$103,278.20; 13,000 pounds, \$5,722, Hewitt Rubber Co., Buffalo, New York; molded rubber: 8,000 pounds, \$4.40; 300 pounds, \$183, New Jersey Car Spring & Rubber Co., Inc., Jersey City, New Jersey.

HOSE.—Rubber, steam, 3,000 feet, \$1,335, Hamilton Rubber Co., Trenton, New Jersey; rubber, wash deck, 40,000 feet, \$0.529, Hewitt Rubber Co., Buffalo, New York.

PACKING.—Compressed fiber sheet, 100,000 pounds, \$42,000; 16,000 pounds, \$6,720, The B. F. Goodrich Rubber Co., Akron, Ohio.

WIRE, RUBBER-COVERED.—21,000 feet, \$343.35, American Steel & Wire Co., Chicago, Illinois, and \$504.20, Bourn Rubber Co., Providence, Rhode Island.

NAVY EMERGENCY PURCHASES.

The following awards have been made by the bureau of supplies and accounts, Navy Department, for Navy emergency purchases:

BALLOONS, RED RUBBER.—115, \$37.50, Faultless Rubber Co., Ashland, Ohio.

CONDUCTORS, TWIN FLAT.—15,000 feet, \$9,675, Boston Insulated Wire & Cable Co., Epping, New Hampshire.

MANOMETERS.—20, \$345, Goodyear Tire & Rubber Co.

PARACHUTES, BASKET TYPE.—2, \$630, Goodyear Tire & Rubber Co., Akron, Ohio.

VALVES, GAS.—One 16-inch, \$123.70, Goodyear Tire & Rubber Co., Akron, Ohio.

PANAMA CANAL AWARDS.

The following awards have been made for furnishing supplies for the Panama Canal:

HOSE, WATER. 500 feet, \$292.50, Hamilton Rubber Co., Trenton, New Jersey.

TIRES.—30, \$1,947.46, Goodyear Tire & Rubber Co., Akron, Ohio; \$606.40, Century-Plainfield Tire Co., Plainfield, New Jersey.

CENSUS AND CONTROL OF THE PLANTATION RUBBER INDUSTRY.

THE August, 1918, issue of "The Times Trade Supplement," publishes an article by J. S. M. Rennie, which emphasizes the need for a compulsory census of all rubber plantations controlled by British subjects. The writer urges that the collecting of such statistical data is necessary in order that some controlling authority "should be in a position in times of stress and possible overproduction, so to control outputs as to prevent a cllapse in the price of the commodity and the opportunity which any

such crisis would offer to powerful cliques (probably 'alien') to buy up a controlling interest."

Since no visible move has been made by the authorities to collect such figures, the writer has compiled from all the available hand-books from the various rubber-producing centers the following tables showing the location and domicile of all the known rubber plantations:

DOMICILED IN UNITED KINGDOM.

Location.	Acres.
Federated Malay States.....	586,883
Straits Settlements.....	109,500
Ceylon.....	179,695
South India.....	41,820
British Borneo.....	29,880
British Burma.....	24,620
South Sea Islands.....	5,000
Sumatra.....	98,000
Java.....	108,830
Dutch Borneo.....	5,100
	1,189,338

DOMICILED IN STRAITS SETTLEMENTS.

Location.	Acres.
Federated Malay States.....	20,270
Straits Settlements.....	40,000
Burma.....	1,770
Sumatra.....	6,055
Straits Settlements (private owners).....	10,000
Federated Malay States (private owners).....	20,000
	98,095

DOMICILED IN FEDERATED MALAY STATES.

Location.	Acres.
Federated Malay States.....	13,348
Federated Malay States (private owners).....	105,000
	118,348

DOMICILED IN CEYLON.

Location.	Acres.
Ceylon.....	40,000
Ceylon (private).....	10,000
Federated Malay States.....	7,000
	57,000

DOMICILED IN SHANGHAI (BRITISH).

Location.	Acres.
Federated Malay States.....	30,000

DOMICILED IN HOLLAND AND NETHERLANDS EAST INDIES.

Location.	Acres.
Federated Malay States.....	5,000
Sumatra.....	120,000
Java.....	100,000
Sumatra (private).....	10,000
Java (private).....	20,000
Dutch Borneo.....	5,000
	260,000

DOMICILED IN FRANCE AND BELGIUM.

Location.	Acres.
Federated Malay States.....	20,000
Sumatra.....	60,000
Java.....	10,000
Cochin China.....	10,000
	100,000

DOMICILED IN UNITED STATES OF AMERICA.

Location.	Acres.
Sumatra.....	35,000

DOMICILED IN GERMANY.

Location.	Acres.
Sumatra.....	3,490

Total planted area.....1,911,171

According to domicile, therefore, the percentage controlled by the different nationalities may be summed up as follows:

	Acres.	Per Cent.
British Domicile.....	1,492,771	or 79
Dutch Domicile.....	260,000	or 13½
French and Belgian Domicile.....	100,000	or 5¼
United States of America Domicile.....	35,000	or 2½
German Domicile.....	3,490	or ¼
Totals.....	1,911,171	100

But if the place where planted is considered, the control is vested as follows:

BRITISH.

Location.	Acres.
Federated Malay States and Johore.....	807,491
Straits Settlements.....	159,500
Ceylon.....	229,695
South India.....	41,820
British Borneo.....	29,880
British Burma.....	24,620
	1,492,006

South Sea Islands.....	5,000
	1,299,786
	(or 67 per cent)

DUTCH AND OTHERS.

Location.	Acres.
Sumatra.....	352,435
Java.....	238,530
Dutch Borneo.....	10,100
Cochin China.....	10,000
	611,385
	(or 33 per cent)

When domicile and location are combined, the result is:

Location.	Acres.
British Empire.....	1,517,771 or say 80 per cent
Dutch and others.....	393,400 or say 20 per cent
	1,911,171

Calculating that this area will yield an annual crop of 380,000 tons of rubber about 1920, the distribution will be as follows:

BASED ON DOMICILE.

Location.	Tons
British Empire.....	281,000
Dutch Empire.....	75,000
France and Belgium.....	15,000
United States of America.....	8,000
Germany.....	1,000
	380,000

BASED ON ESTATE LOCATION.

Location.	Tons
British Empire.....	255,000
Dutch East Indies, etc.....	125,000
	380,000

BASED ON DOMICILE AND ANY LOCATION COMBINED.

Location.	Tons.
British.....	290,000
Dutch and others.....	90,000
	380,000

Unless some control is exercised, it is pointed out that enemy and neutral countries, will be able to obtain about 15 per cent of the estimated crop for 1920, if peace has ensued by that time, at the same price per pound as the United Kingdom and the Allies.

Furthermore, says the writer, if conditions permit plantation companies and the powerful American and British rubber goods manufacturers to plant *ad libitum*, the planted area ten years hence may easily be 4,200,000 acres, which at 375 pounds per acre per annum would give a total crop of 700,000 tons. And in the event that the demand is less by the smallest fraction than the supply, a serious drop in prices is foreseen, accompanied by an equally considerable fall in the market value of an acre of rubber. This circumstance would give a powerful clique backed by the large American, British, and French manufacturers, the chance to buy up control of the great bulk of plantation companies, and to regulate prices so that members of the trust would be able to undersell all manufacturers outside the clique.

ADVOCATE MINIMUM RUBBER PRICES.

The rubber planters of the Dutch East Indies have just started a campaign to secure the fixing of minimum prices for rubber and the licensing of its export. They also seek official assistance in an attempt to secure the cooperation of the planters in Ceylon and the Malay States. But while these efforts are being made in Java, the Selangor branch of the Federated Malay States Chamber of Commerce is launching a movement for the total exclusion from the Singapore market of rubber produced in the Dutch East Indies, during the war, or, if prohibition is impossible, for a special import tax of five per cent. It seems to be felt that the American Government should do nothing to assist the import of Dutch rubber to the detriment of Allied producers. The Planters' Association of Malaya has asked the British Government to induce other rubber-producing countries to limit their output, and it is pointed out that the British War Cabinet has adopted the principle of preferential trade within the Empire.

Review of the Crude Rubber Market.

Copyright, 1918.

NEW YORK.

CRUDE rubber imports for October, November and December have been fixed at 25,000 tons and will be allocated to rubber manufacturers according to the program promulgated September 22, by the War Trade Board, and published elsewhere in this issue.

PLANTATIONS.—Quiet market conditions have prevailed in this market during the past month, as consumers were generally satisfied with small lots sufficient for immediate requirements, and are awaiting new developments. Interest was lacking to a great extent in either stock afloat or for future shipment, and the scarcity of allocation certificates indicated that manufacturers were supplied.

About the middle of the past month considerable free rubber was offered by manufacturers who were overstocked, and sales of small lots were reported to have been made at prices ranging from 51 to 61 cents for Crêpe and 49½ to 60 for Ribbs. Trading in allocation certificates was an unusual feature of the market.

The Far Eastern market received considerable attention from the manufacturers, relieving in a measure the distressed condition in that quarter. Quotations on October and November shipments of Crêpe varied from 35 to 40 cents, and on Ribbs from 33½ to 38 cents during the month.

PARAS.—Upriver fine, for future shipment was quoted at 57½ to 60 cents, and coarse sold for 30½ to 31 cents. Upper cauchó ball was placed at 30½ cents, and Cametá sold for 21 cents. A few lots of free Upriver fine were sold at maximum prices.

STATISTICS.—The United States plantation imports for August, 1918, were 15,153 tons, compared with 8,473 tons for the same month a year ago. Pará imports for August, 1918, were 1,760 tons, compared with 1,744 tons last year.

NEW YORK SPOT QUOTATIONS.

Following are the New York spot quotations, one year ago, one month ago, and September 28. Government option prices, c. i. f. New York are given in the last two columns.

RECLAIMED RUBBER.

While more active interest in reclaimed rubber was noted during the past month, the movement has not had any appreciable effect on the market. Now that the regulations governing crude rubber allocations for this quarter are known, there is reason in expecting that market conditions will improve. Prices have remained the same as a month ago.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert E. Beers, broker in crude rubber and commercial paper, No. 68 William street, New York, advises as follows:

The demand for commercial paper during September has been rather light, as for several months past, and the volume of rubber paper has also been small, the best names being quoted at 6¼ to 6½ per cent, and those not so well known, 6¾ to 7 per cent. With the drive for the Fourth Liberty Loan now on, the demand for paper will doubtless be very light.

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [August 1, 1918]:

The weekly rubber auction held yesterday and to-day opened very quietly, and in the early stages not more than 48 1/2 cents per pound was obtainable for the best ribbed smoked sheet. Later in the day, however, additional buyers came in, and, though prices for the leading grades show a reduction as compared with last week, there was a good demand at the lower level. The top price for both fine pale crepe and ribbed smoked sheet was 50 1/2 cents, being a decline of one cent upon crepe and 2 1/2 cents upon sheet. Brown and good dark crepes sold readily, but prices do not show any perceptible improvement. Of 1,170 tons catalogued, 628 tons were sold. The following was the course of values:

	In Singapore per Pound.	Sterling Equivalent per Pound in London.
Sheet, fine ribbed smoked	46c @ 50 1/2c	1/6 @ 1/7 1/4
Sheet, good ribbed smoked	36 @ 46 1/2	1/3 1/2 @ 1/2 6
Sheet, plain, unsmoked	48 1/2 @ 48 1/2	1/3 1/4 @ 1/2 6
Crepe, fine pale	38 @ 40	1/3 1/4 @ 1/2 6
Crepe, good pale	37 @ 40	1/3 1/4 @ 1/2 6
Crepe, fine brown	37 @ 40	1/3 1/4 @ 1/2 6
Crepe, good brown	37 @ 40	1/3 1/4 @ 1/2 6
Crepe, dark	17 @ 25	1/9 1/2 @ 1/7 3/8
Crepe, bark	5 1/2 @ 24 1/2	1/6 1/2 @ 1/13 1/4
Scrap, virgin, and pressed	15 @ 22 1/2	1/9 1/2 @ 1/10 1/2
Scrap, loose	11 @ 22 1/2	1/8 1/2 @ 1/11 1/4

SUMATRA RUBBER SHIPMENTS INCREASE.

Exports of plantation rubber from Belawan, Deli (Sumatra), increased from 16,418,000 pounds for 1916 to 28,949,000 pounds in 1917. The amounts were distributed as follows:

	1916.	1917.
United States	8,340,000	20,136,600
Holland	28,000	35,000
Great Britain	5,636,000	5,416,400
Canada	30,000	8,800
Straits Settlements	2,394,000	3,333,600
Hongkong		13,300
Japan		41,800

1,455,246 kilos, consisting of 434,185 kilos fine, 14,429 medium and 6,659 coarse, were shipped to Pará, final destination unknown. Total shipments from Manaoas were, therefore, 1,230,321 kilos.

(Compiled by Stowell & Co., Manaus.)

THE MARKET FOR RUBBER SCRAP.

Copyright, 1918.

NEW YORK.

THERE was a little more life in the rubber scrap market this past month than the one previous, one reason being the greater interest shown by the manufacturers in reclaimed rubber. The new regulations governing October-December rubber imports are practically the same, as far as tonnage is concerned, as during the last quarter. There is no doubt that, sooner or later, the available supply of rubber scrap will be drawn upon for emergency purposes.

BOOTS AND SHOES.—A small demand was noted in some quarters that was supplied at 8½ cents, although 8½ cents has been firmly quoted to reclaimers.

INNER TUBES.—The situation appears to be dormant and consumers have not shown interest of any sort in this market.

MECHANICALS.—These grades are in small demand, the movement being almost negligible, and prices unchanged.

TIRES.—The call has been hardly noticeable and for the most part limited to occasional lots of standard white tires. Prices are lower.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright, 1918.

NEW YORK.

WITH the announcement from Washington, on September 14, that the Government proposed to fix cotton prices, the market broke suddenly and prices declined 120 to 140 points, an equivalent of \$6 to \$7 per bale. As the month progressed, the market recovered and assumed an upward tendency, due to favorable crop estimates and the appointment by the Government of price control committees who had the confidence of the trade. A month ago middling spot cotton was 37.30 cents, and on September 27 the quotation was 35.15 cents, the strength of the market being due to favorable news from the front.

The committee has announced that the price of raw cotton will not be fixed immediately and that sufficient time will be allowed to elapse to test the effect as a stabilizing influence of the work assigned to the Committee on Cotton Distribution.

EGYPTIAN COTTON.—When the War Trade Board limited Egyptian cotton imports to 80,000 bales a year, and about 60,000 bales had already come in, there were 18,000 bales allocated to various importers. It now appears that this cotton has not been sold, indicating that the demand has fallen off about equally with the reduction of imports. It is well known that many tire manufacturers were forced to use combed Peellers and are continuing to do so, which accounts for a large amount of Egyptian cotton being released for other purposes.

SEA ISLAND COTTON.—It is rumored that holders are trying to artificially maintain prices by withholding supplies. Average extra choice sells for 70 to 73 cents landed at New England mill points. Egyptian Sakellarides can be delivered for about 10 to 13 cents less, but is uncertain of shipment, which accounts for the premium on Sea Island.

COTTON FABRICS.—The Price Fixing Committee of the War Industries Board has postponed the revision of prices on cotton fabrics until November 16. In readjusting certain parities, however, to make them conform more nearly to their basic relations, the following changes were made in maximum prices, taking effect October 1, 1918, and subject to revision, with other cotton products, on November 16, 1918:

Wide and sail duck, 37½ per cent discount from standard list. Standard army duck, 31½ per cent discount from standard list. Hose and belting duck, 62½ cents per pound. Ten ounce hose duck, 64½ cents per pound. Class A, 28½ cents per yard, card basis. Class B, 28 cents per yard, card basis. Class C, 27½ cents per yard, card basis. These classifications are described as follows:

Class A—To be duck made of white cotton without waste or strips, and counting not under 80 by 28. Also, qualities equal to Magnolia and Lindale to be in this class.

Class B—To be duck of all clean cotton, and counting not under 72 by 28. This class is recognized as the standard grade of single filling duck.

Class C—To be duck made to count not under 72 by 28, and containing not over 25 per cent of waste or strips.

Double filling duck:

Class A—Counting not under 80 by 28, 30½ cents per yard, card basis.

Class B—Counting not under 72 by 28, 30 cents per yard, card basis.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

Copyright, 1918.

NEW YORK.

THE Market on the base metals has been steady and strong. The Lead Producers' Committee has assumed complete control on lead by request of The War Industries Board. This amounts to governmental fixing of the price.

There is considerable demand for tin with little available to sell.

The price for copper after November 1 is a matter of speculation, depending on the sufficiency of the supply needed to fill the war demands.

CAUSTIC SODA.—Prices have not yet been fixed by government authority. The war needs require practically one-quarter of the country's production in the production of cleaners and explosives.

BARYTES.—Southern producers consider an advance in price inevitable in the near future owing to increased cost of production.

LITHOPONE has been advanced for carload lots for the last quarter of this year. The spot market is 8½ cents per pound. In anticipation of more restrictions by the Government, pigment manufacturers look for standardization and discontinuance of special brands.

ZINC OXIDE is in large demand and no increase of price is asked for the last quarter of the year.

SOLVENTS.—The country's stock of gasoline is said to be reduced to two or three weeks' supply, the amount consumed in September being of record proportions to be exceeded, no doubt, by the war demands of next Spring. The shortage will be serious for the rubber trade catering to civilian uses, with little prospect of relief through use of other solvents.

Presidential control of raw materials authorized by a recently enacted bill will affect rubber manufacturers as to supply of several rubber compounding ingredients in common use, such as antimony and magnesia products, chalk, fuller's earth, kaolin, graphite, mica and sulphur.

THE MAAS LATEX CUP.

A new latex cup which, it is claimed, does not retain rain-water, has been invented by Mr. Maas of the General Experiment Station of the A. V. R. O. S. (East Coast of Sumatra Rubber Planters' Association).

The cup consists of two parts: (1) the cup proper, which is of the usual type, but has a small piece of the rim cut out, by way of overflow; (2) a piece of metal—aluminum, tin or zinc, bent to resemble half a funnel, and provided with two ears by means of which it is adjusted to the cup in front of the overflow.

The cup is placed in such a way that the funnel-shaped opening is immediately under the tapping channel, so that the issuing latex enters the cup by the funnel. In case of rain, the water dripping from the trunk will enter the cup in the same way, and will continue to flow into the cup until the level on both sides of the funnel has risen to the overflow, when the rain-water will escape by this opening. The difference in specific gravity of water and latex will cause the latter, which is the lighter fluid and is separated from the overflow by means of the funnel wall, to remain in the cup.

Owing to the dry weather prevailing, no extensive experiment has been possible, but trial on a small scale with a simulated shower proved entirely satisfactory.

TABLE OF CONTENTS ON LAST PAGE OF READING.**FROM PLANTATION TO FACTORY DIRECT.**

MR. VAN DER MARK, addressing the Society of Rubber Planters at Batavia, Java, thus pictures the interests of planters and manufacturers:

In the past, when Europe was the greatest consumer of our product and the world trade was centered in England, it was inevitable that all producers were drawn to London. Circumstances, however, have made vast changes, many even now uncalculable, and America is to-day the greatest consumer. In all probability the United States will keep the advantageous position gained through the war and may be expected to improve on it. This being the case, and we see no reason for doubt, the European market for our product will be principally a transito market.

Any transito market between producers and consumers is, in principle, expensive and unnecessary. It is to the interest of producers and manufacturers to eliminate all unnecessary links in the chain that binds them together, especially, whenever a direct contact becomes possible. The long, long way from the East through the West to the East again is simply of interest and advantage to the transito trade and middlemen always profit at the expense of producers and manufacturers. We have reason to believe that the revival of trade between us and Japan, America, and Australia will not

be temporary but from the nature of things permanent and growing.

We rubber planters will cease to be dependent on Europe.

Evidences, plain and numerous, are at hand that a trade and center has been created which will carry weight and will continue to develop itself. This development will be healthy, not artificial, and opposition from elsewhere will be powerless to retard it. The difficulties confronting us will call forth higher energy and make us and our position stronger. All over the Indies preparations are being made to meet the changed circumstances, and for us rubber planters the time has come to obtain that position to which we have lawful title. It is our duty, gentlemen, to prepare the way and courageously attack self-interest and prejudice. We must get rid of our attachment to the old ruts to which the past has accustomed us, and break a new way, strong and powerful, for the attainment of higher aims.

The great interest we planters at Batavia have in coming into direct contact with our buyers, who are mostly all representing the manufacturer, cannot be overestimated. If Batavia becomes a prime market, you will meet the buyer personally, you can obtain information on many points at first hand, and you will in a short time become familiar with all his demands and qualifications. The buyer, on the other hand, will be able to visit your plantation and his cooperation will exercise an influence the results of which will be of utmost benefit to you.

As an instance of the great advantage of direct contact, I may mention the personal instructions given me by one of the largest purchasers of rubber at Batavia, which buys directly for the American manufacturers. The letter was in relation to the desire of the American Government to save tonnage by baling the rubber instead of following the old method of packing. The directions given in the letter and later explained and elucidated in conversation were so minute in all particulars that not a hitch occurred, and certainly to be able to get matters of this kind at first hand is of the greatest importance to planters.

This is only one instance showing conclusively what great interest you have in eliminating Europe and establishing directly your connections with your largest buyers.

RUBBER GOODS IN ENGLAND.

WHILE, on account of the war, the demand for a great many manufactured articles has decreased, the dismal prophecies made for the sporting goods trade have not been fulfilled. It was said that the small number of sportsmen left at home would be unable to take up much of the equipment on hand and traders felt serious apprehension when looking at their generously stocked shelves. But the woman chauffeur, conductor, letter-carrier, farmer and ammunition maker was followed by the woman sportsman with her cricket clubs, the forming of which was encouraged in many instances by the big firms and companies as a part of their welfare work. The women and the boys under 18 whose wages far exceed the pre-war earnings and who, therefore, are able and

willing to pay the higher prices, have made this year's business decidedly an excellent one.

The dealers in rubber toys, however, are unable to get much-needed supplies, and yet there is nothing to replace the goods that used to come from Germany. Colored balls, especially, would command stiff prices, but they are not to be obtained.

Leather used for soles in footwear is more and more being replaced by rubber to the great satisfaction of the wearer. One does not hear any more the old complaint: "The soles don't last." On the contrary, people begin to ask: "Will the upper last as long as the sole?"

The plans of the Government for manufacturing artificial limbs on an extensive scale are also contributing to the improvement and stimulation of a portion of the rubber trade. In other fields, notably in that part of the bicycle supply trade concerned with covers, tubes, etc., there is serious fear of an approaching shortage.

As to the tennis shoes and other light footwear, large quantities could be sold if they were available, but the outlook for increasing supplies is far from encouraging. Generally, rubber manufacturers are too busy with war necessities to handle other trades.

PICKING ON PONTIANAK.

ANDREW H. KING, who writes interestingly and often for "Chemical and Metallurgical Engineering," gives some surprising information concerning Pontianak in the August issue of that excellent journal. To avoid error we quote:

The supply of Pontianak is to-day almost exhausted. This is due solely to the wasteful and extremely primitive methods used by the natives in securing the gum. Where they might have tapped the trees and built up a steady business they felled and bled them at many different points. The method produced quick results but the procedure reminds one of the old fable about killing the goose that laid the golden egg. In 1909 a good grade of Ponti could be secured at 5 cents per pound. The market price is now around 30 cents per pound, making Ponti no longer a profitable purchase.

Did we say to avoid error? Accurately, it should be to correct errors.

The fact is that few Pontianak trees (*Dyera costulata*) are destroyed by native gatherers. The British and Dutch authorities long ago stopped all that. As for the supply being exhausted, the United States received 23,000,000 pounds in 1917. Schidrowitz figured that there were 160,000,000 pounds in Sarawak, the Dutch East Indies and the Federated Malay States. More than that amount has already been consumed, and Pontianak still arrives, or would if it were not war-time.

As for the price being around 30 cents per pound, with all respect, that seems high. Taking Bandjer-massin as a typical grade, its average price for 1917 was 13 cents per pound; for the first eight months in

1918 it was 14 cents per pound. Mr. King's broker overcharged him.

"COMMERCIAL CAMOUFLAGE."

GERMAN rubber goods after the war are likely to bear American, English, French, Swedish or any trade-marks other than German. This is stated by the "Economic Gazette" of the Central Powers which thus advises German exporters:

After the war German trade will be possible only through neutral countries. All marks of German origin will, therefore, have to be obliterated from all wares exported. Considerations of international morality must be brushed aside.

It will be a very long-handled brush that will enable the German to get within reach of morality of any sort.

FISH-SCALE RUBBER.

THE inventor of fish-scale rubber, unless he be a very modest man, is likely to be dazzled by the bright light of publicity thrown upon him by "The Scientific American" and "The Literary Digest." Mention in such high-class publications is likely to cause him to add at least \$1,000,000 to the asking price for the usual half interest. As a friend to all who strive to add to the world's supply of rubber whether it be natural or artificial, plantation or synthetic, we trust he will keep his head. Success in making rubber from fish-scales is but a beginning and he owes it to the world that he continue. It is evident that rubber made from the scales of the tender minnow will show neither the tensile strength or the resilience shown by that made from the fighting tarpon. He should, therefore, establish grades of fish scale rubber. Furthermore, as the pioneer scalloptomist it is his duty to exploit scales to the uttermost. Fish are not the only scalebearers. Scales are abundantly found on bird and beast, at present waste material, perhaps recoverable, possibly rubbery. Then as a last resort come scalene triangles and the chromatic scale.

THE FACT THAT ONE IS AN EXPERT IN THE SALE OR use of a commodity does not prove complete knowledge of it. As an instance in point one of the old-time big operators in Caucho always sold it as "Cow chow," suggesting mixed pickles. This leads to the query as to whether the word "Joolatong" for Jelutong is not from a source, able commercially, but of indifferent philological attainments.

SEVERAL MONTHS AGO THE WAR DEPARTMENT authorized the statement that American gas masks were effective against all German gases. Major H. W. Duffy, of the British-American gas service, now declares that the fumes of American gas shells penetrate even the most modern of German masks. Apparently we have worsted the Hun at his own game both going and coming.

War News of the Rubber Industry.

The Fourth Liberty Loan. The Fourth Liberty Loan in Greater New York. Liberty Loan Publicity by the Rubber Industry. The Liberty Loan in Massachusetts. Government Officials in Charge of Rubber Matters. Quartermaster's Department Orders 1,395,680 Pairs of Rubber Boots. Limited Cargo Space for Exports to Russia. The Government Requests Nut-shells for Gas-mask Carbon. Details of Rubber Button Manufacture. The Bicycle Is Coming Back. Waterproof Garments Seized by the Government. Service Notes and Personals. Martyrs to the Cause of Liberty. Letters from the Front. New General License Does Not Affect Rubber. Procedure Governing Exports to Sweden.

THE FOURTH LIBERTY LOAN.

Final official totals of the Fourth Liberty Loan are not yet available, but Treasury Department estimates indicate that the 22,000,000 or more individual subscriptions will probably aggregate some \$250,000,000 in excess of the \$6,000,000,000 set as the amount of the loan. This result, coming as it has at a time when Allied victories everywhere and the peace overtures of the Central Powers are engaging the thought of the world, and when the epidemic of so-called Spanish influenza has discouraged pub-

THE GOODRICH COMPANY'S NEW YORK CITY WINDOW DISPLAY.

lic gatherings in many of the eastern states and in several cities closed theatres, churches, halls and schools throughout the drive, indicates more clearly than has any other loan the high resolve, united purpose, and inflexible determination of the American people that the world shall have freedom, justice, and an end of decisions by the sword. Most communities throughout the country "went over the top" with their quotas, and the rubber manufacturing centers are among those proudly flying their honor flags. The rubber industry as a whole took up its share of the task with the same whole-hearted spirit that has characterized its previous efforts, and to the generosity and enthusiasm of rubber companies, officials and employees alike, is due in no small measure the notable results achieved in New York, Ohio, New England, New Jersey, Pennsylvania, Illinois and elsewhere.

THE FOURTH LIBERTY LOAN IN GREATER NEW YORK.

The rubber industry of Greater New York demonstrated its belief in Liberty's cause by a subscription of \$10,775,050 to the Fourth Liberty Loan.

The success of this campaign is largely due to the organization created by the Liberty Loan Committee of the Rubber Industry comprising a Central Committee and Divisions, representing branches of the rubber industry. The following is a list of the total subscriptions and the accredited divisions:

WINDOW DISPLAY OF THE UNITED STATES RUBBER CO., NEW YORK CITY.

LIBERTY LOAN PUBLICITY BY THE RUBBER INDUSTRY.

Much valuable publicity was donated by the rubber industry to promote the Fourth Liberty Loan. Several patriotic advertisers devoted space in the October issue of this journal to an appeal to buy bonds to the utmost. THE INDIA RUBBER WORLD

donated a double-page spread and "The Publishers' Page" to the same worthy cause.

Forty-two representative members of the rubber trade of New York City, including THE INDIA RUBBER WORLD, contributed full pages in leading daily newspapers to assist the Liberty Loan Committee of the Second Federal Reserve District.

THE LIBERTY LOAN IN MASSACHUSETTS.

In Massachusetts 80 rubber firms subscribed \$2,988,000 and 20,818 employees subscribed \$1,847,400, making a total of \$4,835,400, or nearly double the corresponding subscription to the previous loan. The 100 per cent firms were the Acushnet Process Co., Aetna Rubber Co., Ajax Rubber Co., Akron Tire & Rubber Co., Athol Manufacturing Co., Atlantic Rubber Co., A. S. Brock Rubber Co., Eastern Rubber Co., Easthampton Rubber Thread Co., Firestone Tire & Rubber Co., Globe Rubber Works, The B. F. Goodrich Co., Worcester, Goodyear Tire & Rubber Co., Spring-

field, Haverhill Rubber Co., Oliver R. Howe, Lawrence Rubber Co., Mayflower Rubber Works, Monaquiot Rubber Works Co., Needham Tire Co., Panther Rubber Manufacturing Co., Para Rubber Co., Lewis E. Tracy.

The Fisk Rubber Co. employees made a remarkable record of 98.4 per cent, 3,037 out of 3,085 employees subscribing \$346,850. When the influenza epidemic made it impossible to hold meetings to promote the bond-selling campaign, this important work was taken up by the weekly "Fisk Bulletin," and a daily edition was published.

Other firms having large working forces, whose employees made especially high records were the Converse Rubber Co., 93.6 per cent; Standard Woven Fabric Co., 93.3 per cent; Boston Rubber Shoe Co., 90.4 per cent; Hood Rubber Co., 85.1 per cent; Revere Rubber Co., 77.7 per cent; Plymouth Rubber Co., 74.1 per cent; American Rubber Co., 81.9 per cent.

GOVERNMENT OFFICIALS IN CHARGE OF RUBBER MATTERS.

The following list of government officials having to do with rubber control has been compiled by the secretary for the 1918 Year Book of The Rubber Association of America, Inc.

WAR INDUSTRIES BOARD.

Bernard M. Baruch, Chairman.
Judge Edwin B. Parker, Priorities Commissioner and Chairman of Priorities Committee.
George N. Peek, Commissioner of Finished Products.

TEXTILE DIVISION.

John W. Scott, director.

RUBBER AND RUBBER GOODS SECTION.

Harry T. Dunn, Chief.

Assistants—J. W. Rowland, H. E. Joy, J. C. Matlack, G. E. C. Kelly.

COTTON GOODS SECTION.

Spencer Turner, Chief.

CONSERVATION DIVISION.

A. W. Shaw, Chairman.

Melvin T. Copeland, Executive Secretary.

CHEMICALS DIVISION.

Charles H. MacDowell, Director.

SULPHUR AND PYRITES SECTION.

Wm. G. Woolfolk, Director.

ELECTRIC WIRE AND CABLE SECTION.

LeRoy Clark, Director.

MEDICAL SECTION.

Lt. Col. F. F. Simpson, Director.

RESOURCES AND CONVERSION SECTION.

Chas. A. Otis, Director.

WAR TRADE BOARD.

Clarence M. Woolley, Representative of the Secretary of Commerce.

Edwin F. Gay, Representative of the United States Shipping Board.

BUREAU OF IMPORTS.

Frederick B. Peterson, Director.

William E. Bruyn, Commercial Adviser.

Walter H. Dickerson, Trade Adviser for Rubber and Kindred Products.

E. B. Wilson, Counsel.

BUREAU OF EXPORTS.

C. A. Richards, Director.

BUREAU OF RESEARCH.

Arthur E. Swanson, Director.

WAR TRADE INTELLIGENCE BUREAU.

Paul Fuller, Jr., Director.

QUARTERMASTER'S DEPARTMENT ORDERS 1,305,680 PAIRS OF RUBBER BOOTS.

The Quartermaster's department of the United States Government has placed orders for hip boots and short boots with practically every footwear manufacturing concern, to be delivered on or before January 1, 1919. The order, which amounts to 1,305,680 pairs, is allotted as follows:

Apsley Rubber Co., 42,515 pairs of hip boots and 1,589 pairs of short boots; Beacon Falls Rubber Shoe Co., 45,016 pairs hip boots; 1,682 pairs short boots; Bourn Rubber Co., 18,757 pairs hip boots; 701 pairs short boots; Converse Rubber Shoe Co., 42,515 pairs hip boots and 1,588 pairs short boots; Firestone Tire & Rubber Co., 106,288 pairs hip boots and 3,971 pairs short boots; The B. F. Goodrich Co., 96,285 pairs hip boots and 3,597 pairs short boots; The Goodyear Tire & Rubber Co., 7,503 pairs hip boots and 280 pairs short boots; Hood Rubber Co., 331,369 pairs hip boots and 12,300 pairs short boots; La Crosse Rubber Co., 31,261 pairs hip boots and 1,168 pairs short boots; Lambertville Rubber Co., 10,004 pairs hip boots and 374 pairs short boots; Mishawaka Woolen Manufacturing Co., 85,631 pairs hip boots and 3,177 pairs short boots; United States Rubber Co., 433,988 pairs hip boots and 16,211 pairs short boots.

In addition to these there was awarded to the United States Rubber Co. the following out-sizes; 5,032 pairs of hip boots and 188 pairs of short boots, size 14, and 2,516 pairs of hip boots and 94 pairs of short boots, size 15.

LIMITED CARGO SPACE FOR EXPORTS TO RUSSIA.

The War Trade Board announces that a limited amount of cargo space may be available for shipments of all commodities from the Pacific Coast direct to Vladivostok. Applications for export licenses will now be considered, and in allocating space, preference will be given to material covered by licenses issued on or after October 7, 1918. Exporters are requested to file their applications with the Bureau of Exports, War Trade Board, Washington, D. C.

DETAILS OF RUBBER BUTTON MANUFACTURE.

The largest factory in the world manufacturing rubber buttons is located at College Point, Long Island, New York. In normal times it makes dress buttons to the value of \$60,000 a year, and some uniform buttons for the Navy. At present its entire output is being used for this latter purpose, so great is the demand, and this business amounted in 1917 to about \$120,000. This concern employs about 85 workers, half of whom are women, and pays wages proportionate to those in other branches of the button industry. The process of manufacture¹ is described as follows:

The calendered plastic sheets of rubber are first vulcanized hard, and then warmed on steam tables and thus softened to facilitate the cutting. The blanks are then punched out by power presses, and allowed to harden before being sent to the button presses where they are again warmed on steam tables until they become soft; in this state they are patterned in heated, highly finished steel dies operated by hand presses. Two buttons are patterned in each die and press, and they must remain in the press until they are cool and the pattern is set. One operator manages eight of these presses, the feeding and emptying of which in turn require about the time needed for cooling the buttons. One operator can produce from 20 to 40 gross per day, according to size, with 8 presses. When the button leaves the press it is practically complete except for the holes which are drilled through it with semi-automatic machinery. This process requires great care and skill, in order to prevent the drilling from interfering with the pattern or finish of the button. Countersinking at the back of the button removes the sharp edge around the holes,

and the removal of the sharp fin or film of rubber left around the outer edge is accomplished by the pressing operation. Rubber buttons are made in one piece, and usually have from two to four holes drilled from face to back. Very few are self-shank, and none are made with a metal shank.

Owing to the costly material used and to the many expensive labor operations through which the goods must pass, production is usually limited to dress buttons for women's and men's clothing, and chiefly to black, because of the impossibility of coloring hard rubber. The buttons range in size from 18 to 70 lines, and in price from 60 cents to \$7.50 per gross. There is no foreign competition and none of these buttons are exported.

The manufacture of Navy buttons proceeds somewhat differently, however, for the reason that it is necessary for these buttons to be heat-proof and not liable to have their pattern obliterated or their shape drawn back to the blank form by the application of heat sufficient to soften the rubber, as will happen with buttons made by the method just described.

Navy buttons are not made from flat discs or blanks punched from sheets; the blanks are pressed to near the finished form from the plastic rubber and are partly hardened by vulcanization;

RUBBER BUTTONS FOR OUR NAVY.

they thus have the finished shape of the button but are without any pattern or design. They next go to the imprint dies in which they are shaped under hydraulic pressure between steam-heated plates and allowed to remain until fully cured; no amount of afterheating can obliterate the device imprinted on their faces. Each man operates a sufficient number of presses to permit filling, pressing, vulcanizing, cooling, and emptying, without any loss of time, and production averages about 20,000 small or 8,000 large buttons per day per man.

Unlike the buttons made by the other process, these heat-proof buttons do not come from the presses with polished surfaces; the polishing is a hand operation requiring the application, by means of a special holding tool, of each button separately to a rapidly revolving polishing buff. Before the buttons have arrived at this stage they have passed through several inspections and all imperfect ones have been rejected. After polishing they go through a final inspection and are then packed in boxes ready for delivery.

THE GOVERNMENT REQUESTS NUT-SHELLS FOR GAS-MASK CARBON.

Much has been published concerning the patriotic work of those who have entered the employ of the gas-mask manufacturers to meet the demand for workers to replace the men gone overseas. Now another opportunity for patriotic service presents itself to the whole people. The Government needs 1,000,000 pounds of nut-shells and fruit-pits daily for manufacturing charcoal to put into the gas-masks. At present it is able to purchase only about one-third of this amount, pending the completion of arrangements to secure supplies from the Far East.

The Chemical Warfare headquarters has renewed its appeal to the public to save all the pits and shells possible, as a charcoal better for the purpose is made from these than from wood. Many individuals probably think the few shells or pits they can save make no difference, but it is only another instance of the little making much when multiplied by the number of people in the whole country. Receptacles have been placed in public places where dried fruit pits and nut shells may be contributed, and the public is urged to co-operate in furnishing these materials toward the completion of the gas-masks which are so greatly needed by our soldiers overseas.

¹From Tariff Information Series, No. 4, "The Button Industry."

THE BICYCLE IS COMING BACK.

The War Industries Board has put the stamp of approval on the bicycle as a healthful and virtually indispensable form of locomotion and a direct contributor to greater efficiency, both in manufacturing centers and the country. The present spirit of economy, the prevalence of good roads, and the durability of modern bicycle tires are all proving potent factors in restoring the bicycle to popular favor. All indications point to a big bicycle year in 1919, with consequent increase in the demand for rubber tires.

WATERPROOF GARMENTS SEIZED BY THE GOVERNMENT.

So great is the demand for raincoats and waterproof garments that about the middle of October the Government notified every manufacturer to cease delivering any such garments, sold or unsold, which were then in their possession or might be up to and including October 26, these goods to be shipped immediately to the Government for use in the cantonments in this country. It was the desire of the Government thus to secure a practical, immediate delivery of a million coats, but as near as can be ascertained about 275,000 were thus obtained. This is in no way to be confused with the regular contracts for coats for use of the Army overseas.

SERVICE NOTES AND PERSONALS.

Six men on October 22 undertook to fly a new Navy twin-motor dirigible balloon from Akron, Ohio, to Rockaway, N. Y.

Among them were Lieut. Donald T. Hood, son of Frederic C. Hood, Hood Rubber Co., Watertown, Massachusetts, and Lieut. Ralph A. D. Preston, formerly in charge of the flying field of the Goodyear Tire & Rubber Co., Akron, Ohio. The first lap of the trip to Washington, District of Columbia, took nine hours and the rate of speed averaged 35 miles an hour. The dirigible flew over the city and made a landing at Anacostia aviation field for fuel, after which the trip was continued.

Private Joseph Pezzullo, who formerly worked for the Bourn Rubber Co., Providence, Rhode Island, has been severely wounded while serving with Company M, 328th Infantry, in France. He went to Camp Devens on October 3, 1917, and went overseas last spring.

Henry G. Tyer, president of the Tyer Rubber Co., Andover, Massachusetts, left October 22 for Camp Taylor, Kentucky, to enter the Artillery Officers' Training School. He is 33 years of age. His business associates presented him with an engraved wrist-watch previous to his departure.

O. M. Brede, assistant secretary of the Detroit section of the Society of Automotive Engineers, is now stationed at the Aviation Repair Depot, Dallas, Texas, and is a corporal in the 877th Aero Squadron. Mrs. Brede will perform his secretarial duties in his absence.

F. M. Morris, factory paymaster of the Firestone Tire & Rubber Co., Akron, Ohio, recently enlisted in the Quartermaster's department and is at Camp Meade, Washington.

A. H. Miner, formerly in the legal department of The B. F. Goodrich Co., Akron, Ohio, has secured a first lieutenant's commission in the Chemical Warfare Service (unattached) of the American Expeditionary Forces.

Lieutenant-Colonel Fred Garcin, son of Edward H. Garcin, of Edward H. Garcin & Co., 1790 Broadway, New York City, is doubtless the youngest lieutenant-colonel in the United States Army. He has been in the service for nine years and has taken every advancement in rank from second lieutenant to his present grade. His station is with the South Pacific Coast Artillery, District of San Francisco.

On his return from duty at the British Embassy in London, H. Stuart Hotchkiss was promoted to the rank of lieutenant-colonel and attached to the Bureau of Aircraft Production as chief of the raw materials department in Washington, D. C.

John L. Ryan, a former traveling salesman out of Milwaukee for the Goodyear Tire & Rubber Co., Akron, Ohio, is now a sergeant in Company F, 340th Infantry, 85th Division, American Expeditionary Forces. Robert E. Lee, head of the department

of labor of the Firestone Tire & Rubber Co., Akron, Ohio, has been elected Chief of the Personnel Staff of the Quartermaster General's office, Washington, District of Columbia. He will have charge of selecting men to fill positions in the United States Quartermaster's Department. Mr. Lee has been with the Firestone company for more than five years.

H. G. Zimmerman, formerly with the San Francisco branch of The B. F. Goodrich Co., Akron, Ohio, is now in service at Section Naval Base, United States Harbor Patrol, San Diego, Calif.

ROBERT E. LEE.

Diomedes Pereyra y M., a former employee in the art division of the advertising department of The B. F. Goodrich Co., Akron, Ohio, speaking French, Spanish and Portuguese in addition to English, is now in Uncle Sam's service as an interpreter in France. He comes from a well-known Spanish family in Bolivia.

Paul H. Loewenthal, of The Loewenthal Co., 23 Heyward street, Brooklyn, New York, has enlisted in the Tank Corps.

Lyman L. Weld, formerly of the advertising department of The B. F. Goodrich Co., Akron, Ohio, has arrived in France to assist A. B. Jones, recently placed in charge of French Red Cross supplies.

MARTYRS TO THE CAUSE OF LIBERTY.

CAPTAIN RALPH W. STEWART, an officer in the Fife & Forfar Yeomanry, was killed in action on September 2, 1918. He was a member of the firm of Ralph W. Stewart & Co. (Scottish Central Rubber Co.), manufacturing rubber boots and shoes, waterproofs, and general rubber goods at Dunfermline, Scotland.

Mrs. Jesse Sinclair of Providence, Rhode Island, has received word from the Canadian authorities that her husband was killed in action September 30, 1918. He worked for the Revere Rubber Co., in Chelsea, Massachusetts, for several years and later was a tire finisher for five years for the same company in its Providence plant. He enlisted in the British Canadian Infantry forces a year ago and went overseas last January. He leaves his widow and one daughter.

Ernest W. Crosley, formerly employed by the Glendale Elastic Fabric Co., Providence, Rhode Island, is reported to have been killed in action September 22. He was chief gunner in a machine gun battalion. Leaving Providence for Camp Dix on April 28 last, he went overseas in May, and was promoted to first-class private upon arrival in France.

The Cuban Tire & Rubber Co. (Compania Cubana de Zunchos y Goma), Havana, Cuba, subscribed \$10,000 to the Fourth Liberty Loan, doubling its subscription to the Third Liberty Loan.

LIEUTENANT
R. A. D. PRESTON.

SERGEANT DUMONT SHELLS THE HUNS.

SOMEWHERE IN FRANCE.

DEAR ———: Well, old top, I am still alive and unwounded, but just my good luck saved me so far, as we certainly have been shot up some. I have had the — old shells strike within a few feet of me and I would fall to the ground when I heard them coming. You know you can hear them coming and then everyone falls to the ground or gets into his dug-out. Our battery has had pretty bad luck—35 casualties out of 210 men and we have been on an active front for only three weeks. Four have been killed and the balance wounded and gassed. We had two men put out of commission the second day we were here.

On August 22 I was sitting eating my meal on a table that the boches had left in their retreat and had just got up to get second on the feed when along came a shell and knocked the table clean out of sight. I was congratulating myself on my escape with a number of the fellows, and was looking at the hole it made, when the Hun started bombarding us. It lasted about an hour and killed our battery commander and one other man. It also gassed about twenty others and killed twelve horses. Lieutenant Ried, who was killed, was in a dug-out, and he got hit by a direct shot which very few dug-outs can stand. These dug-outs are built in the ground by the men about four to five feet deep and covered with bags and dirt. You have to get into them like a rabbit. The hole is just large enough to get into and as I am by no means as large as I used to be, the hole does not have to be very big. After you are in, you have a few rats for company. This is what happened to me. I had left my cap inside of the dug-out one evening, as most of the time we wear steel helmets, and we were ordered to move the next afternoon. I started to pick up my cap when a rat ran out but did not seem very anxious to leave. I looked inside of my cap and I saw that it had eaten a hole in it and inside had made a home for itself and had left six young ones.

The next day after our battery commander was killed, another of our men was killed watering his horse along the road and I was ordered to take a detail of men and bury him. While I was burying him, we were under more or less of shell fire. We finished our job and had started back when a shell hit near us and two of our men were wounded. You ought to have heard me curse those Germans as we had to carry the fellows about two miles to the Aid Station. The wounds did not amount to much as the men were hit in the leg. Our regiment has been hit pretty hard with casualties but expects to go to a rest camp soon and reorganize.

I am on duty now with the guns for twenty-four hours and it is some hard job as you have very little chance to sleep. Last

SERGEANT L. W. DUMONT.

LETTERS FROM THE FRONT

night I had to fire a shot every fifteen minutes. On each shell I fired I wrote a name in chalk. I wrote yours, Pell's, Stiles', Ellis', Obalski's, Sweeney's, Maturer's, Baird's, Miss Breaker's, Miss Rose's, Miss Lucey's and several others. We have twenty-four hours on and twenty-four hours off.

You should see the air fights. We have them every day and it certainly is a wonderful sight but with all the sights and excitement, would give an arm to be back on Broadway and back in business harness again. I have just this minute been told that one of our corporals has been killed; he was hit by a shell and the largest piece of him left was about two feet long. They say he is a terrible sight. This war is terrible. You never know from one second to another when you are going "West," and this corporal was just walking from the guns to the main camp. I sometimes wonder if any of us will get back. Sergeant Becker has gone to the Officers' Training School and Sergeant Welsh has been made a first sergeant. I can give you very little news about the way the war is going as you get more news in the States than we do. On our sector we have Fritz worried. He is making a stand but before long we will soon send him on his way again.

Please remember me to all the bunch in the office and all inquiring friends.

Sincerely,

DUMONT.

NEW GENERAL IMPORT LICENSE DOES NOT AFFECT RUBBER.

Rubber crude, scrap and reclaimed; balata, jelutong, gutta percha, gutta siak; manufacturers of rubber; also raw cotton, cotton duck and yarn, are among the commodities specifically excluded from the terms of the new general import license P.B.F. No. 27, effective on and after October 1, 1918, covering the importation of all commodities into the United States from the United Kingdom, France, Italy, or their European or Mediterranean African possessions or protectorates.

PROCEDURE GOVERNING EXPORTS TO SWEDEN.

Arrangements have been made by the War Trade Board with the following import associations in Sweden to accept, on behalf of the Swedish importer actually interested, consignments of the articles mentioned below:

Rubber and rubber goods: Rubber Import Association.

Chemicals, technical oils, antimony, sulphide, sulphur, and similar commodities: Chemical Industries Import Associations.
Cotton Textiles: Textile Import Association.

Exporters in the United States, before filing applications for export licenses, must obtain from the prospective importer in Sweden advice that there has been issued by an appropriate importing association, or by the Statens Handels Kommission, subsequent to June 28, 1918, a certificate covering the proposed consignment. The number of the certificate should be forwarded by the importer in Sweden to the American exporter. This number should be specified on Supplemental Information Sheet X-104, which must be duly executed and annexed to Application Form X for an export license.

The shipment must be consigned to the export association that issued the certificate, and exporters are required to state on the application the name of the person or firm in whose favor the import certificate was issued. Shipments may be made only on vessels flying the Swedish flag.

Activities of the War Service Committee of the Rubber Industry of the U. S. A.

THE War Service Committee of the Rubber Industry of the U. S. A. has been working incessantly in behalf of the whole industry and matters of greatest importance to the trade have engaged the attention of this committee during the past month, a complete record of which will be found in these columns.

The Committee has been enlarged and Division Committees appointed, and a plan of organization and procedure governing the latter committees has been adopted. The personnel of the various committees is given below:

PERSONNEL OF THE WAR SERVICE COMMITTEE CENTRAL COMMITTEE.

B. G. Work, chairman, The B. F. Goodrich Co., 1780 Broadway, New York City.
Homer E. Sawyer, vice-chairman, United States Rubber Co., 1790 Broadway, New York City.
E. H. Broadwell, The Fisk Rubber Co., Chicopee, Falls, Massachusetts.
H. S. Firestone, Firestone Tire & Rubber Co., Akron, Ohio.
J. Newton Gunn, United States Tire Co., 1790 Broadway, New York City.
G. B. Hodgman, Hodgman Rubber Co., Tuckahoe, New York.
W. J. Kelly, Poel & Kelly, Inc., 347 Madison avenue, New York City.
P. W. Litchfield, The Goodyear Tire & Rubber Co., Akron, Ohio.
C. T. Wilson, Charles T. Wilson Co., Inc., 56 Wall street, New York City.
E. S. Williams, United States Rubber Co., 1790 Broadway, New York City.
TREASURER: H. S. Vorhis, 52 Vanderbilt avenue, New York City.
SECRETARY: M. L. Heminway, 52 Vanderbilt avenue, New York City, and 808 Colorado Building, Washington, District of Columbia.

AIRCRAFT DIVISION.

P. W. Litchfield, chairman, The Goodyear Tire & Rubber Co., Akron, Ohio.
W. H. Yule, The B. F. Goodrich Co., Akron, Ohio.
A. E. Jure, United States Rubber Co., Newark, New Jersey.

BOOT AND SHOE DIVISION.

George H. Mayo, chairman, United States Rubber Co., 1790 Broadway, New York City.
Francis S. Dane, vice-chairman, Hood Rubber Co., Watertown, Massachusetts.
Hugh Bullock, Converse Rubber Shoe Co., Malden, Massachusetts.
Robert S. Emerson, Narragansett Rubber Co., Bristol, Rhode Island.
A. S. Funk, La Crosse Rubber Mills Co., La Crosse, Wisconsin.
W. G. Hill, Apsley Rubber Co., Hudson, Massachusetts.
T. W. McDowell, Goodyear Rubber Co., Middletown, Connecticut.
L. T. McCollum, Mishawaka Woolen Manufacturing Co., Mishawaka, Indiana.
Francis R. McKenna, Bourn Rubber Co., Providence, Rhode Island.
Theodore Nicar, Firestone Tire & Rubber Co., Akron, Ohio.
George W. Prall, Lamberville Rubber Co., Lamberville, New Jersey.
J. A. Rishel, The B. F. Goodrich Co., Akron, Ohio.
L. C. Warner, Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut.
SECRETARY: E. S. Sylvester, United States Rubber Co., 1790 Broadway, New York City.

CLOTHING DIVISION.

N. Lincoln Greene, chairman, American Rubber Co., Boston, Massachusetts.
George G. Bryant, vice-chairman, Chicago Rubber Clothing Co., Racine, Wisconsin.
Charles Brown, Mystic Rubber Co., West Medford, Massachusetts.
J. T. Callahan, Archer Rubber Co., Milford, Massachusetts.

S. T. Hodgman, Hodgman Rubber Co., Tuckahoe, New York.
W. G. Hill, Apsley Rubber Co., Hudson, Massachusetts.
Dr. L. C. Hinchbaugh, British-American Manufacturing Co., Springfield, Connecticut.
F. W. Jones, The B. F. Goodrich Co., Akron, Ohio.
C. Kenyon, Jr., C. Kenyon Co., 754 Pacific street, Brooklyn, New York.
E. C. Klauber, Rosenwald & Weil, Chicago, Illinois.
Warren MacPherson, Cambridge Rubber Co., Cambridge, Massachusetts.
John V. McHose, Scioto Rubber Co., Columbus, Ohio.
Charles Place, New York Mackintosh Clothing Co., Mamaroneck, New York.
W. M. Tenney, Clifton Manufacturing Co., Boston, Massachusetts.
SECRETARY: B. L. Swift, American Rubber Co., Boston, Massachusetts.

CRUDE RUBBER AND KINDRED PRODUCTS DIVISION.

C. T. Wilson, chairman, Charles T. Wilson Co., Inc., 56 Wall street, New York City.
G. B. Hodgman, vice-chairman, Hodgman Rubber Co., Tuckahoe, New York.
E. H. Broadwell, The Fisk Rubber Co., Chicopee Falls, Massachusetts.
E. H. Huxley, United States Rubber Export Co., Limited, 1790 Broadway, New York.
W. J. Kelly, Poel & Kelly, Inc., 347 Madison avenue, New York City.
H. E. Sawyer, United States Rubber Co., 1790 Broadway, New York City.
B. G. Work, The B. F. Goodrich Co., 1780 Broadway, New York City.
SECRETARY: H. S. Vorhis, 52 Vanderbilt avenue, New York City.

FOREIGN TRADE DIVISION.

E. H. Huxley, chairman, United States Rubber Export Co., Limited, 1790 Broadway, New York City.
F. E. Titus, vice-chairman, The B. F. Goodrich Company, 1780 Broadway, New York City.
J. E. Baum, Empire Rubber & Tire Co., Trenton, New Jersey.
E. H. Broadwell, The Fisk Rubber Co., Chicopee Falls, Massachusetts.
F. E. Dayton, Ajax Rubber Co., Inc., 1796 Broadway, New York City.
R. H. DANIELS, The Goodyear Tire & Rubber Co., Akron, Ohio.
A. S. Hardy, Manhattan Rubber Manufacturing Co., 120 Broadway, New York City.
W. B. Loughton, Hood Rubber Co., Watertown, Massachusetts.
George H. Moss, Electric Cable Co., 10 East 43d street, New York City.
R. J. Owens, Boston Woven Hose & Rubber Co., Boston, Massachusetts.
A. G. Partridge, Firestone Tire & Rubber Co., Akron, Ohio.
Henry G. Tyer, Tyer Rubber Co., Andover, Massachusetts.

GAS DEFENSE DIVISION.

Dr. W. C. Geer, chairman, The B. F. Goodrich Co., Akron, Ohio.
William Stephens, vice-chairman, The Goodyear Tire & Rubber Co., Akron, Ohio.
George W. Dann, Pennsylvania Rubber Co., Jeannette, Pa.
R. T. Griffith, The Miller Rubber Co., Akron, Ohio.
Dr. L. C. Hinchbaugh, British-American Manufacturing Co., Springfield, Connecticut.
George A. Ludington, The Fisk Rubber Co., Chicopee Falls, Massachusetts.
T. W. Miller, Faultless Rubber Co., Ashland, Ohio.
Dr. Theodore Whittelsey, United States Rubber Co., 1790 Broadway, New York City.
SECRETARY: N. S. Noble, The B. F. Goodrich Co., Akron, Ohio.

HARD RUBBER DIVISION.

H. Weida, chairman, India Rubber Co., New Brunswick, New Jersey.
F. G. Achelis, vice-chairman, American Hard Rubber Co., 11 Mercer street, New York City.
Bruce Bedford, Luzerne Rubber Co., Trenton, New Jersey.
Harry Boyer, Joseph Stokes Rubber Co., Trenton, New Jersey.

J. W. Maguire, Brunswick-Balke-Collender Co., Muskegon, Michigan.
 Samuel H. Dodd, Vulcanized Rubber Co., 251 Fourth avenue, New York City.
 John Joseph, The B. F. Goodrich Co., Akron, Ohio.

INSULATED WIRE AND CABLE DIVISION.

Wallace S. Clark, chairman, General Electric Co., Schenectady, New York.
 Edward Sawyer, vice-chairman, Atlantic Insulated Wire & Cable Co., 52 Vanderbilt avenue, New York City.
 Joseph C. Belden, Belden Manufacturing Co., Chicago, Illinois.
 T. Whitney Blake, Whitney Blake Manufacturing Co., New Haven, Connecticut.
 George B. North, Hazard Manufacturing Co., 533 Canal street, New York City.

MECHANICAL GOODS DIVISION.

E. S. Williams, chairman, United States Rubber Co., 1790 Broadway, New York City.
 George E. Hall, vice-chairman, Boston Woven Hose & Rubber Co., Boston, Massachusetts.
 I. R. Bailey, The Goodyear Tire & Rubber Co., Akron, Ohio.
 C. C. Case, United States Rubber Co., 1790 Broadway, New York City.
 C. A. Daniel, Quaker City Rubber Co., Philadelphia, Pennsylvania.
 C. D. Garrettsen, Electric Hose & Rubber Co., Wilmington, Delaware.
 J. H. Kelly, Hewitt Rubber Co., Buffalo, New York.
 J. A. Lambert, Acme Rubber Manufacturing Co., Trenton, New Jersey.
 Guy E. Norwood, Republic Rubber Corp., Youngstown, Ohio.
 B. H. Pratt, The Federal Rubber Co., Cudahy, Wisconsin.
 W. O. Rutherford, The B. F. Goodrich Co., Akron, Ohio.
 Henry Spadone, Gutta Percha & Rubber Manufacturing Co., 126 Duane street, New York City.
 Arthur F. Townsend, Manhattan Rubber Manufacturing Co., Passaic, New Jersey.
 John J. Voorhees, Voorhees Rubber Manufacturing Co., Jersey City, New Jersey.
 SECRETARY: J. E. Tucker, United States Rubber Co., 1790 Broadway, New York City.

MEDICAL RUBBER GOODS AND SUNDRIES DIVISION.

A. W. Warren, chairman, Hodgman Rubber Co., Tuckahoe, New York.
 W. O. Rutherford, vice-chairman, The B. F. Goodrich Co., Akron, Ohio.
 W. S. Davison, The Miller Rubber Co., Akron, Ohio.
 Charles J. Davol, Davol Rubber Co., Providence, Rhode Island.
 S. H. Jones, United States Rubber Co., 1790 Broadway, New York City.
 F. H. Jones, Tyer Rubber Co., Andover, Massachusetts.
 T. W. Miller, Faultless Rubber Co., Ashland, Ohio.
 E. J. Schutz, Rubber Products Co., Barberton, Ohio.
 O. O. Williams, Seamless Rubber Co., New Haven, Connecticut.
 SECRETARY: J. Russell Parker, Parker, Stearns & Co., 288 Sheffield avenue, Brooklyn, New York.

PNEUMATIC TIRE DIVISION.

G. M. Stadelman, chairman, The Goodyear Tire & Rubber Co., Akron, Ohio.
 E. H. Broadwell, vice-chairman, The Fisk Rubber Co., Chicopee Falls, Massachusetts.
 J. E. Baum, Empire Rubber & Tire Co., Trenton, New Jersey.
 J. S. Broughton, United & Globe Rubber Manufacturing Cos., Trenton, New Jersey.
 O. R. Cook, Kelly-Springfield Tire Co., 1614 Prospect avenue, Cleveland, Ohio.
 W. W. Duncan, Hood Tire Co., Watertown, Massachusetts.
 Seneca G. Lewis, Pennsylvania Rubber Co., Jeannette, Pennsylvania.
 H. L. McClaren, Ajax Rubber Co., Inc., 1796 Broadway, New York City.
 W. O'Neil, General Tire & Rubber Co., Akron, Ohio.
 W. O. Rutherford, The B. F. Goodrich Co., Akron, Ohio.
 J. W. Thomas, Firestone Tire & Rubber Co., Akron, Ohio.
 O. L. Weaver, Star Rubber Co., Akron, Ohio.
 SECRETARY: J. C. Weston, United States Tire Co., 1790 Broadway, New York City.

RAILWAY SUPPLIES DIVISION.

H. E. Raymond, chairman, The B. F. Goodrich Co., 1780 Broadway, New York City.
 J. H. Kelly, vice-chairman, Hewitt Rubber Co., Buffalo, New York.

I. R. Bailey, The Goodyear Tire & Rubber Co., Akron, Ohio.
 J. S. Broughton, United & Globe Rubber Manufacturing Cos., Trenton, New Jersey.
 J. H. Cobb, New York Belting & Packing Co., 91 Chambers street, New York City.
 C. A. Daniel, Quaker City Rubber Co., Philadelphia, Pennsylvania.
 H. M. Green, Manhattan Rubber Manufacturing Co., Passaic, New Jersey.
 George E. Hall, Boston Woven Hose & Rubber Co., Boston, Massachusetts.
 J. A. Lambert, Acme Rubber Manufacturing Co., Trenton, New Jersey.

 Thomas F. Walsh, Swinchart Tire & Rubber Co., Akron, Ohio.
 C. J. Welch, United States Rubber Co., 1790 Broadway, New York City.

PLAN OF ORGANIZATION AND PROCEDURE OF DIVISION COMMITTEES.**ORGANIZATION.**

The War Service Division Committees shall be representative of each branch of manufacture of the rubber industry, and shall be designated by such name or title as the Central Committee may determine.

Special committees may be appointed by the Central Committee to undertake any particular work for the benefit of the industry as a whole or any part thereof.

Appointment to membership on a Division Committee shall be made by the Central Committee.

Each Division Committee shall have a chairman and a vice-chairman, who shall be appointed by the Central Committee.

PERSONNEL.

Each Division Committee, with the exception of special committees heretofore mentioned, should be fully representative of the branch of the industry which it serves, and should include in its membership as far as possible representation of large, medium and small concerns.

The number of members on each committee shall be limited to fifteen, but should be no greater than is necessary to make it fully representative.

Any member of a Division Committee who may not be able to attend a meeting shall send as an alternate some one from his organization fully qualified to represent and act for him.

Each member of a Division Committee may have the privilege of bringing to any meeting a representative of his firm (either technical or commercial), or in his absence may send two representatives, one of whom shall be qualified to act for him as noted

in preceding paragraph, but in no event shall the member or his alternate have the power to cast more than one vote.

Acceptance of membership on any Division Committee shall be considered as carrying with it an obligation to attend committee meetings whenever held (or to send a qualified alternate), to serve unselfishly and to make whatever sacrifices are necessary for the common good.

Division Committee members should be selected from those who are associated with the concerns with whom they are connected in an official capacity when possible.

MEETINGS.

Meetings of Division Committees may be called by the Central Committee; by the Division Chairman, or in his absence by the vice-chairman, or through a request to the chairman in writing by three members.

PROCEDURE.

At all Division Committee meetings, full and complete minutes should be kept of the proceedings for a permanent record. A copy of such minutes should be promptly forwarded to each member of the Division, to the secretary and to each member of the Central Committee.

For the purpose of coordinating the various Divisions of the War Service Committee and to prevent conflict, Division Committees should submit to the Central Committee for approval:

(a) All questionnaires before submitting them to the trade at large.

(b) Any general communications to the trade or the Divisions regarding recommendations for the industry, and

(c) All actions taken by Division Committees should be submitted to the Central Committee for approval before becoming operative.

A brief but complete record of all actions taken at each Division Committee meeting should be promptly sent out to all concerns in the industry which the Committee represents as a "Recommendation to the Central Committee."

In view of the number of Division Committees which will hold meetings at approximately the same time, it will be physically impossible for the Secretary of the War Service Committee to attend all these meetings. Therefore, each Division Committee shall appoint a permanent secretary, who shall keep all minutes and records.

As it has been determined that there shall be no *ex-officio* representative of the Central Committee on any of the Divi-

sion Committees, the chairman of each Division Committee shall give proper notice to the War Service Committee, 52 Vanderbilt avenue, New York City, of the time and place of all Division Committee meetings, in order that each member of the Central Committee may be notified and may attend such meetings if he so desires, it being the desire of the Central Committee that its members may be in as close touch as possible with the work of the various Division Committees.

Each Division Committee shall prepare, with the assistance of the Secretary of the War Service Committee, a list of the concerns whom it represents, and a proper mailing list should be in the possession of each division chairman and secretary, as well as in the New York and Washington offices.

LABOR PRIORITY BULLETIN.

The Committee notified all rubber manufacturers on September 30, that the following bulletin just received from the Priorities Division, War Industries Board, Washington, District of Columbia, was forwarded by the Department of Labor on the 26th instant to all District Boards:

WAR INDUSTRIES BOARD, PRIORITIES DIVISION, WASHINGTON.

LABOR PRIORITY BULLETIN NO. 2.

To United States Employment Service and All Industrial Advisers:

You are notified that the rubber manufacturers of the country have reached an agreement with the Priorities Division of the proper control by the War Industries Board. The Priorities Division, deeming the remaining production to be essential, and the industry as a whole under said curtailed program to be entitled to general preferential treatment, has certified it under the designation "Rubber-plants engaged principally in manufacturing rubber products," upon Preference List No. 2, giving it a rating of Class IV.

We ask that the Industrial Advisers bring this bulletin to the attention of the District Boards for their information."

EDWIN B. PARKER,
Priorities Commissioner.

WASHINGTON, D. C., September 21, 1918.

Should any manufacturer have difficulty through the failure of the District Board to recognize the classification of the industry on the preference list, he should wire details to the secretary of the War Service Committee of the Rubber Industry, 808 Colorado Building, Washington, District of Columbia, who will immediately take the matter up with the proper governmental department.

REGULATIONS GOVERNING THE PRODUCTION OF RUBBER PRODUCTS, ISSUE NO. 1, OCTOBER 1, 1918.

Although these regulations have been revised by the War Service Committee they are published as a matter of record. The new regulations will be found on page 74 of this issue.

THE regulations governing the production of rubber products, dated October 1, were distributed to the rubber industry by the Committee on October 8, with the suggestion that each manufacturing concern deputize some one in its organization to pass on all orders received and make application to the War Industries Board through the War Service Committee for approval or rejection of all orders for articles which may be doubtful, or have not been definitely approved.

The regulations that follow are supplemental to War Industries Board Circular No. 24. (See THE INDIA RUBBER WORLD, October 1, 1918, page 12) and superseding War Service Committee letter of September 23, governing production for the October-December period, 1918. (See THE INDIA RUBBER WORLD, October 1, 1918, page 14.)

The War Industries Board has instructed the War Service Committee of the Rubber Industry to issue the following regulations for the purpose of defining the control program outlined in Circular No. 24 Priorities Division of the War Industries Board.

The production of all rubber products will be controlled under four general classifications as to articles and their use, as follows:

CLASS I.

Articles to be supplied on direct orders received from the following sources:

- Governmental departments.
- Government-controlled railways.
- Government-controlled express companies.
- Government-controlled telephone companies.
- Government-controlled telegraph companies.
- The American Red Cross.
- Allied Governments (Official).

CLASS II.

Articles to be supplied for use in industries approved by the War Industries Board. These industries comprise, first, those at present listed, or to be listed on preference lists issued or to be issued by the Priorities Division of the War Industries Board, and, second, those which, while not so listed, are adjudged or

to be adjudged by the Priorities Division of the War Industries Board as more or less essential and permitted to operate in whole or in part.

CLASS III.

Articles for general use.

CLASS IV.

Articles considered by the War Industries Board to be *non-essential*.

GENERAL INSTRUCTIONS.

As it is obviously impossible to prepare at one time lists of articles or industries which are complete, the lists herein published are subject to revision from time to time by additions or reductions.

The volume or quantity of production when not specifically limited to a definite amount must in no case exceed the normal current demand, and it is *incumbent upon manufacturers to satisfy themselves* that stocks do not accumulate, either with themselves, their dealers, jobbers or distributors, or ultimate consumers.

These regulations supersede War Service Committee letter of September 23, 1918, and are supplemental to Circular No. 24 issued by the Priorities Division of the War Industries Board, and the spirit of that circular is to be appreciated and followed in applying the regulations and restrictions herein contained.

After receipt of this notice no article shall be produced, except as herein provided, until a ruling has been obtained. Manufacturers producing articles other than those listed should immediately request rulings upon the classifications under which they may or may not be produced.

The above paragraph is modified to the extent that goods in process of manufacture may be completed to prevent actual loss. Goods in process, however, do not include compounds which may be on hand especially prepared for specific purposes. These compounds should be worked over for the production of essential articles. The control of production applies equally to orders or commitments which may be in hand. Orders on hand for non-essential articles may either be cancelled or held in abeyance subject to further instructions from the War Industries Board.

Forms for use in making applications for classifications of articles or uses will be supplied by the War Service Committee upon request, stating number required. (Address, 52 Vanderbilt avenue, New York City.) These applications should be made out in triplicate and forwarded to the War Service Committee of The Rubber Industry, 808 Colorado Building, Washington, D. C. A ruling will then be obtained from the War Industries Board and transmitted to the applicant.

Export—The pledge provided in paragraph 10, Circular 24, is not required to cover export shipments, but manufacturers are required to satisfy themselves that shipments are to be exported by personal inspection of export license.

CONTROL OF PRODUCTION FOR VARIOUS CLASSES.

CLASS I.

Production of all rubber products for the Government is limited only by orders in hand except that all rulings of the Conservation Division of the War Industries Board apply to this class unless a special exception is made by the Rubber Section of the War Industries Board.

Crude rubber consumed will be replaced in full under War Trade Board plan "A" Allocation. (See THE INDIA RUBBER WORLD, October 1, 1918, page 13.)

CLASS II.

Sufficient production of articles in this class is authorized to supply essential requirements of those engaged in industries on the preference list of the War Industries Board designated as Division "A," and individual manufacturers who have been given preferential treatment designated as Division "B."

These lists will be revised from time to time according to decisions of the War Industries Board. Applications may be made as hereinbefore provided for rulings covering either industries or individual concerns.

REGULATIONS GOVERNING THE PRODUCTION OF RUBBER PRODUCTS, ISSUE NO. 2, NOVEMBER 1, 1918.

THESE regulations are supplemental to War Industries Board Circular No. 24 and supersede War Service Committee letter of September 23, 1918, and Regulations Governing the Production of Rubber Products, Issue No. 1, October 1, 1918.

Issue No. 1 of Regulations Governing Production of Rubber Products, dated October 1, 1918, provided for classification of both uses and articles. Since that date the War Industries Board has ruled that the main control shall be through articles, inasmuch as uses will be largely regulated by the Board. There will be a number of exceptions to this general rule where certain articles are considered essential for some purposes and non-essential for other purposes. In determining the essential character of articles the War Industries Board endeavors wherever possible to consider the needs of the producers of the articles as well as the necessity for the articles themselves. The new ruling creates a much simpler form of control, but at the same time places a greater responsibility upon the industry.

Under the new ruling former Class II is eliminated, leaving only Classes I, III and IV, which will now be known as Classes I, II and III.

Class I remains as direct government orders.

Class II becomes a list of articles which may be produced in accordance with the following regulations:

First.—Articles which may be produced in sufficient quantities to meet current needs. (These articles are listed without comment.)

Second.—Articles the production of which is curtailed and which may be produced only to the extent indicated.

Third.—Articles which may be produced only for specific purposes or uses. (See page 75.)

Class III now becomes a list of articles the production of which is prohibited. Under this class are also listed articles which may not be produced for specific purposes even though the production of the same articles is allowed under Class II for other specific purposes. (See page 76.)

The War Industries Board has instructed the War Service Committee of the Rubber Industry to issue the following regulations for the purpose of defining the control program outlined in Circular No. 24 Priorities Division of the War Industries

Board. (See page 12, THE INDIA RUBBER WORLD, October 1, 1918.)

The production of all rubber products will be controlled under three general classifications as to articles and their uses described and listed in the following pages:

1. These regulations supersede all previous regulations, including War Service Committee letter of September 23, 1918, and Issue No. 1 Regulations dated October 1, 1918, and are supplemental to Circular No. 24 issued by the Priorities Division of the War Industries Board, and the spirit of that circular is to be appreciated and followed in applying the regulations and restrictions herein contained.

2. Manufacturers are cautioned to exercise great care in the production of articles permitted for specific uses, and to obtain rulings whenever the proposed use is not specifically authorized or is not perfectly clear.

3. After November 11, 1918, no article shall be produced except as herein provided until a ruling has been obtained. Manufacturers producing articles other than those listed should immediately request rulings upon the classifications under which they may or may not be produced.

4. The above paragraph is modified to the extent that goods in process of manufacture may be completed to prevent actual loss. Goods in process, however, do not include compounds which may be on hand especially prepared for specific purposes. These compounds should be worked over for the production of essential articles. The control of production applies equally to orders or commitments which may be in hand. Orders on hand for non-essential articles may either be cancelled or held in abeyance subject to further instructions from the War Industries Board.

5. The volume or quantity of production when not specifically limited to a definite amount must in no case exceed the normal current demand, and it is incumbent upon manufacturers to satisfy themselves that stocks will not accumulate, either with themselves, their dealers, jobbers or distributors, or ultimate consumers.

6. As it is obviously impossible to prepare at one time complete lists of articles, the lists herein are subject to revision from time to time by additions or reductions.

7. Forms for use in making applications for classifications of articles or states will be supplied by the War Service Committee upon request, stating number required. (Address, 52 Vanderbilt avenue, New York City.) These applications should be made out in triplicate and forwarded to the War Service Committee of the Rubber Industry. A ruling will then be obtained from the War Industries Board and transmitted to the applicant.

8. Export.—The pledge provided in Paragraph 10, Circular No. 24, is not required to cover export shipments.

All articles may be produced for export, including articles listed in Class III, but in cases where the production is curtailed the total amount produced for both domestic and export business must not exceed the amount indicated. Manufacturers are required to satisfy themselves that shipments are to be exported by personal inspection of export licenses.

9. The articles listed in Classes II and III are arranged in alphabetical order with the exception of general groupings such as hard-rubber goods, molded goods, etc. Caution should therefore be exercised to look for articles under the groupings if not found in the general list.

10. Articles already made and in stock which are non-essential may be sold.

Articles already made and in stock used for both essential and non-essential purposes may be sold for essential purposes only.

CONTROL OF PRODUCTION FOR VARIOUS CLASSES.

CLASS I.

Articles to be supplied on direct orders received from the following sources:

- Governmental departments.
- Government-controlled railways.
- Government-controlled express companies.
- Government-controlled telephone companies.
- Government-controlled telegraph companies.
- The American Red Cross.
- Allied Governments (Official).

Production of all rubber products for the above is limited only by orders in hand except that all rulings of the Conservation Division of the War Industries Board and Provisions of Class III apply to this class unless a special exception is made by the Rubber Section of the War Industries Board.

Crude Rubber consumed will be replaced in full under War Trade Board plan "A" Allocation. (See page 13, THE INDIA RUBBER WORLD, October 1, 1918.)

CLASS II.

Articles which may be produced in accordance with the following regulations and in accordance with regulations promulgated by the Conservation Division of the War Industries Board.

FIRST.—Articles which may be produced in sufficient quantities to meet current needs. (These articles are listed without comment.)

SECOND.—Articles the production of which is curtailed and which may be produced only to the extent indicated.

THIRD.—Articles which may be produced only for specific purposes or uses.

Where the production of any article is expressly curtailed on a percentage basis, the requirements of Class I may be supplied in addition to the restricted amount arbitrarily fixed.

Attention is called to the fact that there are a number of articles listed in Class II without restriction, which would have been restricted were it not for the fact that the Priorities Division has already regulated the industries using these articles, so the demand will automatically be curtailed.

MEETINGS AND COMMUNICATIONS OF THE RUBBER ASSOCIATION OF AMERICA, INC.

The following letter, dated October 5, was sent to all rubber manufacturers, importers and dealers:

The Executive Committee of The Rubber Association of America, Inc., at a meeting held on Friday, October 4, 1918, passed the following resolutions upon the recommendation of the War Service Committee of the Rubber Industry of the U. S. A.:

WHEREAS, the expenses of the War Service Committee of the Rubber Industry have been greatly increased because of the requirements of the Government in connection with the regulations of the War Industries Board and the War Trade Board, and,

WHEREAS, the revenue of The Rubber Association of America, Inc., has materially decreased because of curtailed importations of crude rubber and new methods of packing which have increased the weight per package;

THEREFORE, BE IT RESOLVED that it is the sense of the Executive Committee that the charge for the Rubber Association services in connection with recording guarantees, entering, storing, etc., should be based upon the weight of crude rubber instead of the number of packages, and that the rate be fixed at 10 cents per 100 pounds, and that the same be effective on and after October 10, 1918, and be it also

RESOLVED that the Executive Committee shall continue to administer the funds as economically as possible, always having in mind efficiency as the main consideration for the success of the rubber industry.

In a letter dated October 11, manufacturers, importers and dealers were informed as follows:

Supplementing our letter of October 5 last in regard to the charges for the Rubber Association services in connection with the importation of crude rubber and kindred products, please be advised that all charges will be based on net weight. The charges also will be made on crude rubber and kindred products invoiced on and after October 10, 1918, regardless of when the merchandise was purchased or shipped.

The charge for balata and gutta percha will be the same as for crude rubber, viz.: 10 cents per 100 pounds.

The charge in connection with the importation of gutta siak and pontianak will be five cents per 100 pounds.

SALES OF FREE RUBBER AND ALLOCATION CERTIFICATES.

Manufacturers, importers and dealers were notified by the Committee on Rubber and Kindred Products, on October 9, that the following communication had been received from the War Trade Board:

WAR TRADE BOARD,
WASHINGTON, D. C.

October 8, 1918.

The Rubber Association of America, Inc.,
2 Vanderbilt Avenue,
New York City.

Gentlemen:

Obviously it is important that necessary steps be taken to insure a proper distribution of free rubber now in this country in dealers' and manufacturers' hands or in transit, in order to assure a necessary supply for essential products and to prevent an accumulation of abnormal stocks.

To this end you are requested to immediately inform all importers, dealers and manufacturers, that hereafter all proposed sales of free rubber and all proposed sales of allocation certificates are to be submitted to the Bureau of Imports of the War Trade Board for approval before being consummated.

A form upon which proposed sales may be reported to the Bureau of Imports for approval is attached hereto.

FRED B. PETERSON,
Director.

It is understood by the Committee that the object of this new regulation is to assure, as far as possible, equitable distribution and control of the existing stocks of "free" rubber and such

rubber represented by allocation certificates that manufacturers might desire to dispose of to the end that large individual accumulations may be prevented.

Therefore, after this date, all sales, as noted, must have the approval of the Bureau of Imports before being consummated.

We are advised by the Bureau of Imports that they are in a position to pass upon these applications promptly, but that approval will only be considered upon receipt of form executed in duplicate, containing the necessary particulars. They therefore request that no application be made by telephone, but solely upon the form prescribed. Supplies of these forms can be secured upon application to The Rubber Association of America, Inc.

MEETING OF THE BOARD OF DIRECTORS.

The Board of Directors and the Executive Committee held a meeting at the Union League Club, New York City, on October 24. Those present were Bertram G. Work, chairman, Harry F. Dunn, J. Newton Gunn, Homer E. Sawyer, Charles A. Daniel, John S. Lowman, Charles T. Wilson, William J. Kelly, Charles J. Davol, John A. Lambert, former presidents George B. Hodgman, Harvey S. Firestone and secretary Harry S. Vorhis.

The meeting was devoted to deliberation on matters of moment to the rubber industry and important decisions were made, one of which was to form a Crude Rubber Division to be composed of firm members. William J. Kelly, chairman *pro tem* of the Outing Committee, in charge of the Second Annual Golf Tournament, reported a balance of \$627 that will be donated to the Smoke Fund.

EXECUTIVE COMMITTEE MEETING.

The Executive Committee elected the following firm members:

FIRM MEMBERS AND REPRESENTATIVES.

The Ravenna Rubber Co., S. K. Elliot, Ravenna, Ohio.
Midcontinental Tire Manufacturing Co., S. B. Wallingford, Wichita, Kansas.

International India Rubber Corp., George W. Odell, South Bend, Indiana.

The Long-Wear Rubber Co., F. W. O'Brien, Elyria, Ohio.
The Lion Tire & Rubber Corp., Thomas Follen, La Fayette, Indiana.

Weldon Roberts Rubber Co., Weldon Roberts, Newark, New Jersey.

The Worthington Ball Co., George C. Worthington, Elyria, Ohio.

Paul Bertuch, Paul Bertuch, 25 Beaver street, New York City.
MacDonald & Co., F. L. W. MacDonald, 454 Montgomery street, San Francisco, California.

Albert V. W. Tallman, Albert V. W. Tallman, 54 Stone street, New York City.

Joosten & Janssen, E. Janssen, 25 William street, New York City.

Sioux City Tire & Manufacturing Co., Charles F. Sawyer, Sioux City, Iowa.

Sampson Tire & Rubber Corp., William MacKay, 318 Van Nuys Building, Los Angeles, California.

Hagemeyer & Brunn, E. M. Brunn, 82 Beaver street, New York City.

The Armstrong Rubber Co., Inc., George F. Armstrong, Garfield, New Jersey.

National Standard Co., W. F. Harrah, Niles, Michigan.

MANUFACTURER'S PLEDGES IN ABEYANCE.

All rubber manufacturers were notified on October 26, 1918, as follows:

The question of pledges required by the Priorities Division of the War Industries Board is at present under consideration with a view to certain modifications. Until the matter has been definitely settled and until you are further advised, you may hold in abeyance all action previously required in relation to pledges.

Applications of Catalysis to Vulcanization.

By André Dubosc.

CAOUTCHOUCS contain besides pure gum a certain number of impurities of which the characteristics are:

1. Saponifiable or unsaponifiable resins with or without rotatory power.

2. Nitrogenous substances in which, besides the proteins isolated by Spence, we find enzymes the oxidizing action of which on the gum, in the presence of air, causes tackiness and destruction.

These substances, for a long time, have been considered injurious and attempts have been made, by washing and otherwise to eliminate them as completely as possible.

The production of chemically pure synthetic rubbers from isoprene revealed the impossibility of properly vulcanizing them and gave rise to the thought that the proteins and the resins which were lacking were essential in effecting vulcanization.

The same negative results were obtained with plantation gums from which, either during coagulation or by intensive washing, all foreign matters had been removed.

It therefore seemed quite important to allow a certain quantity of resins and proteins to remain in the gum so as to free the gum from destructive enzymes.

Following Weber's researches the importance of the proteins in rubber was suspected but their action was considered more physical than chemical, something like the action that Seligmann attributed to the elastic matter of caoutchouc.

On the basis of microscopic analysis, in which the proteins, dyed black by silver salts, are easily visible, Biffin maintained that they play an important part in coagulation, forming a network surrounding globules of pure gum.

Franck, after numerous experiments on *Hevea* latex, shared this opinion.

Other scientists, however, have shown that the proteins are not indispensable in obtaining a good coagulum from the latex.

Jong and Tromp de Haas, for instance, easily obtained the coagulation of the latex of *Castilleja* after removing the proteins by alcohol.

Spence and Crossly obtained perfect coagulation with latex considerably diluted with water, in which the proteins could not coagulate at the same time as the caoutchouc.

Victor Henry Zimmermann, after microscopic examination concluded that the coagulation of the gum can take place when the proteins are not present.

Barrett declared that in the coagulation with acetic acid, as practiced in plantations, there are two phases, one rich and the other poor in proteins, and that in both phases coagulation goes on equally well.

All these studies dealt only with the physical part played by proteins and neglected their chemical effect, which is much more important.

The first observations along these lines were made by Lock and Bamber.

These scientists, studying the physical constants of purified plantation gums after vulcanization, found that the resistance to breaking of these caoutchoucs was in inverse ratio to their pure gum contents.

The importance of resins and proteins during the vulcanization was then indicated for the first time.

The part they play has been still more clearly described by Beadle and Stevens, and Lothar Weber, at the Congress of Applied Chemistry at New York, in 1912.

From their studies it results:

1. That a caoutchouc, completely free from resin after pro-

longed extraction by alcohol, does not vulcanize and that a minimum of three per cent of resin is necessary for vulcanization to take place.

2. That a caoutchouc, after losing its proteins, vulcanizes very poorly and very slowly; that its breaking strength, compared with an ordinary piece of caoutchouc, is reduced from five to one; and that the coefficient of vulcanization drops from 3.62 to 1.15.

Beadle and Stevens also established other facts of importance, viz.: that if one augments artificially the protein contents or those of nitrogenous matter in a mass of caoutchouc, vulcanization takes place more rapidly, the physical constants, particularly the breaking strength, are increased, and the coefficient of vulcanization becomes higher.

These valuable observations showed conclusively the chemical importance of resins and proteins in vulcanization, as accelerators and vitalizers. Their action is probably catalytic, for, although they clearly stated their results, neither Beadle and Stevens, nor Lothar Weber furnished any explanations.

Later work, done by Eaton and Grantham and published by them last July, has not only confirmed, but has shown the increasing importance of the part played by the proteins and by the resins in the vulcanizing process.

Eaton and Grantham have shown that, under the action of anaerobic bacteria, the proteins of caoutchouc are transformed into a substance which they have not isolated, but which, during vulcanization, diminishes the curing time, acting as an accelerator, and improves the physical constants, acting as a vitalizer. In the presence of antiseptics such as formaline, the bacterial transformation does not take place and acceleration does not occur, although there is a slight increase of the physical constants, which we shall explain later on. The same negative result is found if the caoutchouc is sterilized by steam or by freezing, which is easily explained by the fact that the microbic action on the protein is prevented. When acting similarly on other proteins, such as casein or the peptones, and the proteins precipitated from the serum, results are obtained which, though not identical, resemble acceleration and vitalization.

But it must be remarked that the results obtained are not dependent on the amount of nitrogen in the caoutchouc, and that a sample containing much nitrogen often behaves much worse than another containing considerably less. This is easily explained if we note that the nitrogen can react only under certain conditions determined by the microbic action.

This can all be understood very clearly by referring to the writings of Effront on the action of the proteins and of the diaminated acids under the influence of bacteria or rather of enzymes, which writings were probably unknown to Eaton and Grantham.

The principle announced by Effront is that if one causes the reaction, under proper conditions, of an enzyme or a diastase on a protein, it is divided into fat acids on the one hand and into amines or ammonium compounds on the other. Remembering the studies of Spence, we know that the protein of caoutchouc exists as a conjugated protein, probably a glycoprotein, which by hydrolysis, changes into glycosamine. It is almost certain that it is this substance which originates in the reactions pointed out by Eaton and Grantham, and that it reacts as an accelerator and a vitalizer.

These reactions are therefore due to an amine or to an aminated body, a valuable observation which allows us to understand the chemistry of the reactions to which we have referred.

These facts having been stated and the action of the resins and the proteins, in the vulcanization, having been established, let us examine successively the reactions which are produced when we cause sulphur, at the temperature of vulcanization (135 degrees C.), to react on these two substances.

The resins of caoutchouc are present as ethers of cholesterol, acetates of alpha and beta amyrine, acetate of lupeol, that is to say as ethers resulting from the action of a fat acid, acetic acid, on a secondary alcohol, the cholesterol. Under the influence of heat these ethers tend to decompose and the molecule of cholesterol, very complex, tends to split, giving rise to less complex products. This change takes place, as we can verify in the heating of the resins of jelutong, with an abundant liberation of hydrogen and acetylene.

At the temperature of vulcanization, this decomposition is only partial, but the quantity of hydrogen produced is sufficient, in the presence of sulphur, at 135 degrees C., to form considerable sulphydric acid. This reaction was noticed by one of the discoverers of vulcanization, Hancock, and confirmed by Payen, who mentioned it carefully in his studies on caoutchouc.

If, therefore, we study the action of resins on sulphur in glass, at the temperatures of vulcanization, we find that the result is the formation of sulphydric acid in abundant quantity. We shall see later what part this sulphydric acid can play in vulcanization.

The proteins of caoutchouc, isolated for the first time by Spence, appear as conjugated proteins, muscines or glucoproteins, which have been studied by Schmiedberg. They are formed by the union of a carbohydrate with an amine after the fashion of the amino acids, and by hydrolysis, under the action of the enzymes which always accompany it, they can be hydrolyzed, producing glucosamines:

If we prepare the protein of caoutchouc by the method of Spence and Kratz by dissolving crude gum in benzene in the presence of trichloroacetic acid, and then submit the product thus obtained to enzymic action, either with the enzymes of caoutchouc, or with the amylase of Effront, we obtain a substance which behaves, in vulcanization, as the fermented proteins of Eaton and Grantham do and which, when analyzed, presents all the characteristics of glucosamine.

It combines with the isocyanate of phenyl, giving a substance which melts at 211 degrees C. With the phenylhydrazine, it gives a glucosazone, and with hydroxylamine a glucosamine oxime melting at 122 degrees C. Bromine water oxidizes it into glucosamic acid, and nitric acid into isosaccharic acid.

If we take this substance, which is only the product of the transformation of the protein under enzymic action in the caoutchouc, and heat it with sulphur, to the temperature of vulcanization, 135 degrees C., we shall find that it gives rise to:

1. Sulphydric acid;
2. Sulphocyanic acid.

The equation can be written as follows:

Sulphydric acid is easily identified by acetate of lead and nitroprussiate of sodium, sulphocyanhydric acid by perchloride of iron and the protosalts of copper, which give an insoluble precipitate of sulphocyanate of copper.

Thus the action of resins and proteins on sulphur, at the temperature of vulcanization, forms sulphydric acid and sulphocyanic acid.

The formation of this last substance need not astonish us, for it always is formed when sulphur, nitrogenous products and

derivatives of coal are heated together, as in the destructive distillation of coal which contains nitrogen, sulphur and carbon. It is produced also to a considerable extent in the wash waters and in the materials used in purifying illuminating gas, not unlike sulphydric acid.

How can these two substances, which are surely formed by the action of sulphur at 135 degrees C. on a caoutchouc containing a normal quantity of resins and of proteins, produce rapid vulcanization of the gum, increase its resistance to rupture and its polymerization?

Let us examine successively the cases of these two acids.

Harries has recently shown, bringing the theories of Weber and of Oswald into agreement, that vulcanization takes place in two phases: the first one, a phase of adsorption, in which the sulphur is extractable by acetone, but in which the caoutchouc passes from the metastable form to the stable form, characterized by the insolubility of its chlorhydrate in chloroform; then, a second phase, the chemical one, in which the adsorbed sulphur combines with the gum, giving a sulphide of polypropylene and becoming unextractable by acetone.

Remembering the principles of colloidal chemistry, sulphur to be adsorbed by a colloid, such as caoutchouc, must itself be in a colloidal state, S_2 , but it is introduced into the mixture to be vulcanized in a polymeric state, S_8 ; therefore, our first task must be to break up its aggregate and bring it to a colloidal state.

Under the influence of heat, this transformation takes place, but slowly and in proportion to the means to be acted on. That is why we can reduce the time necessary for vulcanization by increasing the quantity of sulphur used.

Sulphydric acid, produced by the reactions of the resins and the proteins on the sulphur enables us to obtain colloidal sulphur much more easily.

If we heat sulphur in the presence of air, or of a substance containing oxygen, such as an oxidized caoutchouc or a metallic oxide, we produce sulphurous acid and the sulphide corresponding to the oxide used; it is the reaction which is constantly used in vulcanization with litharge or with oxide of magnesia, both of which are excellent accelerators.

The reactions are produced under the following equations.

The reaction is produced more or less rapidly according to whether the thermic equation, corresponding to the chemical equation, is positive or negative.

With litharge the equation is exothermic and produces +202 calories, the reaction is very rapid and the acceleration is highly accentuated.

With magnesia, the equation is endothermic and requires the addition of 328 calories, but this fault is compensated for by the considerable quantity of occluded air which light magnesia contains. It is to this occlusion that this substance owes its accelerating power.

With oxide of zinc the reaction is clearly endothermic, and as this substance contains little or no occluded air, it remains a simple charge and has no accelerating action.

The same is the case with most of the metallic oxides whose thermic equation is negative, in the case of formation of sulphurous acid.

In presence of sulphydric acid, the sulphurous acid thus produced reacts in the production of colloidal sulphur and of water.

It is the classical reaction which is applied constantly in the purification of illuminating gas.

The formation of colloidal sulphur adsorbable by caoutchouc is thus explained, its rapidity of formation being the function of the rapidity of formation of sulphurous acid.

On the other hand, we must not forget that sulphydric acid

and sulphurous acid are gases; they therefore obey the laws of Graham and diffuse through the mass of caoutchouc with a rapidity which is inversely proportional to the square root of their densities.

The reaction of formation of the colloidal sulphur, which results from their reciprocal action, is produced not on the surface but in the whole mass of the caoutchouc. Now, the adsorption, first phase of the vulcanization, is the more rapid the better the sulphur is mixed in the mass. We can easily understand that, under conditions similar to those which we have described, the adsorption would take place very rapidly and an

acceleration of vulcanization would take place as a result.

As has been shown by these summary notes, the presence of resins in virgin caoutchouc results in rendering easier and more rapid the formation of adsorbable colloidal sulphur, the formation of which is very slow under the influence of heat alone.

The resins accelerate vulcanization, as litharge does; it transforms polymeric sulphur into sulphurous acid, they transform it into sulphydric acid, diffusible gases which, reacting one on the other in the interior of the mass of gum, produce adsorbable colloidal sulphur, the only sulphur that can vulcanize caoutchouc.

(To be continued.)

What the Rubber Chemists Are Doing.

DEVULCANIZATION OF CAOUTCHOUC BY HEXAMETHYLENE TETRAMINE.

AN interesting experimental demonstration of the devulcanization of caoutchouc by formation of hexamethylene tetramine in the gum is described by André Dubosc in "La Caoutchouc et la Gutta-Percha," August 15, 1918, of which the following is an abstract.

Previous experiments have shown that hexamethylene tetramine is capable, under proper conditions of quantity and pressure, of removing sulphur chemically combined with caoutchouc.

In the present demonstration advantage was taken of the fact that caoutchouc is easily penetrated by gases.

A sample of vulcanized caoutchouc was reduced to 100 mesh and by prolonged acetone extraction all free sulphur was removed; extracted with cold ammonium sulphide and thoroughly washed; extracted with chloroform and with alcoholic potash followed by washing with 95 per cent alcohol so as to remove all faticies which contain combined sulphur. The sample thus prepared being successively treated alternately with ammonia gas and formaldehyde gas, the formation first of trimethylene triamine was effected with liberation of water vapor and heat. This body having been formed, the caoutchouc was made to absorb a fresh quantity of ammonia to the point of saturation, followed by absorption of more formaldehyde gas. Pentamethylene tetramine was thus formed, also a certain quantity of water vapor and rise of temperature resulted. Then ammonia gas was again absorbed in excess followed by formaldehyde. The combination between the two gases and the pentamethylene tetramine produced by the preceding reaction took place almost immediately with evolution of heat, and hexamethylene tetramine was formed. The caoutchouc noticeably increased in volume, and gained practically 12.75 per cent in weight.

The rubber was next subjected in an autoclave for six hours to steam pressure at seven atmospheres. Following this the rubber was washed and sheeted until perchloride of iron gave no reaction of sulphocyanic acid. On a sample dried at 100 degrees C. the combined sulphur was determined by the Henriques-Bertrand method. Before treatment the rubber showed 2.723 per cent combined sulphur; after treatment, 2.478 per cent, or a loss of 92.104 per cent of the combined sulphur.

VULCANIZATION RESEARCHES.

Vulcanization experiments, carried out during the last quarter of 1917 in the Department of Agriculture, Federated Malay States, as reported by B. J. Eaton, resulted as follows:

The retardation of vulcanization caused by an excess of acetic acid in the case of slab is comparable with the results obtained with crepe, namely, very little.

Sodium bisulphite slightly retards the rate of cure of both crepe and slab. The use of sodium bisulphate in slab is to obtain a pale-colored, rapidly curing rubber, superior in tensile properties to ordinary pale crepe. This cannot be effected by allowing the coagulum to mature in the open, since darkening occurs.

probably on account of the large amount of oxidizable substances and the greater amount of oxidizing enzyme remaining in the slab.

Since the researches carried out by the writer have shown the presence of vulcanization accelerators to be actually present in latex and retained in the raw rubber under certain conditions of preparation, in addition to those formed by the decomposition of the proteins in the maturation of slab and rolled up wet sheet, etc., it was considered advisable to ascertain whether these accelerators were removed to any extent when the matured slab was subsequently creped and dried. Experiments were therefore carried out in which the matured slab was cut up into thin worms and air-dried and subsequently mixed directly with sulphur for vulcanization. Comparative samples of matured slab were converted to crepe and dried.

Little or no difference was obtained between the rate of cure of the slab cut into worms and dried and that converted into crepe, which shows that little or none of the vulcanizing accelerators is removed by the normal washing and creping of the matured slab. In fact, the creped slab in each series of the experiment vulcanized slightly more rapidly than the "wormed" slab. It was observed that a certain development of "spot" disease occurred invariably in the "wormed" slab (after worming), due to the exposure to the air combined with the slow drying of the worms, and this may have been responsible for the slightly retarded cure, since the writer has shown previously that the organisms causing "spot" disease retard the rate of cure of a fast-curing rubber.

The rates of cure of 16 specimens of sheet, known to have been prepared by coagulation of the latex with alum, varied from one and three-quarters to four and a half hours, which gives a very good idea of the lack of uniformity of such rubber.

COAGULATION WITHOUT CHEMICALS.

In a recent lecture delivered before the Malang Agricultural Society, reported in "De Indische Mercuur," G. J. Zuyderhoff discussed a half dozen principal methods employed for the coagulation of rubber latex, namely: (1) the wild Paré method, its imitation methods by (2) D. MacGillivray, (3) Sanders Birnie, (4) Wickham, (5) Lash van Goengong Toengal, and (6) Clignet's electrical method. The author considers that none of these methods of coagulation are entirely satisfactory and has devised a new method without the use of chemicals. His reasons as stated for undertaking this work were: the high price of acetic acid; the possibility of increasing the intrinsic value of the rubber product, and the preservation of occluded serum in the coagulum and its putrefaction into products of value affecting the rate of cure and physical properties along the line of research developed by Eaton and Grantham.

Zuyderhoff's method as quoted from his lecture is as follows:

The latex is heated in an enameled coagulating basin over a charcoal fire until full evaporation has taken place. The cakes thus produced are put into a long wooden case and air is blown in over them. They are alternately submitted to heat and dry cold and then the mass is tested in the open air.

With a heating appliance placed beneath the wooden case the best results were obtained by (1) heating very moderately underneath and blowing dry air above the cakes, (2) by simply sending heated air over the cakes.

The principal difficulty is to prevent the formation of a film on the upper surface which hinders coagulation of the mass beneath it. This can be done by keeping the upper surface in movement, using the air current to actuate a fan connected to a light wooden rod running the length of the wooden case above the cakes, and having scrapers attached to it that lightly touch the upper surface and keep it in motion. It seems that this evaporation method succeeds very well in a crepe factory and that no complicated installation is necessary.

The making of "slab" rubber is very simple under proper control of the putrefaction. To do this it is desirable to allow the process to take place in a separate building to prevent all kinds of infection. The upper surface of the cakes should be washed with clean water once every 24 hours. The machines which work up the slabs should also be carefully disinfected.

The author states that the color of the crepe produced by his method was at first very irregular, but this difficulty has been since almost overcome. Mr. Zuyderhoff intends to enlist the aid of a government experiment station for aid in further developing his process.

PURITY OF CASTOR OIL.

The following method for determining the purity of castor oil, reported by "Chemical Abstracts," has been worked out by Cherchefskey. It is based on the critical temperature of solution which is defined as the temperature at which a fat in a suitable solvent becomes turbid when this temperature is above the boiling point of the solvent. The method is as follows: A glass tube ten centimeters long and eight millimeters wide is closed at one end, ten drops of castor oil and 40 drops of ethyl alcohol of 0.8481 specific gravity added, and the tube sealed and attached to a thermometer and placed in a glycerol bath. The bath is then gently heated, using the thermometer as agitator. When a turbidity persists the temperature is read. This is constant for every fat. The following table shows results with mixtures of castor oil and other oils. The critical temperature for castor oil is 66 degrees, and as small an amount as two per cent. of foreign oil raises the critical temperature from three to five degrees.

Kind of Oil.	Per cent of foreign oil in castor oil.

SEPARATION OF THE INSOLUBLE MATTER IN CRUDE RUBBER.

For the separation of the insoluble matter in crude rubber Stevens and Clayton Beadle employ phenetol. A gram of rubber in small pieces is placed in a test tube with ten cc. of solvent and heated slowly, so as to reach 100 degrees C. in an hour, and 140 degrees C. in the next half hour. During this heating a peculiar odor is given off, resembling that of toasted (broiled) meat. After cooling, the solution is diluted with 100 cc. of benzene and the insoluble matter allowed to settle. It is washed twice by decantation with benzene, transferred on a tared filter, washed again with benzene, then with alcohol and water, and dried.

CHEMICAL PATENTS. THE UNITED STATES.

TREATMENT OF TIRES.—Tires composed of rubber or rubber-like materials and fiber are placed in open molds in a vulcanizer and entrapped air, gases, and fluids extracted therefrom at an elevated temperature by vacuum, before closing the molds and vulcanizing. (Raymond B. Price, assignor to Rubber Regenerating Co., both of New York City. United States patent No. 1,276,416.)

BRAKE LINING AND PROCESS OF MAKING.—The method consists in impregnating a body of fabric with a solution containing asphalt, an oxide of lead, sulphur, and an oxidation accelerator; and then vulcanizing the impregnated fabric under high heat

and pressure. (William D. Pardoe, assignor to Thermoid Rubber Co., both of Trenton, New Jersey. United States patent No. 1,277,108.)

THE DOMINION OF CANADA.

PIGMENTED RUBBER.—Process and material of coating pigment dust on an uncured rubber surface, and vulcanizing it under a superimposed layer of metal such as aluminum in sheet or powder form. (The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada, assignee of Willis A. Gibbons, Flushing, Long Island, New York. Canadian patent No. 184,218.)

THE UNITED KINGDOM.

WATERPROOFING COMPOSITIONS.—For tarpaulins, etc., gum tragacanth dissolved in water is mixed with lead acetate or aluminum sulphate. These salts may be mixed and the clear solution of aluminum acetate be applied to the fabric, or the fabric may be treated with the solutions separately and lead sulphate precipitated in the fibers. For lighter fabrics, gum tragacanth is mixed with soap dissolved in alcohol and then with aluminum sulphate or lead acetate. (J. D. Williams, 15 Bodford street, Rhyl, Denbighshire. British patent No. 114,494.)

INDIA RUBBER.—Vacuum treatment for removal of fluids from unvulcanized rubber. (W. J. Mellersh-Jackson, 28 Southampton Buildings, London. [General Rubber Co., 1790 Broadway, New York City, U. S. A.] British patent No. 116,322.)

INDIA RUBBER.—Coagulated rubber, gutta, chicle and like latex is treated with a selection of organic compounds in order to form in the coagulum an insoluble layer to prevent the passage through it of colloidal nitrogenous matter. (W. J. Mellersh-Jackson, 28 Southampton Buildings, London. [General Rubber Co., 1790 Broadway, New York City, U. S. A.] British patent No. 116,323.)

LATEX TREATING.—A vacuum process of drying coagulated or uncoagulated latex. (W. J. Mellersh-Jackson, 28 Southampton Buildings, London. [General Rubber Co., 1790 Broadway, New York City, U. S. A.] British patent No. 116,324.)

INDIA RUBBER.—Rubber latex is treated with a member of the benzene series or a derivative thereof, in order to conserve its contained nitrogenous and other constituents and to prevent the formation of slime. For instance, the latex may be treated with 0.2 per cent of beta-naphthol before or after the addition of sulphur, and the product may in addition be given a surface treatment with an alcoholic solution of beta-naphthol. (W. J. Mellersh-Jackson, 28 Southampton Buildings, London. [General Rubber Co., 1790 Broadway, New York City, U. S. A.] British patent No. 116,326.)

AUSTRALIA.

WOOD-PAVING JOINT.—A joint of rubber and cork composition, intended to counteract the expansion and contraction of blocks in wood pavements. (W. Stawell and H. C. Nankwell, attorneys of I. Manchester, Victoria. Australian patent No. 4,879.)

OTHER CHEMICAL PATENTS. THE UNITED STATES.

NO. 1,272,040. Method of vulcanizing molded rubber articles. L. J. D. Healy and A. A. Frank, Milwaukee, assignors to The Federal Rubber Co., Cudahy—both in Wisconsin.
1,274,091. Manufacture of sheet rubber. W. Seward, Toronto, Ont., Canada.
1,273,954. Coating composition. C. P. Townsend, Washington, D. C., assignor to General Bakelite Co., New York City.
1,276,113. Leather substitute and process. R. B. Respass, New York City.
1,276,122. Tire filler. F. A. Hager, Portland, Ore.

THE DOMINION OF CANADA.

183,662. Dental rubber compound. C. J. R. Engstrom, Los Angeles, Cal., assignee of S. C. Supplies, East Orange, N. J.—both in the U. S. A.
184,217. Vacuum treatment to withdraw fluids from unvulcanized rubber, etc. The Canadian Consolidated Rubber Co., Limited, Montreal, Que., Canada, assignee of R. B. Price, New York City, U. S. A.

CEYLON.

1,547. Improvements in adhesive rubber composition. General Rubber Co., New York City, U. S. A.
1,550. Separating rubber from rubber-containing material. General Rubber Co., New York City, U. S. A.

- 1,551. Treating latex, process and product. General Rubber Co., New York City, U. S. A.
 1,557. Treatment of rubber-like and similar materials. General Rubber Co., New York City, U. S. A.

NEW ZEALAND.

- 39,564. Rubber substitute and process. The Western Rubber Co., 1143 Dock street, assignor to M. Gregory—both of Tacoma, Washington U. S. A.

LABORATORY APPARATUS. LABORATORY WATER HEATER.

A CONTINUOUS supply of hot water is very desirable in the laboratory, particularly if it is always obtainable at will. The illustration shows a very neat and dependable apparatus for this purpose. In operation a simple turn of the hand wheel shown at the right turns on both gas and water, the gas being ignited by the small pilot light projecting over the burner. The burner is gauze-covered. The flame passes up the stack and heats the water descending through a spiral pipe. The ordinary size will heat a pint of water a minute, from 50 to 130 degrees F. Other sizes are furnished. All are compact and easily mounted as wall attachments over the laboratory sink or in some other convenient location. (Buffalo Dental Manufacturing Co., Buffalo, New York.)

FOLDING FILTER PAPERS FOR RAPID FILTRATION.

The following practical method of folding and placing quantitative filter papers in funnels has been described by H. A. Noyes in "The Chemist Analyst." The filter paper is folded as shown in I of the cut.

The amount the paper is folded past (a) depends on the funnel used. The corner is torn off so that when placed in the funnel the crease (b) has no chance of drawing in air which lessens the rate of filtration. The paper is shown in II folded in this way and properly placed in a funnel. In this position about 300 cc. of filtrate per minute is possible. The rate of filtration depends on these points: (1) good contact of paper with funnel; (2) the absence of a fold of paper extending to the top, thus preventing suction down the side of the filter; (3) increased filtration pull due to point of the filter being centered over the outlet but not touching the sides of the funnel.

ENGALITH, THE ENGLISH GALALITH.

Galalith, a German composition product of casein, is now being manufactured by three British concerns under the name "Engalith." Large quantities of this substance are being made for war purposes, and for export to America, France, Spain, and Italy as well. It is produced in rods, tubes, and sheets, and in some sixty different colors, and is worked up into a great variety of articles for which hard rubber is commonly used. Being slightly hygroscopic, however, it is not adapted for articles that have to come into frequent contact with water or acid, such as knife handles, bathroom tiles or basins, fountain pens, fishing tackle, storage battery cells, and tooth and nail brushes.

Briefly, the process of making Galalith consists in rendering the casein insoluble by the addition of salts and acids. The product is then dehydrated and dried, when, by the addition of formaldehyde, Galalith is obtained. The process is protected by numerous patents.

REPORT OF THE COMMITTEE ON THE POISONOUS NATURE OF SOME ACCELERATORS, AND PRECAUTIONS REGARDING THEIR USE.¹

By Richard D. Earle, Chairman.

OWING to the increasing use of certain organic compounds as accelerators in the vulcanizing of rubber goods, many of which are marketed under misleading trade names, it is desirable to call the attention of rubber manufacturers to the poisonous properties of some of these products and to the fact that disagreeable factory experiences may result unless due precautions are taken.

The more common accelerators used to-day are aniline, hexamethylene-tetramine, para-phenylenediamine, para-nitroso dimethylaniline and thiocarbamilide.

ANILINE.

SYMPTOMS OF POISONING. In small amounts, pallor, vertigo, and blueness of lips result. In large doses muscular weakness, strangulation and death.

ANTIDOTES. Fresh air, change of clothing, artificial respiration. Use of milk in diet is recommended. Use of alcoholic stimulants predisposes to poisoning and is excessively injurious after poisoning has occurred.

HEXAMETHYLENE TETRAMINE.

SYMPTOMS OF POISONING. Rash and inflammation of skin which has been in repeated contact with stock containing this material. In severe cases blisters filled with watery fluid result.

ANTIDOTE. Cleanliness and care in regard to clothing are the best preventives. Change of occupation will cause the rash to disappear, leaving no permanent effects.

PARA-PHENYLENEDIAMINE.

SYMPTOMS OF POISONING. Inhalation of the dust gives the symptoms of a common cold with sneezing and extreme depression. In larger quantities death with symptoms similar to those of ptomaine poisoning. This is probably the most poisonous of all the accelerators proposed up to date.

All efforts should be made towards prevention of inhalation of dust, by means of suction hoods over the mixing mills.

PARANITROSO DIMETHYLANILINE.

SYMPTOMS OF POISONING. This causes a severe inflammation of the skin, increasing in severity according to the exposure.

ANTIDOTE. Change of occupation.

THIOCARBAMILIDE.

SYMPTOMS OF POISONING. This material decomposes when heated to vulcanizing temperatures with the formation of phenyl mustard oil, the fumes of which cause pallor, blueness of gums and lips. Probably the least poisonous of the common organic accelerators.

ANTIDOTE. Fresh air.

RECOMMENDATIONS.

1.—Cleanliness is essential. The hands should be washed before eating. Before leaving the factory a shower bath should be taken and a complete change of clothing made.

2.—Mixing mills should be provided with adequate suction hoods, in which an efficient draft is maintained.

3.—Ventilation of press rooms, especially if thiocarbamilide is used.

4.—Immediate attention to early symptoms and, if possible, temporary change of occupation in the factory.

5.—Periodical medical examination of employes in mixing and compounding departments, and an educational campaign among employes in regard to non-use of alcohol and chewing tobacco while at work.

6.—In the case of accelerators sold under trade names it is suggested that steps be taken to ascertain the nature of the material.

¹Read at the annual meeting of the Rubber Section of the American Chemical Society held at Cleveland, Ohio, September 11-12, 1918.

The Plantation Rubber Position.

By a Special Correspondent.

WITHOUT question crude rubber prices, supply and demand are the matters of chief present concern, not only to rubber growers and shareholders, but to brokers, merchants and others vitally connected with the plantation industry. The gradual accumulation of large stocks of crude rubber in the East, due to lack of ocean tonnage and the American restriction of imports, together with the consequent continuation of low prices, is causing considerable depression and anxiety. Various circles view the situation in a different light and considerable feeling is developing between the several important producing countries.

Discussion is still rife regarding the restriction of plantation rubber output, but without legislation it would seem to be impossible to enforce it. The 20 per cent reduction agreed upon by members of the Rubber Growers' Association, and to which they have adhered to the extent of 70 per cent of the acreage controlled by members of the association, has not only failed to stabilize the situation, but has opened the way to so-called profiteering on the part of non-members that vitiates the sacrifice to a considerable degree and greatly complicates an already vexed situation. Steps of a much more drastic character appear to be necessary if prices are to be restored to anywhere near their former level, but great difference of opinion exists as to what they should be.

Put briefly, the question for producers is whether to fall in line with the restriction plan of the Rubber Growers' Association, or to endeavor to acquire as much as possible of the trade that is going.

Many small producers, and particularly growers in Ceylon and India, assert that the policy of restriction is designed chiefly in the interests of the big Malayan companies which desire to maintain prices at a high level and let the rubber remain in the trees rather than sell it at 24 or 25 cents per pound, the prices at which the highest grades have been going in Singapore and Colombo. Another group of young producers believe that ocean tonnage is not being allotted fairly and claim that certain large growers and leading merchants have been able to ship considerable consignments when freight space for groups of small growers was either denied or greatly curtailed. They point out that activity in Eastern markets will be seriously reduced if control of the available tonnage by any group of growers is permitted, and state that it will soon be necessary for Eastern governments to intervene, in order that all individual and company planters shall have shipping facilities in proportion to their possessions.

It is common knowledge that the Council of the Rubber Growers' Association has approached the British Government with a view to bringing about compulsory restriction of output accompanied by the fixing of a minimum price in the East. It is claimed that the 20 per cent curtailment covering only part of the acreage in bearing is no longer adequate to meet the situation, but that nearly a 60 per cent reduction is now called for to avert calamity; also that legislation should be resorted to because those who opposed restriction to any extent might now fail to realize the gravity of the present position. While the British Government is giving sympathetic attention to the proposals, it is felt that the negotiations are so protracted as to minimize the relief sought.

Meanwhile many interested parties are engaged in active propaganda and are advocating missions to visit Eastern rubber-producing countries to promote branch organizations of the Rubber Growers' Association, and make the rupee, dollar and guilder companies and private owners realize that membership in a

great international organization consisting exclusively of rubber planters is to their interest, in order that a concerted effort can be made to meet abnormal conditions. They assert that had these companies cooperated with the Rubber Growers' Association and curtailed production 20 per cent, the present demoralized condition of the market would not have occurred, and they paint a very sorry picture of the future of the plantation industry unless a strong organization representing unity of purpose can be effected quickly. Some London interests apparently feel that better support should be accorded by the East and point out that in the absence of a strong organization that can so control production as to guarantee fair prices, the industry cannot be conducted on sound and permanent lines, and that efforts to improve cultivation, tapping and other estate methods through research will prove of secondary importance.

The advocates of restricted production appeared to think that curtailment of American imports on the basis of 100,000 tons per annum would quickly settle the matter as they wished. They pointed out that the world's production in 1918 without restriction was estimated at 300,000 tons, and that if America were going to take only 100,000 tons, and Great Britain only 25,000 tons, the total world's consumption would be only some 160,000 tons, whereas, despite existing restrictions, the rubber output for the current year will not fall far short of 200,000 tons, leaving a surplus of about 40,000 tons. They believed it was clearly the duty of the Straits Settlements and Federated Malay States authorities to prevent the industry which had brought prosperity to Malaya from drifting into financial chaos, and that if the desired results were not forthcoming, the strongest possible pressure should be exerted on the Colonial Office.

As to the advisability of government control, London interests are by no means agreed, however. Prominent bankers and others have openly said they would rather weather any storm than encourage government control because it might be exceedingly difficult to shake off that control after the war. In Ceylon and India, too, most producers take the position that if the future brings better results, all concerned will rejoice in not having resorted to panicky legislation to relieve a temporary chaotic condition, but if it is found that there is no chance of the rubber being shipped, they agree that prompt measures will have to be taken by the planters themselves to restrict production.

Another faction among the large planting interests is openly advocating maximum production and, if necessary, driving small producers into a position little short of ruin. While opponents of this policy admit that rubber growers as a whole will find it exceedingly difficult to meet abnormal market conditions as long as hundreds of small growers are not brought under control, they point out that crushing small and young producers would result merely in a change of ownership, large companies and probably Americans purchasing them and increasing their productive capacity. Complete control of every plantation unit, they claim, is essential to the salvation of the industry.

American restriction of crude rubber imports figures largely in the calculations. All available information points to the probability that the United States Government will only provide rubber for war purposes and essential national needs, and that there is little, if any, likelihood of an early relaxation of the present import restrictions. It is felt that the curtailment of pneumatic tire production to 50 per cent of last year's output in corresponding months may foreshadow similar curtailment in other lines of rubber goods. Furthermore, the ruling of the War Trade Board stipulating that 50 per cent of the imports for August and

September shall come from South and Central America indicates that Eastern plantations will suffer owing to their long distance from the world's greatest manufacturing centers of rubber goods.

Although the maximum prices of first latex crepe and smoked sheet ribbed have been fixed respectively at 63 and 62 cents per pound by the United States Government, these sorts are being sold in the East at 25 and 24 cents, and in many instances at less than the cost of production. It must not be supposed, however, that merchants and brokers are pocketing the difference of 38 cents. New York prices of plantation rubber fluctuate greatly, but are considerably below the maximum prices fixed by the Government, and by purchase in the East, American buyers have been able to obtain their raw material at a lower price than British manufacturers, despite the fact that Great Britain is the largest owner of rubber plantations. This, of course, is largely due to the ocean tonnage which until recently has been available to the United States as against the very restricted amount of British tonnage. And it explains the heavy American stocks in factories, warehouses and in transit, which were announced to be 83,010 tons as of June 30. With London prices ruling about 24 cents higher than those in the East, British manufacturers obliged to purchase their supplies in the London market are placed at a great disadvantage in competition with American firms.

Geographical position and the relative cost of production in various countries are becoming important factors in establishing the average prices realized by growers. For some time past Ceylon appears to have been the favored country, not only because it is probably the cheapest producing country in the world, but very largely on account of more frequent shipping opportunities for consigning rubber to London. On the whole, Colombo and Singapore seem to have enjoyed slightly higher prices than other Eastern markets, Batavia suffering somewhat owing to its position and increasing freight difficulties.

It is natural in the circumstances that opinion in Ceylon should differ somewhat from that of rubber planters elsewhere. Growers there are doubtful that restricted production in Ceylon is necessary, because American buyers, as usual, will naturally buy in the cheapest market. They say that if the present demand for rubber were normal it is doubtful whether the Rubber Growers' Association either could carry out any scheme of restriction, or would consider it wise to attempt to do so. It would probably decide to let the price find its natural level, with the result that many present sources of supply would immediately cease to exist.

Ceylon growers point to the fact that whereas it was widely predicted that a drop in price to about 60 cents per pound would completely eliminate Brazilian rubber, yet although the price has often been lower, this long-threatened industry continues to flourish and supply approximately 40,000 tons annually to various markets. It is believed, however, that if the value were to drop below 48 cents, Brazilian producers would be in a bad way. Were this to happen in normal times it would mean that production had definitely overtaken consumption, which is not the case. Last year the world consumed nearly 240,000 tons of rubber, and if the Central Empires and Russia could obtain all the rubber they want, supplies would be short even on the estimate of possible production. The conclusion is therefore plain that notwithstanding the immense consumption of rubber for war purposes, the war has greatly retarded the industry.

Stocks in Sumatra, Java and Singapore are extremely heavy and there is every indication that more rubber is being produced than can be shipped and consumed under present war conditions. Stocks in London and New York are large considering the restrictions. Unless rubber growers as a whole can get together quickly on a policy of restricted output, or the British Government comes to the rescue with such restriction, price fixing, or both, by legislation, little prospect of prices in the East returning to their normal is to be seen.

Some activity in the forward market for next year and more distant dates has been assumed in certain quarters to indicate that American imports will not be decreased below the 100,000 tons basis. The prices offered for long contracts have been around 30 cents per pound, and although many buyers appear ready to close at that figure, few growers have availed themselves of the opportunity. It is noticeable that many of these would-be buyers desire to arrange for a considerable period of storage, and the suggestion that the names of all such forward buyers be scrutinized with unusual care is a wise one. While many doubtless take only a speculative interest, present market conditions provide an unparalleled opportunity for enemy firms through their agents to purchase rubber at very near cost of production and to carry it as long as necessary with little risk of losing anything thereby.

Viewing the present situation from every angle, and with due regard to the apparent inability of rubber planters as a whole to take concerted action, and the hesitancy of the British Government to intervene, one conclusion stands forth indisputably. It is that the enormous profits of past years in rubber planting are history, and that the time has come when growers must readjust their ideas of rubber values and school themselves to be content with smaller margins of profit such as are customary in the case of most other tropical products. It remains to be seen if the crisis will result in the establishment of factories for the manufacture of rubber goods in Malaya, Ceylon, India or the Dutch East Indies. If such factories supplied only the requirements of the Middle East, an immense saving in ocean tonnage would result.

RUBBER IN UNITED STATES COMMERCE.

NOTEWORTHY changes have been caused by the war in rubber imports and exports for the fiscal year ended June 30, 1918. The year's rubber imports were 389,599,015 pounds, value \$202,800,392; the previous year's imports amounted to 333,373,711 pounds, value \$189,328,674; an increase in weight of 56,225,304 pounds, and in value of \$13,471,718 in favor of 1918.

The majority of the year's imports again came from the Far East (almost entirely plantation rubber), the total weight being 311,909,581 pounds, value \$168,829,521, as compared with 181,431,778 pounds, value \$104,232,552, in the year ended June 30. The great increase in weight and value, 130,477,803 pounds and \$64,596,969, can, to a great extent, be accounted for by the need of avoiding the submarine zone around Great Britain. The imports from London and Liverpool fell to 21,926,945 pounds, value \$12,793,606 from the figures for 1917 (ended June 30 of that year), which were 78,742,217 pounds, value \$51,851,269.

Brazil, largely owing to shipping difficulties, has not done well during the last fiscal year, having sent us only 14,277,914 pounds, value \$14,307,158, as compared with 56,818,966 pounds, value \$25,654,924, the previous year. The figures for the year ended June 30, 1916, were 54,968,227 pounds, value \$25,150,493.

Shipping difficulties also caused imports from Portugal to drop to the very low figures of 538,076 pounds, value \$220,133, from 3,719,703 pounds, value \$1,439,498, for the previous year. Imports of jelutong (Pontianak), duty paid, amounted to 9,994,571 pounds, value \$501,450, from July 1, 1917, to October 31, 1917, while from November 1, 1917, to June 30, 1918, under its classification as duty free we imported 7,481,292 pounds, having a value of \$474,366. Balata imports, which had been much greater in 1917 than in 1916, sank for the year ended June 30, 1918, to figures below those for 1916; for the last fiscal year the figures are 2,449,881 pounds, value \$1,278,610. The improvement in the Mexican situation is one of the chief reasons for the very great increase in the 1918 imports of guayule, 4,307,539 pounds, value \$1,341,095, as compared with the imports for the year ended June 30, 1917, which were only 2,854,372 pounds, value

\$764,484. Shipping difficulties have caused a further remarkable diminution in the imports of the Far Eastern product gutta percha; for the year ended June 30, 1918, they were only 1,151,312 pounds, value \$147,323; the previous fiscal year we had imported 2,021,794 pounds, value \$332,223, and in the twelve-month ended June 30, 1916, 3,188,449 pounds, value \$342,226.

The decrease in scrap rubber imports is striking; for the year ended June 30, 1918, we imported only 13,980,303 pounds, value \$1,019,222; the previous year we imported 20,517,328 pounds, value \$1,569,448; in 1911-1912 rubber scrap imports amounted to 26,293,192 pounds, value \$2,095,065.

The total imports of india rubber, gutta percha and allied gums for the year 1918 were 414,983,610 pounds, value \$206,542,236, against 405,431,069 pounds, value \$194,688,303, for 1917.

Exports of india rubber for the year ended June 30, 1918, amounted to about one-third less than for the previous year, the figures for 1918 were 8,208,280 pounds, value \$4,274,543, while for 1917 they were 12,355,898 pounds, value \$7,304,820. The difference between the imports and exports of india rubber for the year 1918 is 381,390,735 pounds. Allowing for the fact that the stocks in store at the beginning of the year and those carried over at the end of the year are unknown, these figures give some idea of the United States' consumption of rubber.

RUBBER GOODS EXPORTS.

The exports of manufactured rubber goods for the year ended June 30, 1918, amounted to \$33,343,181, against \$31,105,075 for the previous fiscal year, being an increase of \$2,238,106.

The exports of the automobile tires exported during the year was \$13,977,671, as compared with \$12,330,201 for the year ended June 30, 1917. Tire exports to France rose from \$425,132 (1917) to \$661,648 (1918). During the same period exports to Great Britain sank from \$2,636,654 to \$618,071. The value of the tires sent to Argentina was almost as great as that of those that went to Canada. In 1918 Argentina took tires of a value of \$1,650,340 (in 1917, \$1,301,344), and Canada imported \$1,766,518 worth (in 1917, \$1,485,939). Cuban imports were \$1,019,915 in 1917 and rose to \$1,336,233 in 1918. Two notable increases were to New Zealand and British South Africa. New Zealand imported \$946,804 worth in 1918, against \$689,705 in 1917. South African imports amounted to only \$391,211 in 1917; they were \$693,065 in 1918. Exports of belting, hose, and packing again increased considerably in 1918, amounting to \$4,578,396 as compared with \$3,532,384 in 1917. During the year exports of rubber boots increased phenomenally, while exports of rubber shoes decreased by about 25 per cent. In 1918, boot exports came to \$4,861,213; in 1917 they amounted to only \$1,483,379 (1,559,598 pairs in 1918, 600,455 pairs in 1917); in 1918, shoe exports decreased to \$913,128, against \$1,716,225 in 1917 (1,244,170 pairs in 1918, 3,356,484 pairs in 1917). The exports of insulated wires and cables in 1918 were in value \$5,716,275, compared with \$7,192,204 for 1917.

AGATIT.

A new rubber-like material, said to be, in fact, a new regenerated rubber product, has been perfected at the University of Leipzig. It is supplied either in emulsion or colloidal solution, for convenience in many applications, or as a solid. The latter form is said to be much used in packing for condensers and on U-boats. It also serves successfully as a substitute for leather as it can be nailed or sewed. Rubber gloves for medical purposes are made largely of agatit. ("Automotive Industries.")

RUBBER TIRES IN THE FEDERATED MALAY STATES.

Oldfields Dispensaries, Limited, Ipoh, Federated Malay States, are preparing to manufacture rubber tires and other allied products. Activity in rubber manufacture in the Far East is no doubt due at the present time to the prevailing high prices and shipping difficulties, and other rubber factories will probably be established in the same general locality.

THE EXTRACTION OF GUAYULE RUBBER.

THE mechanical extraction of guayule rubber consists, briefly, in reducing the shrub to pulp and separating the rubber by flotation. The product is then desinated, sheeted, and dried, ready for shipment to the rubber manufacturer.

In outline, the method employed consists in submitting wet shrub repeatedly to the action of a special grinding machine, with six corrugated rolls of varying degrees of fineness. By this treatment the shrub is reduced to a suitably comminuted state for the second operation or pulping, which is effected in a pebble mill. This may be described as a metal tumbling barrel, in which a quantity of rounded flint pebbles by their motion triturate the charge to an impalpable fineness. The pebble mills for guayule work operate with about 1,500 pounds of Norway pebbles. The mill is charged about two-thirds full with water and fiber, and is revolved at about 30 turns per minute. After one or two hours the pulping is complete and the rubber thoroughly liberated from the cellular fiber. From the pebble mill the charge is dropped through a grating door into a trough, which leads the rubber and begasse into a central tank; thence it is elevated by conveyor to the skimming tanks, where water is added in

Patel Foundry & Machine Co.

GUAYULE CRUSHER

large volume and the rubber allowed to separate by rising to the surface; then it is floated off and conducted to large settling tanks, in which it is allowed to soak for five or six days. By that time most of the woody fiber entangled with the rubber becomes water-logged and separates by sinking out on the bottom.

The begasse, or ground fiber, and dirt, which settles in the skimming tanks, are washed out through traps and the begasse screened and further dried for use as fuel. The fairly clean rubber from the settling tanks is well washed and sheeted in ordinary rubber washers for removal of adhering fiber or dirt. The final process consists of air-drying the rubber to a definite guaranteed moisture content, 20 per cent for example, or it may be rendered essentially dry by use of vacuum drying apparatus.

MANUFACTURE OF LITHOPONE IN ITALY.

A Milanese company has been formed, says the "Weekly Bulletin of the Canadian Department of Trade and Commerce," for the manufacture of white lithopone in a factory at Brescia (Italy). This product was formerly imported from Germany, but Italy has the raw material necessary for its manufacture. It is expected that a considerable quantity will be available for export. The Italian Government has granted the firm five years' exemption from any income tax.

New Machines and Appliances.

SAND-BLASTING BASES FOR SOLID TIRES.

SAND-BLASTING the steel bases of solid tires is now an accepted practice in the manufacture of tires of the solid type, as a perfectly clean base is essential for satisfactory results. This object is obtained in an efficient manner by the sand-blasting process here described. Moreover, the result is a pitted, roughened surface to which the hard-rubber compound adheres with greater tenacity.

The various sizes of tire bases have necessitated the design of two distinct types of apparatus. For the smaller bases, up to eight inches wide by 24 inches in diameter, a cabinet is used into which the bases are placed by hand, through a front door. The bases, mounted on a spindle, revolve under sand-blast guns at a circumferential speed that insures the surfaces being uniformly and thoroughly cleaned. The various widths are taken care of by the use of four sand-blast guns which can be operated independently. On the outside of the cabinet opposite the door is the driving mechanism for revolving the spindle at the proper speed, consisting of tight-and-loose pulley and the necessary reduction gears. A quick-acting air-valve is within easy reach of the operator for turning the air supply on and off. Individual valves for each sand-blast gun serve the purpose of shutting off those guns which are not required for the narrower bases.

A larger cabinet and different procedure is required for bases up to 14 inches wide by 48 inches in diameter. The bases are mounted on an inclined runway, held in an upright position by guide rails, and delivered to the charging side of the cabinet. They are automatically introduced into the cabinet one at a time, and are revolved by rolls. Seven sand-blast guns are mounted in the top of the cabinet, adjustable to the various diameters and width by hand wheels on the outside of the cabinet. When a base is cleaned the operator trips the mechanism which discharges the cleaned base onto a second inclined runway, and automatically takes on another base to be cleaned. The charging, revolving, and discharging operations are entirely automatic except for the timing of the clean, which necessarily is in proportion to the diameter of the bases, and therefore must be determined by the operator.

The sand-blast guns used on both cabinets are of standard design as used in connection with other types of similar apparatus. They are of the induction type, which means that the sand is elevated from a hopper beneath the cabinet to the gun by syphoning action of the air jet. Each gun consumes approximately 67 cubic feet of free air per minute at a most advantageous pressure of 60 pounds per square inch. The abrasive used for sand-blasting falls into a hopper at the bottom of the cabinet. This hopper has four and seven sand-feeding devices corresponding to the number of guns used on the two cabinets. These sand-feeds supply sand to the guns only when the air is turned on, that is, when the gun is in operation. The connection between the sand-feeds and the guns consists of heavy, wire-inserted rubber hose.

As it is essential that an adequate exhaust and dust-collecting system be used, therefore dust-arresters and exhaust-fans are connected to the sand-blast cabinets by galvanized iron piping of sufficient size, producing the desired results. (The W. W. Sly Manufacturing Co., Cleveland, Ohio.)

SHERARDIZING POLES AND MOLD CAVITIES.

From the beginning the surfaces of steel poles or mandrels used in the manufacture of open heat articles, such as hose and inner tubes, become corroded and pitted, especially at the ends, thereby limiting their usefulness. This corrosion is due to the action of steam and sulphur gases on the exposed surfaces of the mandrels during the process of manufacture. Sherardizing,

however, eliminates this difficulty and consequently has become a standard practice with regard to inner tubes and mandrels. There is no reason why the process of sherardizing should not be applied with success to hose poles in general. This process will also be found advantageous as a permanent lustrous coating for mold cavities in the manufacture of hot-water bottles, bulbs, balls, toys, and similar molded goods.

Sherardizing or dry galvanizing is a process of metallic sublimation applied by first grinding and polishing steel articles which are then packed in a container, with zinc dust, and subjected to heat. As the result, a deposit of zinc is formed that not only coats the steel surfaces but penetrates them and presents a hard, smooth surface of a silvery color that resists rust and will not peel. The deposit does not alter the dimensions of the mold since the coating is only .002 of an inch in thickness.

It is not necessary that all articles should be ground and polished as this process is applied only to mandrels which must

DRUMS CONTAINING TUBE MANDRELS BEING ROLLED INTO A SHERARDIZING FURNACE.

be relieved of all holes to insure a perfectly smooth surface. The standard method as applied to preparing material for nickel plating will usually cover all items.

It is recommended that a standard splicing connection be adopted on hose pole mandrels and all mechanical fittings intended to be sherardized, which would overcome any corrosion in the joints. Furthermore, to extend the life of inner tube mandrels or poles, plugs should be inserted in one end with a hole one inch square for turning in the lathe in order to overcome the ragged edges and the cutting of the mandrel so common when using a grip chuck.

Sherardizing of mandrels is essential at the present time, due to the need for saving steel, as a sherardized mandrel will last almost indefinitely and when worn it can be retreated and restored at a minimum cost. With this fact in view manufacturers have adopted a mandrel of no lighter than No. 13 gage on the very smallest sizes, which will allow regrinding and refinishing several times and still retain enough stock to answer general requirements. (The New Haven Sherardizing Co., New Haven, Connecticut.)

"Rubber Machinery," by Henry C. Pearson, is filled with valuable information for rubber manufacturers. Price, \$6.

THE HIBBS FABRIC-STRIPPING MACHINE.

Herewith is illustrated a machine which provides an expensive method of reclaiming tire fabric. The cost of stripping is low, as one man can strip the fabric from 1,500 to 2,000 pounds of tires per day with this machine, since it removes the fabric without cutting off the beads of the old tire so that only the toe of the bead need be removed. Any number of plies of fabric may be stripped from the tire at one time.

The machine is instantly adjustable from the largest to the smallest tire by turning a

crank. The motor base can be adjusted so that the slack in the driving belt may be taken up without cutting it. The clutch is of extra large single disk type and the driving gears are encased in heavy gear guards. The fabric shaft has a 12-inch forward and backward movement. The machine usually has a one-horse-power, two-phase motor, but can be furnished with a single-phase motor. The shipping weight is about 700 pounds. (The C. D. Hibbs Rubber Co., Fort Worth, Texas.)

A TIRE REBUILDING AND RETREADING MACHINE.

It is a known fact that many carcasses outwear the tread, and if retreaded will continue to be serviceable for many miles.

Moreover, tire users are urged to conserve their tires, and government regulations having eliminated many sizes, therefore the demand for rebuilt tires is increasing.

The machine here pictured is of the enbloc type, having three one-third circle cavities with a cross section of $3\frac{1}{2}$, $4\frac{1}{4}$ and $5\frac{1}{4}$ inches, respectively, and will handle any size of tire, from 28 by 3 to 38 by $5\frac{1}{2}$ inches. The cavities are deep enough to cure the tire over the beads when desired. The ends of the cavities are provided with semi-curing flanges, to guard against any breaks in the cure. The boiler is self-contained, using gas or kerosene as fuel to generate steam.

The raised centers of the side of the cavities are so constructed that with the use of air bags and standard bead molds a section can be cured in the same manner as in regular sectional molds in rib, or with a pad in either plain or non-skid design.

In retreading, the time required for cure in each case is that recommended for the repair material used. The pressure on the tread is secured by pressure against the sand bag placed in the tire.

The machine is adapted to build rib-style, non-skid or plain treads; also tread bands may be cured on and half-soles and double treads applied quickly and efficiently. (Zweibel Brothers Co., Milwaukee, Wisconsin.)

MACHINERY PATENTS.

CALENDER FOR TIRE TREAD STOCK.

THIS machine is a modified four-roll calender designed for the purpose of producing tire tread stock. The calender is provided with pressure rollers that act on the stock before passing between the rolls, and forming a slight bank in front of each roller, thus eliminating air bubbles, equalizing thickness, increasing density and reducing surface imperfections in the calendered rubber strip.

The batch of rubber *A* is fed between rolls *B* and *C* and as the strip of rubber passes under the first banking roller *D*, pressure is exerted on the stock, forming a slight bank on the surface of the strip. After passing between rolls *C* and *E*, the strip is subjected to the action of the second pressure roller *F* that forms a slight bank on the surface of the stock which now passes between rolls *E* and *G* where it receives its final form and finish. (William Kearns, assignor to Morgan & Wright, both of Detroit, Michigan. United States patent No. 1,277,729.)

New Goods and Specialties.

A PATENTED HAIR-CURLER.

A RECENTLY patented hair-curler which is very simple in construction, is shown in the accompanying illustration.

It is formed of a loop of wire, aluminum being used in the one seen, with the ends coming together beneath the band around the smaller end. The wire is flexible enough to permit the

insertion of a rubber ring between the ends, and this ring is positioned within the small loop and held in place by the band. The rubber ring is stretched lengthwise, after the hair is curled around the wire, and is slipped into the inwardly projecting crotch, where it remains securely holding the hair. This device is patented in Canada, although the patentee lives in the States. (M. J. Peppard, Minneapolis, Minnesota.)

THE "ILANASILK" LIFE-SAVING GARMENT.

The great demand of the Government for life-saving garments with which to equip the various units going overseas has stimulated the production of such

suits and various concerns are putting them out. Of course, they are all different, yet alike in that they consist outwardly of a rubber garment of more or less similar character. These rubber outside suits are made by the American Rubber Co., Boston, Massachusetts, and by the Hodgman Rubber Co., Tuckahoe, New York, being supplied by them to the different independent companies holding the patents on the several types.

The "Ilanasilk" suit is composed first of all of an

inner jacket padded with kapok which is sufficiently buoyant to maintain a person in the water without sinking. In order to protect the wearer from exposure and wet, the rubber suit is added. The feet of this are weighted to assist further in holding the person in an upright position, and there is an elastic fabric opening at the neck, through which the head is put. The large opening in the front, by which the suit is put on, is closed by twisting it together and folding it back on itself for insertion in a strap extending from the shoulder. The air is forced out of the suit by pulling it slightly away from the neck and squatting. A hood with goggles is attached to protect against rough water and winds. (The Ilanasilk Lifesaving Garment Co., Inc., 27-35 New Jersey Railroad avenue, Newark, New Jersey.)

A NEW SUPERTIRE.

A new cord supertire is illustrated here, each cord of which is separated from the others and insulated by rubber. It is of multiple-ply construction and has a thick

side-wall above the bead. The tread is jet-black and the side-wall, pearl-gray. The new tire is made in five sizes at the present time. (The Amazon Rubber Co., Akron, Ohio.)

HARD RUBBER CHEMICAL TANK.

A complicated piece of molded hard rubber is shown in the picture below. It is approximately 30 by 10 by 10 inches over all and is used as a chemical tank for an electrolytic process. Earthen-ware boxes were previously used but, while considerably less expensive in initial cost, showed a much greater loss through breakage. Hard rubber was then chosen on account of its ability to withstand the action of acids, its dielectric and mechanical strength, and because hard rubber can be molded more accurately than most other substances. (The B. F. Goodrich Rubber Co., Akron, Ohio.)

THE "STELASTIC" GAS-CONTAINER.

This container for compressed coal-gas used as motor-car fuel is made under the Torkington patents, from hard drawn steel wire with tensile strength of 120 tons per square inch, tinned to prevent rust, in correctly pitched, interlaced spirals. The weaving is as strong laterally as longitudinally, to withstand internal pressures up to 2,000 pounds per square inch. Each end of the fabric is "gathered" together

and over it slipped a forged steel ring electrically welded. Into the gatherings beyond the ring are driven six conical lead wedges, each about three inches long. Inside of the container is a rubber bag made of the best quality of thin rubber. It has a gas pipe at one end and is reinforced with plies of cotton fabric around the pipe seating. The weight of a cylinder four feet long by eight inches internal diameter is 27 pounds complete, and the capacity is 1.39 cubic feet. At 20 atmospheres it contains 27.8 cubic feet of free gas; at 40 atmospheres, 55.6 cubic feet, and at 70 atmospheres (1,000 pounds), 97.3 cubic feet. (Stelastix Times, Limited, 76 York street, Westminster, London, England.)

ANOTHER CUSHION WHEEL.

Various types of wheels are constantly being devised to mitigate the evils of vibration, and one form of these is the resilient wheel. This one has a rubber cushion (see arrow) inserted between the wood felloe and the solid tire, otherwise being of conventional design and construction. The wheel with the rubber cushion applied is pressed into the outer channel band, the transverse bolts screwed up, and the pressed-on tire put into place. All bolts have countersunk heads on the outside of the wheel, insuring smoothness. (Morand Bros. and Martin Cushion Wheel Co., 800-902 South May street, Chicago, Illinois.)

A NIPPLE FOR SPLIT-PALATE NURSING.

The difficulties with which doctors and nurses and parents have to contend in nursing babies who are unfortunate enough to have split palates have been lessened by the invention of a special nipple, shown in the accompanying illustration. This device has as its base a nipple much like the ordinary kind, over which is built a soft-rubber shield, known as a "comparing shield." The whole fits over an ordinary nursing bottle. (F. A. Hardy & Co., 10 Wabash avenue, Chicago, Illinois.)

FIRESTONE "HOLDFAST" PATCH STOCK.

An improvement of the "Holdfast" patch which has been on the market for some time is now being put out. The stock is prepared in sheet form so that it may be cut as small as desired to repair tubes of any size. Previously the patches came already cut in special sizes, which made it necessary for dealers to carry several of these. (Firestone Tire & Rubber Co., Akron, Ohio.)

THE "STADCO SEE-SAFE" WINDSHIELD WIPER.

Anybody who allows his windshield to become misty or clouded with rain and snow must be far from civilization with its multiplicity of windshield cleaners. Every few weeks a new model appears, and practically all of them employ rubber on the squeegee principle for cleaning the glass of the shield. The one pictured here is adapted for attachment on the top edge of the wind-shield, but pivots in such a way as to make it possible to operate it straight across the shield or in a semi-circle. The different parts of this device, on which the trade-mark is copyrighted, and on some features of which a patent has been applied for, are plainly indicated in the drawing. The attachment is not expensive and comes packed by the dozen in a box for counter display. (Stadecker Metal Specialty Co., 358 West Madison street, Chicago, Ill.)

TITAN WORK SHOE.

A new work-shoe, produced at a medium price, while selling for less money than the ordinary leather shoe, has some advantages over the latter which the wage-earner should appreciate. The shoe has an upper of extra heavy duck, reddish-brown in color. The soles and heels are of fiber and rubber of superior wearing quality. The shoe is blucher cut, with one-piece bellows tongue, has a broad high toe with tip, and is an attractive, rugged, easy shoe which should commend itself to wearers. (Apsley Rubber Co., Hudson, Massachusetts.)

RUBBER USED WITH THE "BALKAN" BED.

In THE INDIA RUBBER WORLD for March 1, 1918, was a short account of the work of the Surgical Requisites Association of England in the present war and a letter from Dr. Philip Schidrowitz, the chemist and writer, telling about some of the uses found for rubber in modern surgery and nursing. Some of these

inventions had been made by members of the association, and these included the "double Balkan" hospital bed, of which a sketch has been obtained and is now presented herewith. It is known as the S. R. A. "Williams" double Balkan, and is the invention of two members of the association. A clever arrangement of pulleys and a traveling framework make it possible to raise and lower a patient at will, or his head or feet independently of each other. What is called a girth mattress is used with this bed, made in sections which may be taken apart as required for treatment without moving the patient. Rubber sheeting, tubing for feeding and irrigation, feeding bottles, etc., are used in connection with this bed. (The Surgical Requisites Association, 17 Mulberry Walk, Church St., Chelsea, S. W. 3, London.)

HEAT-TIMING CLOCK FOR MOLD WORK.

The necessity of accurate timing of heats in mold work suggests that the device here illustrated may be of interest. In laboratory work it could be utilized in carrying out chemical tests according to standardized methods.

It closely resembles an alarm-clock in appearance, but in reality it is an interval-timer that can be set for any interval between fifteen seconds and two hours. At the end of the period for which it has been set, the alarm rings and the clock stops. (Victor Electric Corp., 131 East Twenty-third street, New York City.)

RUBBER AND FIBER WELT.

In the making of hand or machine welt shoes, a narrow strip of leather is commonly used for the welt. Some years ago J. N. Moulton invented a welt of rubber, for which he claims that a waterproof seam would result from its use. Recently he has designed a combination welt, which consists of a strip of rubber, skived at one edge, and reinforced for one-half its width with a thickness of heavy duck. This fabric holds the stitches which might tear through a strip not thus reinforced, and the free edge, being elastic, enables the welt to lie flat when stretched around the toe, no matter how small the diameter. (Plymouth Rubber Co., Canton, Massachusetts.)

SPUN GLASS INSTEAD OF RUBBER RINGS.

According to "Die Zeit," a firm in Aussig, Austria, has succeeded in producing a kind of spun glass which answers the same purpose of cork and rubber rings in closing bottles. The invention is said to be very cheap and likely to be of importance.

The Editor's Book Table.

"THE FINANCIER RUBBER SHARE HANDBOOK." FIFTEENTH Edition. June, 1918. The Financier and Ballouist, Limited, London, England. (Cloth, octavo, 880 pages. Price, five shillings net.)

THIS useful annual contains information on stock companies owning rubber plantations no matter where located. It gives their authorized share capital, the amount issued, acreage, etc., together with list of directors. The data are presented in a really serviceable manner. The names, addresses and telephone numbers of the secretaries and agents in London are included.

E. L. Killick, the rubber expert of the "Financier," while admitting in the preface that producers are faced this year with a difficult situation, considers the post-war prospects of the industry excellent owing to the impetus given to motor traction by the war, and still more because enemy and neutral countries have now long been denuded of supplies of crude rubber.

"RUBBER PRODUCING COMPANIES—1918." COMPILED BY THE Mining Lane Tea and Rubber Share Brokers' Association, Limited. "The Financial Times," London, England. (Board covers, octavo, 621 pages. Price, five shillings.)

The sixth edition of this practical handbook has just been issued. It gives the capital authorized and issued, the acreage and tenure, the purchase price, the quantity of rubber tapped, the accounts, etc., of nearly 600 rubber producing stock companies all over the world. It also includes a directory of all the directors, secretaries, and London agents, with the telephone numbers and cable addresses.

In the preface, Mr. Kendall, the editor, urges a great restriction of output but sees a serious obstacle in the fact that such a large number of plantations are native-owned. It is pointed out that one of three different systems could be followed. One might allow only members of the Rubber Growers' Association who restrict their output to export to Great Britain, the European Continent, or the United States of America. A Government order for restriction might be issued, including native-owned estates. The product might be taken over at a price based on the three pre-war years.

"MILITARY AEROPLANES." BY GROVER C. LOENING, B.S.C., A.M., C.E. 1918 Revised Edition published by the author, Long Island City, New York. (Cloth, large octavo, 202 pages, illustrated.)

A valuable book by a recognized authority for the student of aviation or airplane design, and a textbook in extensive use at American, British and Canadian aviation schools. The illustrations and diagrams include details of rubber cord shock absorbers.

"THE MOTOR TRUCK AS AN AID TO BUSINESS PROFITS." 1918. By S. V. Norton, manager truck tire sales department, The B. F. Goodrich Rubber Co., Akron, Ohio. A. W. Shaw Co., Chicago, New York, London. (Cloth, 6 by 9 1/2, 509 pages. Price, \$7.50.)

This volume presents a study in five parts, of the motor truck: (1) fitting the motor truck into your business; (2) making your motor truck do more and better work; (3) maintenance that lowers the cost of upkeep (Under this heading are two chapters on "How Tires Can Raise or Lower the Cost of Upkeep," and "Selecting the Right Tires."); (4) building new business with your motor truck; (5) present tasks and future problems.

Briefly outlining the evolution of trade carriers, the author shows that the horse is being supplanted as a motor because he is only two per cent efficient and his cost in the past ten years has increased 143 per cent. The scope of the book has already been indicated. It merits careful study by both prospective and actual truck users because it discusses in a practical, non-technical way every phase of truck cost, maintenance, operation, etc., and the principles of successful goods transportation by motor. The book contains 329 reproductions of photographs illustrating the motor truck in operation under many conditions, which effectively

add to the arguments in the text. There are also included several charts and forms covering inspection, costs of operation, etc.

"ANNUAL CHEMICAL DIRECTORY OF THE UNITED STATES." Second Edition, 1918. Williams and Wilkins Co., Baltimore, Maryland. (Cloth, 6 by 9, 534 pages. Price \$5 net, postpaid.)

This is an extremely valuable reference work for purchasers of chemicals and supplies for manufacturing and laboratory use. The full range of chemical products is covered, including acids, colors, dyes, explosives, extracts, oils and many other products essential for laboratory, technical and industrial purposes. These are listed alphabetically by products and by manufacturers and dealers. Chemical and chemical engineering apparatus, machinery, etc., are similarly listed in both ways. Analytical and consulting chemists and chemical engineers are cataloged both alphabetically and geographically. Laboratories are listed grouped as industrial, institutional, and Federal, State or municipal.

The lists of societies and associations and technical and scientific journals, United States and foreign, with subscription prices, form a new and valuable feature.

DIRECTORY OF THE SPORTING GOODS TRADE. ELEVENTH Edition. Compiled by J. G. Taylor Spink, Charles C. Spink & Son, St. Louis, Missouri. (Paper covers, 16 mo, 236 pages.)

This convenient book gives in compact form a large amount of information as to first-hand makers or suppliers of practically everything which can be denominated under the head of sporting goods, and naturally includes the names of makers of specialties in rubber coming in that category, from boots to bait, from golf balls to push balls. Undoubtedly the book is one which will be referred to frequently by dealers in sporting goods, and similar lines.

NEW TRADE PUBLICATIONS.

THE YARNALL-WARING CO., PHILADELPHIA, PENNSYLVANIA, has just issued a new binder to hold the various catalog sections it publishes from time to time, the use of which enables its customers to have a complete explanatory catalog of its Yarrow hydraulic valves, meters, automatic boiler skimmers, and other engineering devices for power plants, in which this company specializes.

* * *

THE NEW JERSEY ZINC CO., 55 WALL STREET, NEW YORK CITY, has published for distribution to firms interested in zinc four booklets of its "Handy Reference Library of Zinc Products." The titles are "Pigments," "Metals," "Rolled Zinc," and "Zinc Dust," and each describes briefly certain of the company's compounding ingredients, and contains information of interest to users.

* * *

THE 1918 YEAR-BOOK OF THE MERCHANTS' ASSOCIATION of New York is being distributed among the members of the association. Its 288 pages cover for the year ended May 1, 1918, the many varied and important activities of this organization which has for its object "to foster the trade and welfare of New York." Much of the space is devoted to the cooperation accorded the Federal authorities in helping to solve the many new problems arising from the war. The book contains complete alphabetical and classified lists of members. In the latter, Division XLIII comprises rubber, rubber goods and kindred lines. It includes 28 firms representing most departments of the rubber industry. The textile, chemical, electrical and other allied trades are also well represented.

The Obituary Record.

OWNED A CHAIN OF RUBBER STORES.

ISAAC CROCKER, founder of the Crocker System of rubber stores in New England, died at his summer home, Glendale, New Hampshire, September 28, 1918, aged 61 years. The funeral services were held at his home in Providence, Rhode Island.

Mr. Crocker was born in Biddeford, Maine, and his boyhood days were spent in Albany, Maine, where he attended the public schools, completing his education at the Bethel (Maine) Academy. After his graduation he taught school for a short time; then going to Lowell, Massachusetts, he entered the employ of the Lowell Rubber Co., managed by Granville Hayward, whose brother, J. Francis Hayward, owned several rubber stores. Advancing rapidly from errand boy to salesman, and traveling representative, he was given the management of the Lawrence, Massachusetts, store in 1889, and on the death of Mr. Hayward in 1896 he went to Providence, Rhode Island, to take charge of the Hope Rubber Co. store. In 1903 he purchased the business, which comprised eight rubber stores. Since then he has added to the chain and at his death he owned stores in Brockton, Salem, Haverhill, Worcester, Lowell, Lawrence and Fitchburg, in Massachusetts; Manchester and Nashua, in New Hampshire; Providence and Newport, in Rhode Island.

Mr. Crocker was fond of travel. He was an ardent hunter and fisherman, with a fad for collecting arms and weapons. He greatly enjoyed his summer residence at Glendale, in the lake region of New Hampshire, and was, at his death, one of the largest landed proprietors of that summer colony. He made his home in Providence, Rhode Island, but spent much of his time in visiting his various stores.

Mr. Crocker was a generous employer and on various occasions was wont to bring all his employees to some central city to celebrate anniversaries, or the opening of new stores, thus fostering a spirit of comradeship which prevailed the entire system. He was a member of the Odd Fellows, Knights of Pythias, and Knights of Malta.

He is survived by a widow, and a son and daughter by a former marriage. The son, George I. Crocker, was associated with his father in business.

TWENTY YEARS IN RUBBER SCRAP AND MACHINERY BUSINESS.

Daniel L. Barry, a member of the firm of M. Norton & Co., dealers in rubber scrap and second-hand machinery, Charlestown, Massachusetts, who passed away on October 9, 1918, was born in Boston, Massachusetts, fifty years ago. At the age of thirty he engaged in the scrap rubber and second-hand rubber-mill machinery business with his brother-in-law, under the firm name of M. Norton & Co. The company, under his supervision, dismantled a large number of rubber mills throughout the country.

Mr. Barry was a man of pleasing disposition and upright character, highly respected by his business associates and friends. He is survived by his widow, two daughters, and two sons.

A PROMINENT DEALER IN RUBBER CHEMICALS.

Milton Birch, vice-president and treasurer of the Westmoreland Chemical and Color Co. since December, 1910, died on October 16, after a brief illness. He was born April 25, 1858.

The Westmoreland Chemical and Color Co. succeeded the S. P. Wetherill Company, which concern was the successor of S. P. and G. D. Wetherill, Jr., who started in business in February, 1872. Mr. Birch entered their employ in 1878, and on March

31, 1883, was instrumental in organizing the limited stock company which succeeded the original partnership. Shortly after entering the employ of the old concern, Mr. Birch was one of the young men delegated to start the Lehigh Zinc and Iron Co., afterwards the Lehigh Zinc Co., and now part of the present New Jersey Zinc Co.

Mr. Birch had been a member of the Union League Club of Philadelphia since 1886 and about 20 years ago succeeded to his brother's right in the Loyal Legion. He leaves a widow and two children.

GENERAL SALES MANAGER OF THERMOID RUBBER CO.

Harold F. Blanchard, general sales manager of the Thermoid Rubber Co., and the son of J. F. Blanchard of New York City, died at his home in

Trenton, New Jersey, on October 19, 1918, of pneumonia which developed after an attack of influenza. He was ill but a few days. His widow, who was the daughter of W. J. B. Stokes, president of the Thermoid company, subsequently passed away on October 27. The couple leave two young sons.

Mr. Blanchard was 30 years of age. He was born in Rochester, New York, and was a graduate engineer of Lehigh University. A few years ago he was appointed city manager of the Thermoid Rubber Co. in Philadelphia, Pennsylvania, and about two and a half years ago was made general sales manager of the company in Trenton. The deceased was a member of the Trenton Club and the Trenton Country Club.

HAROLD F. BLANCHARD.

DESIGNER OF MAGNET AND MOTOR-OPERATED BRAKES.

Frank I. Parker, of the Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, died at his home in Milwaukee, October 18, 1918, at the age of 36 years. His death was due to pneumonia contracted after influenza. He was graduated from the University of Wisconsin in June, 1906, and in July became engineer in charge of production in the magnet and clutch department of the Cutler-Hammer company. His early work was with lifting magnets made by this company, he being responsible for many of the exclusive features of these magnets as well as designing several of its magnet and motor-operated brakes. Since 1911 Mr. Parker has had charge of sales service work on clutch department products. He was made an associate member of the American Institute of Electrical Engineers in 1910 and in 1913 became a member. He is survived by his widow and one child.

KNOWN THE COUNTRY OVER.

Benjamin F. Elson, who a few years ago ended a term of 25 years' service with the Boston Belting Co., died at his home in Brookline, Massachusetts, on the nineteenth day of October, 1918, at the age of sixty-one.

He was born in Boston, Massachusetts, the son of Julius and Rosalie Elson, and was educated in the public schools of that city. His first business experience was in the bookkeeping department of a wholesale woolen house, but he entered a similar department of the Boston Belting Co. about 35 years ago, becoming a salesman later. Naturally ambitious, he left the company to form a partnership with Warren Salisbury, of Chicago, to deal in rubber goods in that city. The firm of Salisbury & Elson lasted but a year or two, and Mr. Elson returned to the Boston Belting Co. as its representative in New York City, which position he held until 1906, when he came to the home office to assume the duties of sales manager. On the death of J. B. Forsyth, in 1909, Mr. Elson was appointed assistant general manager, which position he retained until two or three years ago, when a paralytic shock incapacitated him from further active business.

Mr. Elson was well known in the rubber trade throughout the country. He was an able salesman, ambitious and aggressive, and an earnest worker in the interests of the company. He was a member of the Brae-Burn Country Club, the Boston City Club, the Boston Athletic Association, and the New York Republican Club. He is survived by a widow and two brothers.

FORMER DIRECTOR OF HOOD RUBBER CO.

Eugene Jerome Fabens, prominent in banking circles in Boston, and at one time a director of the Hood Rubber Co., Watertown, Massachusetts, died at Salem in that state, on September 26, 1918, from pneumonia. He was born in Salem, September 15, 1883, and early became connected with the banking interests. At the age of 23 he was elected president of the Naumkeag Trust Co., and was the youngest bank president in New England. At the time of his death he was a member of the banking firm of Blake Bros. & Co., devoting a part of each week to managing the New York offices of that concern. He occupied the position of trustee or director in several manufacturing, banking, and insurance companies. He leaves a widow and three children.

SECRETARY OF THE CRESCENT INSULATED WIRE & CABLE CO., INC.

Edgar T. Phillips, secretary of The Crescent Insulated Wire & Cable Co., Inc., Trenton, New Jersey, recently died at his home in the same city.

Mr. Phillips was born near Lambertville, Hunterdon County, New Jersey, on March 30, 1877. He attended the local public schools and also the Lambertville high school, later attending the Stewart Business College of Trenton, completing the commercial course December 20, 1894, and the stenographic course

on June 14, 1895. He shortly afterward accepted his first position with the Crescent company and was elected secretary in 1902, which position he had continued to hold.

SOLD FOOTWEAR IN MAINE.

Charles B. Reynolds, salesman for the Converse Rubber Shoe Co. in Maine, died at Bangor, that state, the middle of October, aged 28 years. He formerly occupied a similar position with the Banigan Rubber Co., of Boston, joining the Converse force when the Banigan company's business and that of other branches were consolidated with the United States Rubber Co. Mr. Reynolds is survived by his widow and infant daughter.

A CAPTAIN OF INDUSTRY.

Charles Gustavus Roebeling died of Bright's disease, at the age of 69, at his home in Trenton, New Jersey, on October 5, 1918.

He was president of John A. Roebeling's Sons Co., of Roebeling and Trenton, New Jersey, and of the New Jersey Wire Cloth Co., Trenton, as well as vice-president of John A. Roebeling's Sons Co., New York City, besides being a director of the Mercer Automobile Co.

He was the third son of the late John A. and Johanna (Herting) Roebeling, and was born in Trenton on December 9, 1849. After graduating from Rensselaer Polytechnic Institute in 1871, he became identified with his father's firm, which was already becoming famous through the construction of the Brooklyn bridge. Charles G. Roebeling was the engineering genius of the Roebeling company, of which his brother Ferdinand W. Roebeling was the fiscal genius. At the death of their father the Roebeling business was worth \$150,000 and gave employment to 150 men, today the book value of the company's property is \$50,000,000, and 8,000 men are employed. It was the genius of Charles G. Roebeling that gave his company its leading position in the world; it was he who designed all the intricate, special and costly machinery needed to pass from one to another of the wonderful developments in the steel and insulated wire business.

Notable monuments to the ability of the deceased are the Oil City suspension bridge at Oil City, Pennsylvania, the cables of the Williamsburg suspension bridge in New York, and the erection of "Cleopatra's Needle" in Central park, New York. One of his greatest accomplishments is the town of Roebeling, New Jersey, his own idea. Up to the present the town has cost \$15,000,000 and the end is not yet.

Charles G. Roebeling was an accomplished pianist and violinist, a great lover of automobiling, of books and of paintings. He was the owner of the greatest private collection of orchids in the world and made an amazing success of hybridizing. His health was much impaired by the loss of his only son in the Titanic disaster, but he was stricken only last August with the disease which carried him off. It was on the 27th of that month that he took to his bed, from which he seldom arose afterward. He was a member of the Iron and Steel Institute of Mining Engineers, the Engineers' Club of New York, and the Lotus Club of Trenton.

He is survived by two brothers, Colonel Washington A. Roebeling, of Trenton, and Edmund Roebeling, of New York, and one sister, Mrs. Josephine Jarvis of New York.

BENJAMIN F. ELSON.

CHARLES G. ROEBELING.

SALES MANAGER IN NEW YORK.

Robert N. Pierson, for eight years a highly valued member of the sales force of the Voorhees Rubber Manufacturing Co., Jersey City, New Jersey, and for the past six years sales manager of their New York City branch, died from pneumonia at his home, 960 East 14th street, Brooklyn, New York, on Sunday, October 20, 1918, at the age of 30.

ROBT. N. PIERSON.

CASHIER OF THE HOOD RUBBER CO.

Arthur Mack, cashier of the Hood Rubber Co., Watertown, Massachusetts, died October 3, 1918, from pneumonia, following an attack of influenza. He entered the employ of the company in July, 1912, as a clerk, and was elected cashier four years later. He is survived by a widow and a three-months-old son.

THE WILL OF FRANK CAZENOVE JONES FILED FOR PROBATE.

The estate of Frank Cazenove Jones is valued at \$20,000 in personal property. Anna M. Jones, the widow, receives \$25,000 from life insurance, besides furniture, bric-à-brac, and household effects. Each of the two daughters receives \$12,500 from life insurance. To the son are left thirty shares of stock in the Okonite Rubber Co. and twenty shares in the Manhattan Rubber Manufacturing Co. The residuary estate is divided among the members of the family.

**INTERESTING LETTERS FROM OUR READERS.
CONGRATULATIONS FROM A RUBBER MANUFACTURER.**

DEAR SIR—Having just carefully read and then re-read your leading editorial in this month's (October) *WORLD* under the title, "American Rubber Trade Attacked," I desire heartily to congratulate you on the same. It is courageous, yet polite and diplomatic. It states the facts. It touches the spot. It places the blame that such a charge should be made on the source from whence it no doubt came. Again congratulations. Sincerely,

JESSE E. LA DOW,

Mansfield, Ohio.

CRUDE RUBBER MAN APPROVES EDITORIAL.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—I have read with much interest your able and truthful contradiction, under the title, "American Rubber Trade Attacked," of the misleading statements contained in some of the recent London publications.

As one who has been intimately associated with the crude rubber business since long before plantation-grown rubber was an established fact, and one who has made a study of planting from a merchant's viewpoint, I wish to congratulate you upon your concise presentation of the *real facts*.

When the British Government was seeking a plan through which it could supply British-controlled rubber to America, and be sure that it did not reach the enemy, one of its own subjects made the suggestion which was finally adopted. He knew the merchants and manufacturers of America and advised that they be put on *honor*.

The plan was put into force and met the hearty cooperation of the whole trade, and it was religiously lived up to by both the merchants and manufacturers, although it entailed large expense and put them to great inconvenience.

Your able reply to the fabrications of London writers who have taken their text from disgruntled speculators, should prove to the Britishers the *true* position of the American rubber merchant and manufacturer.

The future of prices, and the future of the growing industry is in the hands of the owners, a large percentage of whom are Londoners, and America is powerless, but she is willing to help out to the best of her full ability and resources; she does not want to see the growers do an unprofitable business; she recognizes their foresight in the beginning, and their industry in bringing the industry to its present state of perfection; she is willing

and anxious to support it, and casts no covetous eyes towards the profits that are due to the people who make it a success.

Sincerely,

ARTHUR W. STEEDMAN.

New York City.

SIZES OF SOLDIERS' ARTICLES.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—Recently in an interesting article in one of our daily papers, the statement was made that the French cobblers, who had contracted to repair our soldiers' shoes, had refused to keep their agreement. They claimed that the American fighter's foot gear was so much larger than that of the average Frenchman, that it was impossible to do the work at the price which they, in ignorance of that fact, had agreed upon. So they applied for an increase and it was granted.

No one is really proud of large pedal extremities and most of us generally feel the other way about it. But Uncle Sam must admit the fact this time. A trip through a modern rubber shoe factory will convince even the most skeptical; as we see the four-buckle arctic for which Uncle Sam has contracted to keep his boys' feet both warm and dry, we must acknowledge the fact that the larger sizes predominate.

As we follow the shoe from the laster's bench to the final process, let us take a glance at the ticket which gives the schedule of the day's work.

The eights, nines and tens have the lead and are about equal in number. Closely following come the elevens, after which there is a decided drop back to the sevens which lead the twelves by a small margin. Then, strange but true, we find the thirteens, of course in a much smaller proportion, but still numerous enough to outweigh the small-size sixes which make a poor finish upon the ticket. Possibly some fourteens and fifteens are turned out but they are not visible today.

They say that figures do not lie, so even if a man does wear a size larger overshoe than his ordinary shoe, the big sizes are still there.

But we know that the boys over there are our biggest and best, so if they are blessed with good understanding, we have all the more reason to feel proud of them.

Yours truly,

ALBERT W. BARNES.

STATEMENT OF THE INDIA RUBBER WORLD.

Statement of the ownership, management, etc., required by the Act of Congress, of August 24, 1912, of THE INDIA RUBBER WORLD published monthly in New York, N. Y., for October 1, 1918.

COUNTY OF NEW YORK, 1918:

Before me, a notary public in and for the State and county aforesaid, personally appeared E. M. Hoag, who having been duly sworn according to law, deposes and says that she is the business manager of THE INDIA RUBBER WORLD, and that the following is, to the best of her knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, of the Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:
Publisher, The India Rubber Publishing Co., 25 West Forty-fifth street, New York City.
Editor, Henry C. Pearson, 83 Agawam Road, Waban, Massachusetts.
Managing Editor, Henry C. Pearson, 83 Agawam Road, Waban, Massachusetts.

2. That the owners are: E. M. Hoag, 25 West Forty-fifth street, New York City.
2. That the owners are: (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock.)
Henry C. Pearson, 83 Agawam Road, Waban, Massachusetts.

3. That the names and addresses of the stockholders owning or holding 1 per cent or more of the total amount of bonds, mortgages, or other securities are: (If there are none, so state.) None.

4. That the paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in case where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

E. M. HOAG, Business Manager.
Sworn to and subscribed before me this 28th day of September, 1918.

[SEAL]

Notary Public, Westchester County.
Certificate filed in New York County.
Register No. 186, 186-187.
My commission expires March 30, 1920.

NEW INCORPORATIONS.

Acorn Insulated Wire Co., Inc., September 25 (New York), \$300,000. F. Prosser, Bayonne, New Jersey; W. R. Prosser, 250 Lincoln Road, W. George, 102 Dean street—both of Brooklyn, New York. To manufacture insulated wire, etc.

American Rubber Co. of Chicago, October 4 (Delaware), \$1,000,000. F. R. Hansell, Philadelphia, Pennsylvania; J. V. Pimm, S. C. Seymour—both of Camden, New Jersey. Principal office with the Corporation Guarantee & Trust Co., Ford Building, Wilmington, Delaware. To manufacture and deal in rubber and gutta percha, etc.

Audubon Steam Vulcanizing Co., Inc., October 16 (New York), \$1,000. A. Geiger, E. R. Geiger—both of 2600 University avenue, Bronx; M. Brandt, 300 Haven avenue—all of New York City. To repair tires.

Brown Everready Tire Co., Inc., September 24 (Delaware), 3,000 shares capital stock without nominal or par value. N. C. Adossides, C. B. Reid, J. F. Cleveland—all of 42 Broadway, New York City. To manufacture and sell automobile tires.

Burns & Sears Rubber Co., May 15 (Illinois), \$20,000. J. F. Burns, A. R. Sears and R. J. Carnahan. Principal office, Freeport, Illinois. To make, purchase and sell automobile tires and tubes, etc.

Carlisle Sales Co., Inc., September 25 (New York), \$60,000. W. S. Sawyer, 60 Berkeley Place, Brooklyn; A. S. Mortimer, 370 Manhattan avenue, New York City; L. L. Scaserra, 136 Mountview avenue, Staten Island—all in New York. To sell tires.

Chicago Rubber Corp., October 7 (Illinois), \$1,000. M. Reinsberg, C. P. Schwartz and U. S. Schwartz. Principal office, 308 South Michigan avenue, Chicago, Illinois. To manufacture, repair, buy, and sell, at both wholesale and retail, automobile tires, supplies, accessories, etc.

Hudson Tire Co., Inc., October 7 (New York), \$15,000. E. O'Beirne, 2425 8th avenue, M. Bohan, 300 West 130th street, J. O'Connor, 111 West 90th street—all of New York City. Principal office, 144th street and Lenox avenue, New York City. To manufacture tires, etc.

Independent Rubber Works, Inc., September 28 (New York), \$10,000. S. and C. Gordon, both 1021, and H. L. Bishop, 919—all on Bedford avenue, Brooklyn, New York. To do a general auto supply business.

K. & S. Canadian Tire & Rubber Co., Ltd., August 22 (incorporated under the provisions of the "Ontario Companies Act," Canada), \$1,000,000. W. H. Cook, J. D. Murray and G. W. Homme. Principal office, 527 Yonge street, Toronto, Ontario, Canada. To manufacture rubber sundries.

Nu-Life Tire Corp., October 5 (New York), \$1,500. I. Prusack, 1817 Pitkin avenue, G. Portnoy, 535 Stone avenue, L. Orlinger, 1578 Eastern Parkway—all of Brooklyn, New York. To manufacture tires.

Peerless Tire Co., Inc., October 22 (New York), \$1,000. C. and K. Pfleger and M. Guion—all of 1222 avenue C, Brooklyn, New York. To deal in tires, etc.

Sweet & Cottrell, Inc., August 26 (New Jersey), \$50,000. E. F. Sweet, West Grove; R. H. Cottrell, T. C. Cottrell, both of Allenhurst—all in New Jersey. Principal office, 550 Broad street, Newark, New Jersey. F. E. Sweet is agent in charge. To manufacture, buy, sell, import, export, and generally deal in tires for vehicles of all kinds and descriptions.

Tire Brokerage Corp., September 30 (New York), \$1,000. S. A. Paul of 2650, J. L. Diamond and D. D. Deutsch, both of 1789—all on Broadway, New York City. To deal in tires and rubber goods.

Tire Mileage Renewer Corp., October 17 (New York), \$10,000. K. G. Brett, 175 Jay street, Albany, New York; B. B. Glidden, E. H. Glidden, both of Leonia, New Jersey. Principal office, Buffalo, New York. To deal in automobile supplies.

Washington Vulcanizing Co., The, July 30 (Indiana), \$10,000. E. K. and M. B. Sudduth, F. B. Cox, C. C. Martin and C. E. Patton—all of Washington, Indiana. Principal office, Washington, Indiana. To buy and sell motor vehicles, trucks, and trailers.

Yankee Leather Tire Co., September 30 (Delaware), \$95,000. C. L. Rimlinger, M. M. Clancy, F. A. Armstrong—all of Wilmington, Delaware. Principal office is with the Corporation Trust Company of America, Du Pont Building, Wilmington, Delaware. To manufacture and deal in treads for automobile tires, etc.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(665.) A reader asks for the address of the manufacturer of the nipple recommended by Dr. Brophy of Chicago for split-palate nursing.

(666.) A subscriber requests the address of manufacturers of small rubber rings.

(667.) A dealer has inquired for lists of manufacturers of perforated rubber mats and rubber bands.

(668.) A correspondent requests prices for tire rebuilding machinery and appliances.

(669.) A reader wishes the addresses of makers of repair stocks containing reclaimed rubber, properly compounded for use in retreading tires.

(670.) A reader asks for the address of the manufacturer of "Ruberine."

(671.) An inquiry has been received as to where rubber substitute can be purchased.

(672.) Request is made for the address of somebody who can supply wood flour such as used by rubber manufacturers.

(673.) A reader asks where he can obtain latex strainers.

(674.) A manufacturer wishes to obtain metallic hose for covering with rubber and cotton.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce or its district or co-operative offices. Request for each should be on a separate sheet, and state number.

(27,538.) A firm in Italy wishes an agency for waterproof coverings.

(27,562.) A chemical company in England wishes to secure an agency for the sale of carbon black, lithopone, and other chemicals used by the rubber trade.

(27,566.) An agency is desired, on a commission basis, by a man in France for the sale of waterproofed linen, rubber-lined cloth for clothing, and other waterproofed cloth. Correspondence should be in French.

(27,572.) A firm in Spain desires to represent American manufacturers and exporters of automobile accessories. Correspondence should be in Spanish or French.

(27,577.) A business man in Argentina wishes to represent American manufacturers and exporters of tires. Correspondence may be in English.

(27,583.) An agency is desired by a company in Chile for the sale of American automobile accessories. Correspondence may be in English.

(27,592.) A company in Australia desires an agency for rubber goods.

(27,593.) A retail man in France desires an agency for rubber and rubber goods. Correspondence should be in French.

News of the American Rubber Industry.

EMERGENCY HOSPITAL OF THE HODGMAN RUBBER CO.

THE effect of influenza on the rubber mills might have been more serious had not the manufacturers promptly adopted the most efficient methods in combating the disease. Regardless of convenience or expense they have safeguarded the health of their employees and in many instances joined hands with each other in this laudable work.

The value of community of interest was admirably demonstrated last month at Tuckahoe, New York, where the influenza was making considerable inroads among the employees of the Hodgman Rubber Co. Realizing the danger, George B. Hodgman telephoned Frederic C. Hood, whose company at Watertown, Massachusetts, had just experienced a struggle with the disease, asking if doctors and nurses could be secured from that section, as none were available in the vicinity of New York. Prompt and generous was the answer from Mr. Hood who immediately sent to Tuckahoe one of the physicians and two nurses from the Hood Rubber Company's staff, who were later followed by others. Suitable hospital quarters could not be found in town, but fortunately the modern office building of the Hodgman Rub-

HODGMAN OFFICE BUILDING CONTAINING TEMPORARY HOSPITAL.

ber Co. offered ideal accommodations. Forthwith, the second story of the west wing was vacated by the officials of the company and quickly transformed into a modern sanitary hospital. The kitchen and the employees' restaurant in the same building were also placed at the disposal of the hospital staff and the nearby home of F. A. Hodgman was opened for their accommodation. When a sufficient number of beds could not be obtained in New York, an order was sent to Boston and 25 additional cots were promptly delivered by motor truck. Thus Emergency Hospital No. 2, as it is known, was created by the common interest of two well-known rubber companies and the local chapter of the American Red Cross, for the benefit of the mill workers and the citizens of Tuckahoe and nearby villages.

SOCIETY OF CHEMICAL INDUSTRY, NEW YORK SECTION.

The New York Section of the Society of Chemical Industry held a meeting on October 25, at Rumford Hall, 50 East 41st street, New York City. The program consisted of an address by Major H. W. Dudley, British-American Anti Gas Service, entitled, "Gas Warfare Both Offensive and Defensive." The illustrations were official English war pictures. The usual informal dinner was held at the Chemists' Club before the meeting.

SENTENCES IN RAINCOAT FRAUD CASES.

The investigations in the cases of the raincoat makers in New York City charged with various unpatriotic and criminal practices, have resulted to date in the pronouncement of two sentences. Felix Gouled, the army contractor accused of conspiracy with Captain Aubrey W. Vaughan to defraud the Government, was convicted of this charge in the Federal District Court during the week of October 14 and sentenced on October 22 by Judge E. E. Cushman to pay a fine of \$10,000 and serve seven years in the Atlanta penitentiary. His counsel asked that he be released on bail pending an appeal, and this was agreed upon, the amount being fixed at \$25,000, which Gouled furnished. Gouled is facing trial under a further charge of sabotage, and if convicted may be sent to prison for an additional 25 years.

Captain Vaughan was sentenced to two years in prison, upon pleading guilty to a part in the conspiracy. Clemency for him will have to come from the President, the judge stated, as he was sentenced while wearing his full uniform.

The case of the C. Kenyon Co. was also begun on the 22nd of October, in Brooklyn, and nineteen others are to follow.

David L. Podell, the lawyer employed by some of the companies to draw up their agreements, was exonerated from any complicity and received a certificate from the judge and jury to that effect after a six days' trial.

DIVIDENDS.

The B. F. Goodrich Co., Akron, Ohio, has declared its regular quarterly dividends of \$1 a share on common stock, payable February 15, 1919, to stock of record February 5, and of \$1.75 a share on preferred stock, payable January 2, 1919, to stock of record December 20, 1918.

The Hood Rubber Co., Watertown, Massachusetts, has declared its regular quarterly dividend of one and three-quarters per cent on preferred stock, payable November 1 to stock of record October 19, 1918.

The Kelly-Springfield Tire Co., New York City, has declared a quarterly dividend of one dollar (\$1) a share on its common stock, payable November 1 to stock of record October 15, 1918.

The Keystone Tire & Rubber Co., New York City, has received the approval of the Capital Issues Committee of a stock dividend of fifteen per cent, payable December 1 to stock of record November 11, 1918.

The United States Rubber Co., New York City, declared quarterly dividends of two and one and one-half per cent, respectively, on its first and second preferred stock, payable October 31 to stock of record October 15, 1918.

The Westinghouse & Electric Manufacturing Co., East Pittsburgh, Pennsylvania, declared its regular quarterly dividends of one and three-quarters per cent on its common and preferred stock, the former payable October 31 and the latter October 15, to stock of record October 4, 1918.

THE PETLEY RUBBER COMPANY'S FINANCIAL PLAN.

Lynn S. Pease, acting general manager of the Petley Rubber Manufacturing Co., Milwaukee, Wis., reports that a committee consisting of Andrew Bause, chairman, Otto J. Koch, Frank J. Edwards, E. F. Hase and J. J. Hosch, has been formed to work out a plan so that creditors may be paid one hundred cents on the dollar. They claim that the total assets of the company are about equal to the total liabilities, and that the present production is almost entirely for the Government, either directly or indirectly. The company plans to issue notes to its creditors payable in 6, 12, 18 and 24 months, with interest at 6 per cent per annum, accounts of less than \$100 to be paid within 90 days.

GEORGE E. HALL.

AT the annual meeting of the Boston Woven Hose & Rubber Co., held at Cambridge, Massachusetts, October 7, 1918,

George E. Hall, formerly vice-president and general manager of the company, was unanimously elected president and general manager, succeeding Henry B. Sprague, treasurer, who served as president during a portion of the year pending the annual election. Mr. Sprague continues as treasurer and assumes the additional duties of vice-president.

Mr. Hall has been associated with the company eleven years, having previously been identified with the paper manufacturing industry. Coming to the Boston Woven Hose & Rubber Co. in 1907 as general manager, although unacquainted with the rubber industry, he quickly mastered the details and has practically rebuilt the plant, and increased the annual business from \$2,000,000 to \$10,000,000.

Mr. Hall's election to the presidency comes as a fitting tribute to the irrepressible energy and enthusiasm with which he has led his organization in the upbuilding of a business which may easily rank as one of New England's leading industries.

PERSONAL MENTION.

Seneca G. Lewis has been elected vice-president and general manager of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, sharing the office of vice-president with Major C. M. Du Puy, now in France.

H. L. Parmenter has been appointed manager of the Chicago branch of the General Asbestos & Rubber Co., Charleston, South Carolina. He has been in the employ of the company for four years and was previously identified with the manufacturing of packing in the East.

Robert A. Suffern has been appointed manager of the textile department of G. Amsinck & Co., importers of crude rubber and other products, 90 Wall street, New York City. The textile department will handle cotton goods for foreign export.

George H. Carnahan, president of the Intercontinental Rubber Co., New York City, has been appointed vice-president and a director of The Bayer Co., Inc., 117 Hudson street, the same city, by the Alien Property Custodian who now controls the latter organization.

William Pfeiffer, president of the Miller Rubber Co., F. H. Adams, ex-treasurer of The Goodyear Tire & Rubber Co., C. I. Bruner, president of the First-Second National Bank, all of Akron, Ohio, and Captain Ernest E. Buckleton, president of the Northwestern Rubber Co., Litherlands, Liverpool, England, have recently returned from a hunting and fishing trip north of Quebec.

J. H. Fenton, who has some time ago appointed industrial division manager of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, in Los Angeles, California,

GEORGE E. HALL.

is responsible for the activities of the industrial salesmen for the district comprising Southern California, Arizona, New Mexico, and western Texas.

W. H. Hildreth, managing director, Aldens' Successors, Limited, London, England, arrived in New York City last month on a business trip.

A. Powell succeeds H. von Briesen, resigned, as purchasing agent for The Savage Tire Corp., San Diego, California.

J. N. Dine, for five years manager of the Omaha, Nebraska, branch of The Goodyear Tire & Rubber Co., Akron, Ohio, has been promoted to the assistant management of the Chicago branch. He is succeeded in Omaha by C. A. Cramer.

George H. Brush has been elected second vice-president of the Sterling Tire Corp., Rutherford, New Jersey.

Julius Oppenheim is now manager of The Loewenthal Co., rubber scrap dealer, 23 Heyward street, Brooklyn, New York, succeeding Paul H. Loewenthal who has enlisted in the Tank Corps.

J. E. Allen, formerly a salesman for the Braender Rubber & Tire Co., Rutherford, New Jersey, operating out of Chicago, has been made sales manager with headquarters at Rutherford.

George W. Gibbs, formerly advertising manager, is now purchasing agent of the Hodgman Rubber Co. Tuckahoe, New York. F. H. Whitney, who had held this position for fifteen years, has retired to his farm in Florida.

IRVING B. FERGUSON.

IRVING B. FERGUSON, whose name has become familiar to the American rubber industry through his work in connection with the Government's statistical requirements, is a certified public accountant of note.

His name and address will be found on all questionnaires sent out to the rubber trade by the War Trade Board, as the Government's accredited agent in charge of the compilation of these statistics. He has recently received a commission by virtue of which he has taken over some important auditing departments of the War Trade Board.

Mr. Ferguson is a native of New York City and received his early schooling in Paris, Switzerland and Italy. His education, however, was completed in this country, he having graduated from Yale in 1893.

He is a member of the New York Society of Certified Public Accountants and the American Institute of Accountants. His home is in Pelham, Westchester County, New York, and as a member of the Pelham Country Club and the Wykagyl Country Club he enjoys tennis and golf.

IRVING B. FERGUSON.

AMERICAN COTTON FABRIC FOR AIRPLANES.

At the outbreak of the war, linen was considered the only material satisfactory for covering airplane wings, but after the imported stock now on hand is exhausted, only cotton fabric will be used for the purpose on American airplanes. Two fabrics were adopted, the specifications calling for a strength of not less than 80 pounds per inch, in both warp and filling. The first contracts were placed by the Government in September, 1917. In October and November, 1,480,000 yards were ordered. In January, 1918, the production was 173,000 yards. It is now 1,200,000 yards monthly. Contracts have now been let for 11,513,084 yards of fabric, made of long-staple cotton.

TRADE NOTES.

John Royle & Sons, Paterson, New Jersey, have purchased the name, good-will, tools, patterns, etc., of the Clark tubing machine from the estate of Edred W. Clark, Hartford, Connecticut.

The Keystone Tire & Rubber Co., 1877 Broadway, New York City, elected the following directors at the annual meeting of its stockholders: L. Walter Lissberger, Joel Jacobs, Sydney Bernheim, Nathan J. Miller, and Harry H. Jacobson. The capital of the concern has been increased from \$1,500,000 to \$2,000,000.

The Victory Rubber Co., Springfield, Ohio, is completing a two-story factory addition of tile and concrete construction, to be used exclusively for making tires. Modern machinery and equipment are being installed.

G. Amsinck & Co., importers of crude rubber and other products, have removed from 6 Hanover street to 90-96 Wall street, New York City.

The Continental Tire & Rubber Co., 748 St. Charles street, New Orleans, Louisiana, is planning the erection of a factory as soon as permission can be obtained from the Government. It will manufacture Continental tires. George A. Wood is president.

Charles B. Chrystal, importer of minerals, clays, and colors, 11 Cliff street, New York City, has purchased a two-story warehouse at Bishop and Canal streets, Jersey City, New Jersey, to which he will remove as soon as alterations are completed. The new location will give better facilities for handling increasing business.

The Schaefer Rubber Co., 16 East Fourth street, Cincinnati, Ohio, has increased its capital from \$50,000 to \$100,000. The concern maintains a store at 15 East Grand River street, Detroit, also, and the increased capitalization is for the purpose of taking care of its growing trade.

The Sewell Cushion Wheel Co., Detroit, Michigan, has been elected to membership in the Motor and Accessory Manufacturers Association.

The Oriental Rubber and Supply Co., 1166 Bedford avenue, Brooklyn, New York, has increased its capital stock from \$10,000 to \$25,000.

The Federal Rubber Co., Cudahy, Wisconsin, is working on a government gas mask contract on which more than 100 women are employed. In other departments women are being trained to take the places of men wherever possible.

The Parelite Co. has removed from 609 to 416-417 Swetland Building, Cleveland, Ohio.

S. A. E. ADOPTS MOTORCYCLE TIRE SPECIFICATIONS

The Tire and Rim Division of the S.A.E., at the Cleveland meeting, July 12, 1918, adopted the following motorcycle tire capacities and inflation pressures, these now being adopted by the society also:

Tire Size.	Maximum Load. (Pounds per tire.)	Corresponding Inflation Pressure. (Pounds per sq. in.)
2 1/4	175	35
3	325	40
3 1/2	400	45

FORMER BOSTON TIRE MAN RETURNS TO THE HUB.

Thomas R. Burton has been appointed manager of the Boston branch of the United States Tire Co. during the term of the leave of absence granted E. P. Kidder, who is temporarily with the Emergency Fleet Corp. Mr. Burton has been in the tire business since 1900 when he became salesman in Boston for Morgan & Wright. From 1908 until 1911 he was manager of the Boston branch, then branch manager in Pittsburgh, Pennsylvania, and later eastern district manager for the United States Tire Co., which absorbed the Morgan & Wright company. For the last four years he has been located at Atlanta, Georgia, as

branch manager in charge of the business in the South. His return to Boston brings him back among old friends, with whom he is most popular.

CANADIAN NOTES.

THE Dunlop Tire & Rubber Goods Co., Limited, Toronto, Ontario, was one of the prominent exhibitors at the annual Canadian National Exhibition recently held in that city. This concern manufactures tires and inner tubes, rubber heels and soles, mechanical belting and packing, hose, etc. Its various products were extensively displayed in four different booths and attracted merited attention at the exhibition.

Scheuer, Normandin & Co., Montreal, Quebec, are handling in Canada the "Leisure" line of rubber footwear manufactured by the Hood Rubber Co., Watertown, Massachusetts, U. S. A.

The Miner Rubber Co., Limited, Toronto, Ontario, has removed its offices from 146 Wellington street West to 144 Front street West, where it will occupy all of the ground floor, comprising 12,500 square feet of space.

Victor G. van der Linde, until recently development manager of The B. F. Goodrich Co., Akron, Ohio, U. S. A., has resigned in order to take charge of the factory of the van der Linde Rubber Co., Toronto, Ontario. This change has made necessary the further resignation from the vice-chairmanship of the Aircraft Committee of The Rubber Association of America, Inc.

C. H. Cooper, sales manager of the Lynn Rubber Manufacturing Co., Warren, Rhode Island, U. S. A., has been demonstrating the company's foot comfort devices in Toronto recently, at the Robert Simpson Co. store.

Richard Hamer, with the Gutta Percha & Rubber Co., Ltd., Toronto, Canada, holds a research scholarship under the Industrial and Scientific Research Council, appointed by the Canadian Government. The subject of his research was "Aging and Decay of Rubber." The first report has just been completed and deals specifically with "The Direct Examination of Colloidal Rubber Solutions by the Aid of the Ultramicroscope."

Canadian rubber manufacturers held a meeting in October at Toronto, to consider the conservation of rubber by eliminating certain styles of rubber footwear. Canadian manufacturers have for several seasons been doing away with some of their former models, and this and the fact that not as many styles are made in Canada as in the States will lessen numerically the number of styles to be eliminated, as compared with the large number recently listed for elimination in the States. This action is an independent one on the part of the manufacturers, and merits particular commendation for that reason. The changes are to be listed and the final form submitted to the manufacturers first and subsequently to the Canadian War Trade Board for approval.

At a meeting of officials of the Canadian Government on October 22, it was decided to proceed with the plans for raising the Second Victory Loan, the Fifth War Loan, in spite of the prevalence of influenza, it being remarked that the United States had set a splendid example in oversubscribing her Fourth Liberty Loan of \$6,000,000,000 in spite of the great handicap suffered from influenza while the drive was in progress in the States.

The campaign for Canada's Second Victory Loan accordingly began October 28, the amount to be raised having been set at \$500,000,000. Premier Borden bought the first bond but the Duke of Devonshire was the first subscriber by letter.

One of the posters being used shows the heads of the rulers of the four enemy nations above the words: "4 reasons for Buying Victory Bonds." Another reproduces the now famous picture of three French women dragging a plow; above it are the words, "They Serve France." Beneath is the question: "How can I serve Canada?" followed by the convincing answer, "Buy Victory Bonds."

JUDICIAL DECISIONS.

PANTHER RUBBER MANUFACTURING CO., v. I. T. S. CO., Circuit Court of Appeals, Sixth Circuit, March 15, 1918.

The Ferguson patent No. 638,228, for a rubber-heel attachment for boots and shoes, is construed as having a raised marginal portion on the upper side of the tip, leaving a substantial depression in the center. This, it was declared, was not infringed by a heel having shallow scorings or channels in the shape of a shield. (Federal Reporter, Volume 250, page 253.)

FEATHERIDGE RUBBER CO., v. MILLER RUBBER CO., ET AL., District Court, N. D. Ohio, E. D., June 26, 1918.

The Willis & Felix patent No. 1,045,234, for a process for making rubber sponges was held invalid because of the insufficiency of the disclosures to enable one skilled in the art to manufacture sponges with commercial success.

The only step that discloses invention is that of curing under steam pressure in order to preserve intact the walls of the cells formed by the expansion of the blowing material until they can be mechanically ruptured.

A like process was used by the Goodrich people in 1903. They later discontinued the manufacture of the article because of the excessive waste.

Willis & Felix did not disclose a workable compound or blowing and moderating material and with the ordinary compounds the process was not workable. The patent was therefore held invalid. (Federal Reporter, Volume 250, page 255.)

BARRETT ET AL. v. SHEAFFER.—Circuit Court of Appeals, Seventh Circuit, January 2, 1918.

The Sheaffer patent No. 1,118,240, for improvements in attachment for self-filling fountain pens, consisting of a spring arrangement to hold the presser bar firmly, independent of the compressible reservoir in connection with a lever-filling device, held valid and infringed as to claims 1 and 2.

Barrett contracted to make 10,000 holders for the Kraker Pen Co. He delivered some of these, understanding that they would be made into an infringing article. It was therefore found that he was guilty of contributory infringement. Interference proceedings are now pending in the Patent Office. No infringement was found in claims 3, 4, 5, 7, and 11. (Federal Reporter, Volume 251, page 74.)

CUSTOMS APPRAISER'S DECISIONS.

TENNIS BALLS.—The duty on tennis balls, imported by A. L. Tuska Son & Co., of this city, is reduced in a decision rendered by the Board of General Appraisers. When entered here, the customs collector levied duty at the rate of 35 per cent ad valorem, the provision for toys in paragraph 342 of the Tariff Act of 1913. The protestants contended for duty at 30 per cent ad valorem under paragraph 266 as manufactures in chief value of cotton; at 25 per cent ad valorem under paragraph 368 as manufactures of grass, straw or weeds, or at 10 per cent ad valorem under paragraph 368 as manufactures of india rubber or gutta-percha, not specially provided for.

It was shown by the testimony that the merchandise is not a toy and analysis proved that cotton was the component material of chief value therein. Accordingly, it was held dutiable at 30 per cent ad valorem under paragraph 266.

ELASTIC BRAIDS.—The collector's assessment of duty on certain elastic braids is upheld in a decision overruling a protest of Calhoun, Robbins & Co., New York City. The appraiser reported that the goods in question consisted of "elastic braids composed of cotton and india rubber threads and of silk and india rubber threads." Duty was assessed at the rate of 60 per cent ad valorem under paragraph 358 of the Tariff Act of 1913. The importers claimed, that the braids were properly dutiable at the rate of 45 per cent ad valorem under paragraph 316, or at the rate of 25 per cent ad valorem under the provision

in paragraph 262 of said act for "fabrics with fast edges, not exceeding twelve inches in width, all of the foregoing made of cotton or other vegetable fiber, or of which cotton or other vegetable fiber is the component material of chief value, or of cotton or other vegetable fiber and india rubber, and not embroidered by hand or machinery." The protest was overruled in view of the record.

REAPPRAISEMENTS.

Reappraisements of merchandise recently made by the Board of General Appraisers follow:

SIAM.—From the United Malaysian Rubber Co., Singapore, exported May 18, 1917, entered at New York, August 10, 1917, File No. 92220. Entry No. 206163-2. McClelland, G. A.: Siam reboil, entered at \$23; reappraised at \$25.25 per picul. Add packing.

JELUTONG.—From Ned. Ind. Boschproducten Maatschappij, Banjermassin, Borneo, exported Nov. 25, 1917; entered at New York March 3, 1917. File No. 90290. Entry No. 127447-2. McClelland, G. A.: Jelutong (ordinary); invoiced at 8.70 florins per picul. Gutta Hangkang; invoiced at 23 florins per picul. Gutta Katiau; invoiced at 16 florins per picul. Entered at same prices plus buying expenses. Reappraised as entered. Add cases on all.

GUTTA PERCHA, ETC.—From Ned. Ind. Boschproducten Maatschappij, Banjermassin, Borneo, exported June 25, 1917; entered at New York October 9, 1917. File No. 92743. Entry No. 230046-2. McClelland, G. A.: Gutta Dotrian; invoiced at 54 florins per picul. Gutta percha; invoiced at 27 florins per picul. Gutta Katiau, first quality; invoiced at 19.50 florins per picul. Gutta percha; invoiced at 26.50 florins per picul. Entered at same prices plus buying expenses. Reappraised as entered. Add cases on all.

GUTTA PERCHA, ETC.—From Ned. Ind. Boschproducten Maatschappij, Banjermassin, Borneo, exported August 11, 1918, entered at New York January 30, 1918. File No. 94280. Entry No. 8649-1. McClelland, G. A.: Gutta percha; invoiced at 27 florins per picul. Gutta Katiau, 1st qual.; invoiced at 19.50 florins per picul. Entered at same prices plus buying expenses and coolie hire. Add cases. Reappraised as entered.

JELUTONG, ETC.—From Ned. Ind. Boschproducten Maatschappij, Banjermassin, Borneo, exported September 27, 1917; entered at New York January 31, 1918. File No. 94282. Entry No. 9009-1. McClelland, G. A.: Jelutong, ordinary, invoiced at 11.20 florins per picul. Gutta Katiau, first quality, invoiced at 19.60 florins per picul. Gutta percha, invoiced at 28.50 florins per picul. Add cases. Entered at same prices plus coolie hire and buying expenses. Reappraised as entered.

GUTTA KATIAU.—From Ned. Ind. Boschproducten Maatschappij, Banjermassin, Borneo, exported March 15, 1918; entered at New York September 2, 1918. File No. 94294. Entry No. 13607-2. McClelland, G. A.: Gutta Katiau, first quality, invoiced at 19.25 florins per picul. Add cases. Entered at same prices plus buying expenses and coolie hire. Reappraised as entered.

RUBBER SPONGE MANUFACTURE—A CORRECTION.

The following in the September issue of this journal was a bit of carelessness on the part of the Editor and merits correction. The statement was: "The equipment for making bath sponges, for example, is just right for sponge rubber in gas masks."

The thought intended was that the mental equipment, that is the experience, gained in making rubber sponges would be available for the manufacture of sponge rubber for gas masks and for a variety of other war uses. As to the mechanical equipment being the same in the manufacture of rubber sponges and sponge rubber, it is not. The former calls for machinery and devices that cannot be used at all for the latter.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

BOSTON has been hard hit by the epidemic of influenza and its after-course pneumonia, and there were few manufacturing establishments in any line which were not restricted in their working forces on account of the contagion. Happily, the disease is greatly modified in virulence, and business is going along more nearly as it was before the trouble appeared. However, rubber factories are running far from normal, with those having government contracts much busier than the others. The restriction of crude rubber supplies and the curtailment of production are working a hardship on many manufacturers, some of whom cannot fill the orders on their books, and must refuse new business offered them. In spite of this the rubber trade of New England has done its full share in subscribing for the Fourth Liberty Loan Bonds, as it did for the three previous loans.

* * *

The Boston Rubber Shoe Co. has recently opened Aldine House, a delightful home for girls, convenient to its Melrose factory. The house, which is modern in all its equipment, contains 40 well-furnished rooms, giving comfortable home surroundings at low cost to the young women who are fortunate enough to secure these accommodations. Home cooking, with pure milk and vegetables from the company's own farm, are attractive features of the table. The management is in the hands of P. F. and J. T. Bean, who have had years of experience in work of this kind. This is an excellent example of the manner in which rubber manufacturers seek to make their workers comfortable, that their vocations may be attractive.

* * *

Everlastik, Inc., of this city, is doing an immense business in the manufacture of elastic webbing for the production of gas masks for the United States Government. With its present facilities it is turning out each week between 750,000 and 800,000 yards of inch-wide webbing for this special purpose, besides providing other lines of webbing for its regular trade. The corporation has in contemplation the erection of a three-story building in Chelsea, 250 feet long, to accommodate this special work for the Government.

* * *

There was quite a scare at the Melrose factory of the Boston Rubber Shoe Co. one day last month, when several rooms were filled with smoke, and the fire alarm was sounded. No panic ensued, though there was a general rush for exits. Investigation proved that the fire was in the mixing room, which is fireproof. The blaze was extinguished by chemicals, with only a small loss incurred.

* * *

An explosion of gasoline at the plant of the Ryan Ideal Stain and Blacking Co., Lynn, on September 30, completely demolished

the building, causing a loss of about \$20,000 and resulting in the death of the shipper, George Fred Stocker, Jr., the only person in the building at the time, who was buried in the debris when the building collapsed. State Officer Murray who investigated the matter, believes that gasoline which Stocker was using to wash out cement cans, caught fire and caused the explosion.

* * *

J. B. Waddell has been placed in charge of the Boston branch of the Firestone Tire & Rubber Co., Akron, Ohio, succeeding C. C. Goodwyn, resigned.

* * *

The Cambridge Rubber Co has recently completed and is transferring a portion of its machinery to a new brick two-story

building adjacent to its main factory on Main street, Cambridge, and has also purchased a fine four-story brick building immediately in the rear, thus making six substantial buildings at its plant. This concern has shown steady progress since 1914. Though started two years before, it was in that year that Warren MacPherson assumed the presidency of the company. The working force now numbers over 500 persons. George Rockwell, the general manager, has just gone to the Artillery School at Camp Zachary Taylor, and Mr. MacPherson will assume the duties of management during his absence. The company is busy on coated fabrics and slickers for the Government, and is manufacturing a line of heels, soles and other molded goods, under the supervision of Mr. Garber, formerly of the Plymouth Rubber Co., and more recently with the heel and sole department of the Hood Rubber Co.

* * *

The Boston Belting Co. has discontinued its Boston office at 100 Summer street, and located its business office at the factory on Linden Park street, Roxbury, thereby putting the management in closer touch with the work, and in the end it is expected to be of advantage to the customers of the company. W. E. Hardy, who was general sales manager until the acquisition of the majority of the stock some months ago by Willet, Sears & Co., has returned to the concern and has been appointed general manager. Business is being carried on as usual, with a large amount of work on hand, the only drawback being the difficulty in holding a complement of workers owing to the draft and the recent epidemic of influenza.

* * *

The fiscal year just completed in September has been the largest in the history of the Boston Woven Hose and Rubber Co., East Cambridge, the sales totaling well over \$10,000,000 and the plant, now entirely composed of modern reinforced concrete buildings, includes a total of more than 20 acres of floor space. It is recognized as one of the largest and best-equipped plants devoted exclusively to the manufacture of mechanical rubber goods.

ALDINE HOUSE.

THE RUBBER TRADE IN AKRON.

By a Special Correspondent.

THE Government expects to move 40 per cent more freight from the Middle West in 1919 than has been carried during the present year. This means that trucks must assist the railroads as never before, and that the coming year will go down in truck tire history as one of the greatest. Rubber and other Ohio industries are already planning an emergency program for short freight haulage over the highways by motor trucks, employing records, insurance, etc., as in the case of railway freight. The State Highways Transport Committee, appointed by Governor Cox, and of which S. V. Norton, truck tire manager of The B. F. Goodrich Rubber Co., Akron, Ohio, is a member, is now making an analysis of the total tonnage hauled, the routes by which it is or might be carried by motor trucks, and the supply of trucks and drivers. Every state may well have similar information in readiness in case of need.

Six nurses formerly in the hospital department of The B. F. Goodrich Co., Akron, are now in service. Their pictures are shown on this page, as follows: top, left to right—Ella Brown, at a base hospital somewhere in France; Clara Bagent, at base hospital, Camp Sheridan, Alabama; Margaret Trew, in Porto Rico with the American Nursing Corps; below, on ends—Ruth and Mary Sterley, sisters, at Camp Sherman, Ohio; below, center, Mabel Carlson, at Camp Meade, Maryland.

GOODRICH NURSES IN SERVICE.

Employees and officials of The B. F. Goodrich Co. reached their quota of \$2,150,000 towards the Fourth Liberty Loan in less than forty-eight hours. This did not include subscriptions from any of the 125 branches maintained by the company or the \$500,000 purchase by officials of the company in New York.

In response to the call of the Government for material from which to manufacture carbon to put in soldiers' gas masks, The B. F. Goodrich Co. has put Captain L. D. Dana of its Gas Defense Division in charge of making collection throughout Summit County of various kinds of fruit-pits and nut-shells. Government trucks are being used and two tons have been collected already. This material is being dried at Red Cross headquarters in Akron. The public is urged to save and dry all such pits and shells to contribute to the work.

Ralph Moore succeeds A. H. Miner in the legal department of The B. F. Goodrich Co., Akron.

Sixteen employees of the Goodrich company have been retired during the last year under the terms of the company's pension plan. One of these had been with the company 38 years and 11 others, periods varying from 15 to 31 years. Out of the sixteen, four were in the same department and three others in another one.

The Firestone Tire & Rubber Co. has posted a card in each department where all the employees have pledged themselves voluntarily to work full time for the duration of the war. It reads as follows: "The employees in this room 100 per cent vol-

untarily pledged themselves to work full time till our country and its allies win the war." Three thousand employees have already signed this pledge and more are signing daily.

The Firestone Tire & Rubber Co. raised more than its quota of subscriptions to the Fourth Liberty Loan in less than a week. One department averaged \$168 for each employee, raising \$8,000.

Lessons in French were started in October at the Firestone Club for the benefit of girls employed by the Firestone Tire & Rubber Company.

H. G. Kitt succeeds F. M. Morris, enlisted, as factory paymaster at the plant of the Firestone company.

* * *

The Mason Tire & Rubber Co., Kent, has been awarded a contract by the United States Army to manufacture raincoats. Additional space has been leased for the duration of the war and the company expects to be turning out 1,000 coats daily by January 1, 1919.

* * *

The Electric Motor & Repair Co., Akron, maintains a repair department for the purpose of repairing electrical equipment of rubber factories. It also offers the services of its engineering department to its customers.

* * *

Every employe on the payroll of The Marathon Tire &

Rubber Co., Cuyahoga Falls, subscribed to the Fourth Liberty Loan, thus winning the 100 per cent honor flag

* * *

The Western Reserve Rubber Co., Akron, has increased its capital from \$10,000 to \$50,000.

* * *

The Avalon Rubber Manufacturing Co., Akron, has increased its capital stock from \$50,000 to \$200,000.

* * *

Akron factories, as well as the city, will continue on Eastern time until November 28, the Council having passed the necessary resolution to make this effective.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

LABOR shortage as a result of war conditions, coupled with the forced temporary abandonment of work by those suffering from the recent outbreak of influenza, materially curtailed the output of the several plants manufacturing rubber goods in Rhode Island. This was particularly discouraging because of the fact that many of the establishments had fallen far behind their schedules in production and delivery on contracts during the six weeks' strike and shut-down previous to the first of September.

Orders in large volume continue to be received, but the officials find it impossible to keep pace with the increasing demands. For some time a growing number of manufacturers, including rubber concerns, have been taking the attitude, that for at least the period of the war, immigration laws should be less stringent in order that a normal supply of labor for manufacturing purposes may be available. Throughout the state the rubber industry continues to be driven to its utmost, and notwithstanding

the great expansions and improvements which the plants have undergone during the last year, they have been utterly unable to maintain the balance of supply and demand.

* * *

Although the "Fighting Fourth Liberty Loan" in this State was not conducted along industrial lines, as was the case in the three preceding campaigns, still the manufacturers of rubber goods and the allied interests made themselves so prominent that they were fully recognized. Rhode Island had an allotment of \$50,000,000, of which \$30,000,000 was accredited to the city of Providence, which was practically twice the sum called for by the Third Liberty Loan. But notwithstanding this great increase, those in charge went systematically to work and succeeded in securing a total of more than \$61,000,000 in the state and nearly \$35,000,000 in Providence.

On the night preceding the conclusion of the campaign a special gathering was held at the Turk's Head Club at which \$7,458,750 was subscribed, the greater part of which was taken by corporations and individuals that had already subscribed liberally. Only the week before a similar meeting was held at the same place at which \$1,250,000 was subscribed. Colonel Samuel P. Colt, president of the United States Rubber Co., who had otherwise taken a large amount of the bonds, was one of six who subscribed \$100,000 each, at the first meeting. He pledged at the second meeting \$1,000,000 in addition to what he had previously taken and then took \$50,000 each for his two sons in the service—Russell G. and Roswell C. Colt.

It was estimated on the 16th of the month that the employees of the National India Rubber Co. would subscribe fully \$1,000,000 to the loan.

The Woonsocket Rubber Co., Woonsocket, doubled its \$75,000 subscription to the Third Liberty Loan and took \$150,000 of the present issue.

At the National India Rubber Co., Bristol, the overseers, foremen and forewomen held a meeting early in the campaign and formulated a plan whereby a thorough canvass was made of the entire plant. The result was that a substantial subscription of bonds was secured, 2,554 employees taking an aggregate of more than \$200,000.

The Bourn Rubber Co. subscribed \$14,000 for its employees, and the Glendale Elastic Fabric Co. announced its subscription for \$75,000, of which \$15,000 was credited to Providence and \$60,000 to Easthampton, Massachusetts.

* * *

A two-day conference of the superintendents of departments in ten of the manufacturing plants connected with the Footwear Division of the United States Rubber Co. opened at the National India Rubber Co.'s plant, at Bristol, on October 16. The factories represented are located in Cambridge, Millville and Malden, Massachusetts; New Haven, Waterbury and Naugatuck, Connecticut; Newark and New Brunswick, New Jersey, and Woonsocket and Bristol, this state. There were also representatives from the New York office, the party numbering 27 visitors from the eleven cities mentioned, and 20 superintendents of departments in the National India Rubber Co. The visiting representatives inspected the footwear and wire departments and had explained to them the various processes of manufacture. The entertainment provided included luncheon at the National company's plant, music by the orchestra, a Rhode Island clam bake at Colt Farm, and addresses by George Schlosser, the vice-president, M. H. Clark, general footwear factory manager, and others.

* * *

Acting under instructions from George Schlosser, general factory manager, the Woonsocket Rubber Co. in Millville and Woonsocket early last month started upon a plan of giving the operatives in all departments fresh air and rest as means of promoting health during the epidemic of influenza which caused

an unusual amount of sickness and several deaths. At 10 o'clock in the forenoon and again at 3 o'clock in the afternoon employees were allowed to go into the mill yards for fresh air and relaxation. A similar plan was also put into execution at the National plant, Bristol.

* * *

Since its resumption of work following the several weeks of enforced shut-down because of labor controversies, the National India Rubber Co. has been pushing its facilities to the utmost at the Bristol plant to recover lost time. Early in October the announcement was made that the company had received a contract from the United States Government for 300,000 pairs of hospital shoes. This company has installed two new and larger steam boilers, a brick chimney to replace two old brick chimneys, while one iron stack is being erected to serve the whole battery of 15 boilers at the plant. It will be the tallest in town, 175 feet high and will have a flue diameter of eight feet.

* * *

Mrs. John Post Reynolds, who has been in charge of a home for aged women in Fall River, Massachusetts, has been secured as matron of the new day nursery of the National India Rubber Co. soon to be opened, and is to be assisted by skilled nurses. The house purchased for the purpose is at the corner of High and Bourn streets, one block from the plant.

* * *

The Narragansett Electric Lighting Co. is installing at the factory three new transformers of 2,500 kilowatts' capacity, to replace a smaller equipment. These changes are necessitated by the enlargement of the factory and the installing of new machinery.

* * *

The Bourn Rubber Co., continuing its policy of expansion, has recently acquired considerable land with buildings thereon, located on Warren, Harrison and Westfield streets, Providence, adjoining the company's plant. As fast as possible these buildings are to be razed and new buildings of a character suitable to the needs of the company erected in their stead.

* * *

The new restaurant at the Woonsocket plant of the Woonsocket Rubber Co., is now in operation and the one at Millville, Massachusetts, will soon be ready. It is expected that some little time will elapse before the one planned at the Bristol plant will be completed.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

THE Trenton rubber manufacturers responded nobly to the Fourth Liberty Loan appeal, subscribing more than \$500,000. The subscription list was somewhat larger than that made on the three previous loans. The Thermoid Rubber Co. and the Joseph Stokes Rubber Co., controlled by the same directors, headed the list. Both companies contributed \$132,650, and when it was seen that the subscriptions of other manufacturers were increasing, the two concerns announced near the end of the drive that they would buy an additional \$18,000 worth of the bonds. The Ajax Rubber Co. was second with \$81,000, while the United & Globe Rubber Manufacturing Cos. were third with \$77,350. A. M. Sawyer, of the Vulcanized Rubber Co., Morrisville, purchased \$2,000 worth of bonds, and the Trenton Rubber Trade Association subscribed \$1,000.

The list of subscriptions by rubber factories and individuals interested in the trade totaled \$618,250. The list follows:

Thermoid Rubber Co.,	\$150,650
Joseph Stokes Rubber Co.,	81,000
Ajax Rubber Co., Inc.,	77,350
United & Globe Rubber Manufacturing Cos.,	61,000
Empire Rubber & Tire Co.,	55,000
Vulcanized Rubber Co.,	27,000
Home Rubber Co.,	27,000

Hamilton Rubber Manufacturing Co.	25,000
Present Insulated Wire & Cable Co.	25,000
Dillon Tire & Rubber Co.	18,750
Luzerne Rubber Co.	16,500
Whitehead Bros. Rubber Co.	16,100
Trenton scrap rubber dealers	15,000
Sanhican Rubber Co.	5,300
Mercer Rubber Co.	5,000
Wagon Steel Hose & Rubber Co.	5,000
Temple Rubber Co.	3,800
Zee Zee Rubber Co.	3,500
Frank Miller	1,000
Alfred Whitehead, Whitehead Bros.	1,000

Influenza and pneumonia seriously hampered the work in the Trenton rubber industry during the last month and greatly delayed important Government work. In one rubber mill alone nearly one-half the working force was laid up and several of the employees succumbed to the disease. Aside from this the rubber concerns are unable to secure enough help. Nearly all the local rubber concerns are engaged on Government work and therefore their employees will not be placed at other work as will be done in some other manufacturing establishments.

John T. Spicer, a traveling salesman in the employ of the Thermoid Rubber Co., remained off the road for the entire three weeks during the Fourth Liberty Loan drive to assist in the Liberty Loan office in the Commonwealth Building as secretary for William J. P. Stokes, chairman of the last Trenton drive.

The Essex Rubber Co. was the only concern of its kind to occupy a space at the Trenton fair. The company leased a big booth and had young women in charge, attired in bloomers, distributing cards bearing the following: "Men and women who wish to devote their energies toward the production of essentials required for the national welfare and equipment for Pershing's army, address Essex Rubber Co."

The Union Auto Tire Co., Atlantic City, New Jersey, has leased the entire Hardiman Building, 141 North Warren street, for the sale of tires. Several improvements will be made.

William J. B. Stokes, president of the Thermoid Rubber Co., who was chairman of the Fourth Liberty Loan, was so well pleased with the campaign in Trenton that he offered a \$50 bond to the Boy Scout Troop selling the most bonds among boys.

John A. Lambert, treasurer and general manager of the Acme Rubber Manufacturing Co., represents the Trenton rubber industry on the Sub-Regional Committee of the Resource and Conversion Division, War Industries Board. General C. Edward Murray, former treasurer of the Empire Rubber & Tire Co., is chairman of the board.

GENERAL RUBBER CO.'S MATURING DEBENTURES PROVIDED FOR.

In order to provide the funds required to pay off the General Rubber Co.'s five per cent debentures due November 1, 1918, the United States Rubber Co., owner of the General Rubber Co., has sold to Kuhn, Loeb & Co., New York City, \$6,000,000, principal amount, of its five year seven per cent secured gold notes and has agreed to provide the balance of cash required to pay the maturing debentures. The new notes will be secured by deposit with Industrial Trust Co., Providence, Rhode Island, as trustee, of \$9,000,000, principal amount, of United States Rubber Co. first and refunding mortgage five per cent gold bonds, will bear interest from December 1, 1918, and mature December 1, 1923, and be redeemable at the option of the rubber company, as a whole but not in part, on any interest payment date on or after December 1, 1920, at a premium of one per cent for each six months between the redemption date and the date of maturity, together with accrued interest.

ARMY AND NAVY AWARDS.

PANAMA CANAL AWARDS.

THE following awards have been made for furnishing supplies for the Panama Canal:

GASKETS, ASBESTOS.—60, \$47.81, Belmont Packing & Rubber Co., Philadelphia, Pennsylvania.

VALVES.—75, \$60, Empire Rubber & Tire Co., Trenton, New Jersey.

NAVAL SUPPLY AWARDS.

The following awards have been made for furnishing supplies for navy yards:

BALLOONS, RED.—\$28,220.—The Miller Rubber Co., Akron, Ohio.

BUTTONS, HARD RUBBER.—4,750,000 dozen, \$243,200 (part), American Hard Rubber Co., New York City.

COMBS.—\$78,300, American Hard Rubber Co., Trenton, New Jersey.

FERRULES.—\$17.50, Western Rubber Co., Goshen, Indiana.

GROMMETS.—\$55.25, La Favorite Rubber Mfg. Co., Hawthorne, New Jersey.

HOSE, ENGINEER AND WASH DECK.—\$1,560, Boston Belting Co., Boston, Massachusetts.

HOSE, GARDEN.—\$187.50, Acme Rubber Manufacturing Co., Trenton, New Jersey.

HOSE, WATER.—\$165, Manhattan Rubber Mfg. Co., Passaic, New Jersey.

PACKING RINGS.—\$275.04, The B. F. Goodrich Co., Akron, Ohio.

PACKING, SHEET.—\$4,700, Manhattan Rubber Manufacturing Co., Passaic, New Jersey.

TAPE, INSULATING.—\$36,312.50, The Okonite Co., New York City.

TUBING, GUM.—\$147, New Jersey Car Spring & Rubber Co., Inc., Jersey City, New Jersey.

AWARDS FOR QUARTERMASTER'S SUPPLIES.

The following awards have been made by the office of the Quartermaster General:

ARMY NURSE'S RAINCOATS.—\$30,240, United States Rubber Co., Boston, Massachusetts.

RAINCOATS.—\$279,000, United States Rubber Co., Boston, Massachusetts; \$33,480, H. B. Gordon & Co. (Inc.), Boston, Massachusetts; \$55,800 Adolph Deutsch & Co. (Inc.), New York City; \$167,400, C. & E. Raincoat Co., Boston, Massachusetts; \$225,200, Chicago Rubber Clothing Co., Racine, Wisconsin; \$111,600, Apsley Rubber Co., Hudson, Massachusetts; \$200,880, Cambridge Rubber Co., Cambridge, Massachusetts.

ARMY SIGNAL SERVICE AWARDS.

The following award has been made for furnishing supplies for the Army Signal Service:

WIRE, TWISTED, PAIR.—7,500 miles, at \$113.50 per mile. The B. F. Goodrich Co., Akron, Ohio.

GENERAL ENGINEER DEPOT AWARDS

The following awards of rubber goods have been announced at the General Engineer Depot, United States Army:

HOSE, SUCTION, Two-Inch.—40,020 feet, \$5,547.60, Hewitt Rubber Co., Buffalo, New York.

HOSE, SUCTION, WITH FITTINGS.—45,000 feet, \$67,050, The B. F. Goodrich Co., Washington, D. C.; 5,960 feet, \$23,764.44, Boston Woven Hose & Rubber Co., Boston, Massachusetts; 45,000 feet, \$64,350, and 7,500 feet, \$10,725, The Goodyear Tire & Rubber Co., Washington, D. C.

HOSE, WATER, WITH FITTINGS.—46,960 feet, \$68,984, The Republic Rubber Co., Washington, D. C.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

RAW RUBBER.

THOSE firms who are the buyers of Hard and Soft Fine Pará are getting somewhat nervous about their supplies. It is stated that the stock in England is practically nil, and though this is probably an exaggeration, it is certain that the amount on hand is small. Purchases at the present time at the price of 3s. 2d. a pound for Hard Fine are all on the basis of delivery ex first available steamer from Pará. In these days of reduced and to some extent incompetent staffs, mistakes are of more frequent occurrence than was formerly the case and in this connection it would be interesting to hear how many orders were received by the London rubber brokers, whose list quoted Hard Fine Pará at 2s. 3d. when it obviously should have been 3s. 2d. Of late years, owing to rapidity of transport, the washing loss of Fine Pará has shown a rise of two to three per cent, owing to the retention of more moisture, and now that transit has again become slower, buyers are speculating whether they will get back to 15 per cent losses again.

The number of patents recently taken out by the General Rubber Co. of New York in connection with the treatment of raw rubber and latex, and made particularly with the idea of improving the plantation product, show the zeal with which the American rubber chemists are cultivating a new field of research—a field which has hitherto been largely monopolized by the British and Dutch. The subject matter of the patents is too extensive to be profitably referred to in a few lines, and I shall only make the remark that whereas in these patents importance appears to be attached to the retention in the rubber of nitrogenous bodies and carbohydrates, one is always reading in contemporary rubber literature of processes for purifying low-grade rubber by the removal of all bodies which are found in conjunction with the rubber hydrocarbon. If we take it as proved that the small amount of resin in high-class rubber is a good thing and the large amount in low-class rubber a bad thing, it is clear that deresination must not be carried too far. It was probably the overlooking of this point which caused the trouble which manufacturers experienced some years ago when deresinated low-grade rubber was more prominent in the market than is the case to-day.

Probably only very few rubber manufacturers rewash their plantation rubber before use, but I know of some who do this so as to be absolutely certain that no foreign matter enters into their goods. Of course, a quality such as barkly crêpe has to be washed, but I have in my mind firms who religiously rewash first-quality pale-brown crêpe.

PROSPECTIVE COAL SHORTAGE.

The troubles of the trade in the past, prominent among which has been labor, seem likely to be added to by the shortage of coal. At the time of writing, the effect of this shortage has not actually been felt, but the apprehensiveness is such that quotations for price and deliveries of rubber goods are being made with a clause having reference to probable developments which the manufacturers cannot control. With regard to increase in the price of rubber goods, what has recently occurred with balata belting, now double the price of five years ago, this is bound to occur with all goods in which cotton fabric predominates, as the stock of cloth made from cheap cotton gets exhausted.

Meanwhile, despite all attendant worries, the manufacturers generally show satisfactory balance sheets. One of the latest is the Leyland & Birmingham Rubber Co., Limited, which has

a profit of £77,750 (\$376,310), against £63,896 (\$309,256) a year ago. The dividend is 15 per cent for the third year in succession. Moreover, £10,000 (\$48,400) is carried to reserve against nil in the previous year. The issued ordinary share capital of the company is £268,257 (\$1,298,363), while the preferred capital issue is £50,000 (\$242,000).

MANUFACTURE OF RUBBER IN NORWAY.

The paragraph in the July issue of THE INDIA RUBBER WORLD referring to the prospective enlargement of the rubber factory at Mjøndalen reminded me of a tour in Scandinavia in 1905. During my stay in Christiania, on coming from higher latitudes, I took the opportunity of visiting these works. After a journey of about thirty miles in the customary narrow-gauge train drawn by two diminutive but energetic Baldwin locomotives, I arrived at the seaport of Drammen on the Christiania Fjord and managed to find my way to Mjøndalen and its factory. The correct title of the latter is Aktieselskabet den Norske Galøge & Gummivare Fabrik, Mjøndalen-Drammen. The superintendent of the works is or was at that time, G. M. Harrel, who had learned his business in America. The capital of the company was 400,000 kroner (\$108,000). Though some rubber boots were made, the main output was galoshes and soles for tennis shoes. Norway has always obtained much of her rubber footwear from Sweden, where there is a large factory at Helsingborg, and from Germany, though I gather that she is now to satisfy her requirements by the enlargement of the Mjøndalen factory. The Helsingborg works, which must feel the new competition, had a capital of 1,500,000 kroner (\$405,000), employed 600 workpeople and turned out 5,000 pair of galoshes a day. By way of completeness I give the correct title of this works—Helsingborg Gummifabrik Actiebolaget, the last half of this alarming word corresponding to the American "Inc."

SYNTHETIC RUBBER.

It is hardly surprising that what progress has been made with the synthetic rubber problem has to be reported from Germany rather than from other countries in a better position to obtain the natural product. The new factory at Leverkusen is said to be capable of producing 2,000 tons yearly, though as far as I am aware, the cost has not been made public. It is not surprising to hear that the product is more suitable for hard rubber than for soft rubber goods, as the range of materials, by no means all of the rubber class from which satisfactory hard rubber goods can be made, is now quite extensive. No progress in this direction is to be reported from the British company which was floated with a flourish of trumpets in 1912. I might, however, remind those who are apt to be severe on the company, that the Synthetic Products Co., Limited, capital £500,000, (\$2,420,000), was formed, as stated in the prospectus, for manufacturing acetone and fusel oil and for making further experiments in developing synthetic rubber. At present the latter object has been apparently abandoned in favor of the former.

"CRUDE RUBBER AND COMPOUNDING INGREDIENTS."

I see that a new edition of this now well-known work by the Editor of THE INDIA RUBBER WORLD has been issued. Even if in these days when we are exhorted to save our spare cash, there may be some who, already possessing the last edition, do not buy the new one, I feel sure there must be many among the newcomers into the rubber manufacturing field who will send in their orders. That they will obtain up-to-date information, I

feel sure, and no doubt they will also be able to read, as in the earlier edition, of a variety of processes that have been tried but never achieved any useful purpose. In an industry like ours where new ideas are always being put forward, it is decidedly useful to be able to point to the fact that the vaunted novelty of today is identical with a proved failure of the past. The other day I came in contact with a certain chemical used in a more or less recent process in a rubber works and looked into a number of books to find out something about it. Rather to my surprise it was not mentioned. I then thought of the book under notice, and there I found the exact information I wanted. *A fortiori*, those who have no series of chemical works at hand cannot fail to find the book a valuable consultative medium.

RUBBER CARD CLOTH.

Makers report trade as being very good, but that owing to shortage of labor and other current difficulties, it is by no means easy to fill orders promptly. With regard to this business I remember that at the first London rubber exhibition it was stated that the card cloth manufacturers were yielding the point of using plantation rubber, and that it had been tried with success for block rubber. Although unvulcanized rubber-faced cards are expected to last as long as fourteen years, enough time has now elapsed to test the wisdom of the change from Brazilian Soft Fine and it would be interesting to have the results published. This, however, is where difficulties always seem to arise in our trade experiments and I am not hopeful of seeing anything authoritative in print. All I can say myself with certainty on the matter is, that some firms have not yet deviated from their procedure of forty years ago. With regard to the vulcanized rubber cards made by certain firms for use in woolen mills, as these have a much shorter life, I do not see why there need be the same anxiety in making a change. A considerable export trade to all cotton-spinning countries has always been a feature of the English manufacture, but this has been much interfered with by the war, and many orders in hand are remaining unfilled. This is especially the case with Russia, where a branch works was once started by a prominent English company, but was stopped after a few years. In some German works making card cloth, the fabric and steel points were brought from England and made into the completed rubber-faced card in Germany. In the early days of rubber reclaiming, the highest quality which was on the English market was known as Rowley's Amazon rubber, which consisted of the strippings of old unvulcanized card cloths. The name will not be familiar to the younger generation, though no doubt the material comes forward under some other designation.

CONTROL OF SULPHUR.

The article by Campbell Mac Culloch on the sulphur situation in America in the August issue of THE INDIA RUBBER WORLD is of great interest and deals with an important matter in a much fuller way than would be possible in our technical press under existing circumstances. After all, America has been a sulphur producer for only about ten years, and supposing the working of the deep Louisiana deposits by the Frasch process had not come about, she must have been in a very awkward position if she was still dependent upon Sicily for her supplies. It is difficult for some people to believe that a country of the size and presumed general resources of the United States can be short of mineral products, but there are many minerals in which she is greatly deficient. It appears that the pyrites deposits in America have never been worked to any extent and that any new mines cannot be brought into operation quickly enough to be of service to replace the now diminished imports of foreign pyrites. In these circumstances it certainly seems a good move to adopt the thio-gen process of recovering sulphur from waste smelter gases, though the estimated cost of \$10 to \$13 a ton will

probably be exceeded in practice. The smelter fume problem is of much greater importance in America than in any other country, and whether the recovery of the sulphur proves a commercial success or not, it may be made compulsory. In pre-war days the smelter gases were not converted into vitriol because it would have been impossible to market the prospective amount of vitriol. In other countries smelter gases are made to provide the vitriol for the adjacent manufacture of superphosphate. If the proposed government control of sulphur in America works as smoothly as the similar control here, rubber manufacturers will not have much to complain of. With characteristic optimism, our Editor discourses of the possibility of doing without sulphur in the trade, but as the bulk of the urgent work is for government purposes I think we may take it that any government specification will continue to cite sulphur and will not countenance the various alternative methods of producing an apparently vulcanized article. One trembles to think of the new female labor being put on to vulcanize rubber with nitric peroxide or chlorine.

BRITISH SCIENTIFIC PRODUCTS EXHIBITION.

THE recent British Scientific Products Exhibition held in London, says the "India Rubber Journal," had interesting exhibits in connection with aircraft, gas traction and electrical manufactures. A gasoline-resisting rubber hose that does not swell when in contact with gasoline was shown in use as connections between lengths of metallic airplane gasoline tubing. A shock-absorber cord used on the outer carriages of airplanes was also exhibited. The three standard sizes now in use on British machines are as follows:

	(1)	(2)	(3)
Diameter	$\frac{1}{8}$ inch	$\frac{3}{16}$ inch	$\frac{1}{2}$ inch
Load at double extension	226 lbs.	140 lbs.	80 lbs.
Number of double strands	266	172	95

Rubber strands in two distinct coverings of cotton braiding form the cord. Before braiding, the rubber thread can stretch 500 per cent, but to enable it to carry heavy loads it is stretched to two or three times its length and held at that tension by the braiding. The British cord carries a load of 140 pounds at double extension, while the German cord carries 40 pounds.

Balloon fabrics were also shown. The fabric for the outer envelope of British observation balloons has two layers of cotton fabric, folded diagonally in two plies, the outer one dyed green. Between the plies is a layer of rubber, the free surface of the inner ply also being rubber coated. The fabric is of Sea Island or Egyptian cotton, 2.4 ounces per square yard, 118 threads per inch in both warp and weft, and the strength is 54 pounds per square inch. The rubber coating is 3.4 ounces per square yard with a coating equal to .9 of an ounce per square yard on the inside of inner ply. Total weight of the finished fabric is 9 ounces per square yard. Underneath one end of an observation balloon is an open pocket or rudder which is composed of a single-ply fabric of similar weight, strength and color to the one above described, but the inside rubber proofing weighs 1.8 ounces per square yard while the protective coating outside weighs only .6 of an ounce per square yard. The total weight of this finished fabric is 4.8 ounces to the square yard. The material of the balloonnet is like that of the envelope fabric, but lighter. The rubber proofing is the same. Weight of fabric (untreated with rubber) 1.8 ounces per square yard, 108 threads per inch (warp and weft), strength 34 pounds per inch. Total weight of complete fabric 8.1 ounces per square yard. The nurse balloon is of stouter material, having three plies of cotton fabric folded so that the warp and weft threads are parallel, the outer layer of fabric being stouter than the other two and dyed green. There are layers of rubber between the plies and on the outer surface. The total weight of rubber used is 6.6 ounces per square yard, and the complete fabric weighs 16.8 ounces per square yard.

Molded electrical insulation was on exhibit, the Hightensite Co., Limited, of London, displaying Hightensite, which has a dielectric strength withstanding a pressure of more than 20,000 volts per millimeter of thickness, is non-hygroscopic, non-inflammable, and has a wearing surface equal to brass, not carbonizing under sparking.

Another insulation was shown by Messrs. Fleming, Birkby and Goodall, of Liversedge, Yorks. It is heat and acid-proof, not brittle, and has mechanical strength, chemical inertness, and accuracy of molding. Certain grades stand heat up to 2,000 degrees F. The dielectric strength is 550 to 600 volts per millimeter. One grade is similar to amber without being brittle.

The Darnard Lacquer Company, Limited, showed many forms of a material they call Formite, a soluble, fusible, amber-colored resin, soluble in alcohol, ether, acetone, fusel oil, etc., with a melting point of about 150 degrees F., which, when heated to 250 degrees F., changes polymerically into a hard, homogeneous, amber-like product, no longer soluble or fusible at any temperature, with high insulation and good tensile strength. The makers recommend Formite for heat and electrical insulation and also as a substitute for amber and ebony.

The Improved Solidite Co., Limited, of London, displayed Erinoid, a substitute for the German Galalith.

The British Rubber Manufacturers, Limited, Acton, London, displayed their flexible gas container, having on each of its four sides a deep flap, the lower end of which is secured to the tray by an outside fillet. They also showed Egyptian cotton in its raw state, their material treated with five coats of rubber, the finished material with an inner surface of 12 coats of Para rubber, and with the outside separately coated.

MISCELLANEOUS FOREIGN NOTES.

INCREASED PRICES ON SULPHUR IN BRITAIN.

THE British Ministry of Munitions announces the following revised scale of prices:

	Per Ton.
Flowers of sulphur.....	£23 15 0
Roll brimstone.....	22 10 0
Thirds.....	17 15 0

Export is still prohibited. Sulphur will be supplied only in lots of not less than five tons for use in approved trades and industries. A discount of 2½ per cent will be allowed to sulphur merchants and dealers known as such before the war. "Recovered" sulphur can still be procured in the ordinary way from the home producers. All applications to the sulphur committee are to be accompanied by remittance of the price in full.

MECHANICAL RUBBER GOODS FACTORY IN NORWAY.

The Norwegian rubber factory at Mjøndalen, Norway, known as the Aktieselskabet Norske Galog & Gummivarefabrik, it has been ascertained since the publication of the note about this concern in our issue of July 1, 1918, has been forced by war conditions and the scarcity of rubber to limit its production to articles which are absolutely necessary. It is now chiefly interesting itself in experiments with rubber articles of every kind, with a view to taking up the fabrication of mechanical rubber goods as a regular line as soon as suitable materials are available.

PROPOSED CHANGES IN BRITISH PATENT AND TRADE-MARK LEGISLATION.

Practically all of the belligerent countries have taken steps toward mapping out plans and establishing administrative machinery to deal with the economic situation after the war. Great Britain has probably made more progress than any other nation. Among the numerous means being considered to meet altered business conditions, the Board of Trade has introduced two measures providing for far-reaching changes in the trade-mark

and patent legislation, which are intended to eliminate some of the abuses on the part of foreign, particularly German, concerns under the existing law. The changes in the patent law include stricter application of the working clause, greater facilities for licensing, and a revocation of the patent for any abuse of patent rights, such as failure to work the patent, or to grant licenses on reasonable terms, whenever the public interest demands, or unfair conditions imposed on the use or sale of the patented article.

RUBBER IMPORTS IN AUSTRALIA AND NEW ZEALAND.

The increase in rubber goods imported from the United States into Australia from 1913 to 1917 is notable. The figures are furnished by the statistician of the Australian Government, who selects 1913 for the comparison because that year was the last in which returns were reckoned from January through December, the change to the fiscal system having been made in 1914-1915, and because that year can be taken as the latest normal pre-war year. The value of the imports in 1913 was \$623,928, and in 1916-17, \$2,031,822.

The comparison of Victorian imports for the first six months of 1918 and for the corresponding period of 1917 is interesting. For 1918 they were \$1,398,125, and for 1917, \$799,770.

The value of New Zealand's imports of rubber tires for automobiles from the United States rose from \$133,163 in 1914 to \$1,163,726 in 1917.

RUBBER AND RUBBER PRODUCTS FOR DENMARK.

A commercial and shipping agreement, similar to that between the United States and two other Scandinavian nations, has been concluded with Denmark. Foodstuffs, raw materials, manufactured goods and other essential commodities aggregating 352,895 metric tons annually are to be exported. Rubber and rubber products appear in the list as follows: crude rubber, 130 tons; bicycle tires, 100 tons; rubber footwear, 100 tons; machine packing, 100 tons; motor and motorcycle covers and tubes, 250 tons; other rubber manufactures, 100 tons.

SWISS TRADE-MARK OF ORIGIN.

To prepare against attempts made to pass off German goods as of Swiss origin, a national Swiss trade-mark has been instituted and a syndicate for Swiss exportation (Syndicat pour l'Exportation Swiss) has been formed. The syndicate, known as the S. P. E. S., consists of a body of 15 men, and will have its head offices at Geneva. As owner of the mark "S. P. E. S.," indicating Swiss origin, it will give its members the right to use this mark for goods produced on Swiss soil or by Swiss industry, and for goods which have undergone in Switzerland such treatment as to give them a new character. Only native-born Swiss citizens and those who have been naturalized for at least 10 years are eligible for membership.

ARTIFICIAL RUBBER IN GERMANY.

The Dve Factories Company (formerly Friedrich Bayer & Co.), of Leverkusen, is contemplating the building of large extensions in Leverkusen, for which it has already placed the contracts. One of the building contractors has already invited tenders for 30 million bricks. It is reported that artificial rubber and gum will be produced therein. The company is already extensively engaged in the production of these commodities. ("Vossische Zeitung.")

DOMINICAN REPUBLIC RUBBER GOODS IMPORTS.

During 1917 the Dominican Republic imported 84,266 kilos of rubber goods, of which 76,479 kilos came from the United States, 6,949 kilos from Porto Rico, and the rest from Cuba, the United Kingdom, France, Spain, and Japan.

Rubber Planting Notes.

DUTCH EAST INDIAN RUBBER EXPORTS.

A PHENOMENAL increase in the Javanese rubber exports to the United States for 1917 over those for 1916 is reported by United States Consul H. J. Dickinson at Batavia, Java, the reasons being the interruption of steamer service to Europe and the prohibitive freight rates to European markets. The result is that the American importer and the Dutch East Indian exporter have established direct relations of mutual benefit.

Mr. Dickinson thinks it doubtful whether Holland will ever regain the strong position she formerly held as distributor of her colonial produce to American consumers.

From Batavia the rubber exports to the United States were 33,450,281 pounds, value \$18,063,325, for 1916, and they rose to 54,352,904 pounds, value \$30,937,317, for 1917: from the same port jelutong exports rose from 777,148 pounds, value \$29,619, for 1916, to 1,757,651 pounds, value \$151,220, for 1917.

From Soerabaya the rubber exports to the United States were only 7,224,262 pounds, value \$3,886,835, for 1916, and they advanced to 14,001,766 pounds, value \$8,710,336, for 1917; from the same port jelutong exports increased from 2,312,003 pounds, value \$70,757, for 1916, to 6,712,178 pounds, value \$310,665, for 1917. Soerabaya also sent us 574,644 pounds of gutta percha, valued at \$35,158, in 1916, but this port forwarded to us 1,585,614 pounds, value \$112,359, in 1917.

A NEW TAPPING METHOD.

W. van Brakel describes a new method of tapping, successfully employed by him on the Basilam Estate, Bindjei, East Coast of Sumatra. The usual system followed in this district is two cuts over a quarter, from left to right above each other. Mr. van Brakel considered that in this way the flow of latex to the upper cut was somewhat held back by the lower cut, and to prove this, the direction of the cuts was changed. The upper was placed to the left of the lower so that the latex flowed into the cup via the lower cut. Experiments carried out during three and a half months on two plots of 2,700 trees each showed an increased yield of about 12 per cent under the new system, while it was further found that the coolies could tap the same number of trees. In the rainy season, this method causes greater loss of latex, but even so it is said to be more profitable than the old one.

CUBING RUBBER PRIOR TO BALING.

A correspondent suggests in "The Malaysian Tin and Rubber Journal" that rubber planters should make their smoked sheet into five-foot cubes, which would be easy to do when the sheet comes out of the smoking-room, as only few estates would have more than a few to make daily. No ribbing would be required and the name and brand of the estate could be pressed into the cube to a depth of say half an inch. More rubber could be put into a bale this way than when a dealer at a port presses sheets into a baler as he does now. Only the outside of the cube could possibly mold, the mass would be an obstacle to pilfering, and if the outside covering were torn off the "chop" of the estate would still be there.

THE CEYLON RUBBER INDUSTRY.

The Annual Report on the Blue Book for 1917 states that the area under *Hevea* rubber in Ceylon is now about 251,500 acres. Rubber is gradually displacing cinnamon in the western province in the Matara district, large areas formerly under citronella are now being planted with rubber, while in the Kalutara district even rice lands are being converted into rubber estates. The report regrets the diminished production of foodstuffs, says that the rubber is sometimes badly planted, easily becoming diseased,

when it becomes a danger, and states that increased idleness and crime follow the change from rice to rubber growing, as it is far less troublesome to grow rubber than to grow "paddy." Rubber is being interplanted with tea in the low country with a view to replacing tea by rubber.

A notable increase, amounting to 15,910,700 pounds, is reported in the rubber exports of 1917 over 1916. Exports since 1912 have been as follows:

1912pounds	13,256,900	1915pounds	43,574,800
1913pounds	22,649,100	1916pounds	48,669,000
1914pounds	30,672,400	1917pounds	64,579,700

In 1917, the United States were supplied with as much rubber as the United Kingdom. Other countries supplied (in order of importance) were: France, Italy, Russia in Asia, Japan, South America, China. All exports are under license owing to the war.

BALING PLANTATION RUBBER A SUCCESS.

UNDER the stimulation of a request by The Rubber Association of America that rubber prepared in the Far East for shipment to this country be packed in such a manner as to save cargo space to the fullest possible extent, the rubber shippers in that district are rapidly adopting the methods of baling rubber which had their origin in 1915 on the plantations of the United States Rubber Co., in Sumatra. These methods of baling mark the successful conclusion of a long series of experiments to perfect a method of preparing the rubber for transport which would provide a compact, strong package to withstand the long voyage to America, and allow the crude rubber to arrive at its destination in first-class condition, as well as reducing the original cost of the containers to the lowest possible figure.

Previously, plantation rubber was as a rule shipped from the Far East in wooden cases. These were for the most part "momi" cases—wooden boxes of white wood made in Japan for the tea trade—and rough redwood cases. Their use was unsatisfactory because they were frequently broken due to a shrinkage of the wood which was often green lumber, so that dirt and splinters found their way into the rubber. An effort to strengthen the boxes by using wire and iron straps had little effect in preventing breakage during the voyage. Another difficulty connected with the use of the boxes was that it was deemed inadvisable to weigh them to their full capacity because of their lack of strength.

When the late E. H. Pound went to the United States Rubber Co.'s plantations in 1914 as director of the technical department, he took out with him various kinds and sizes of bags, sacks and drills, with which he made an effort to determine the best form of package. Rubber packed in these containers arrived in New York in good condition, showing that it was not necessary to use wood as a covering. Experiments were also made with fiber coverings, but the excessive moisture caused these to deteriorate rapidly, even when well-varnished.

In February, 1915, the company began to ship rubber in gunny sacks lined with cheap cotton cloth procured from India and treated to protect against mold and decay. At this time a number of old tobacco presses found on that part of the plantations formerly used for growing tobacco, were tried out for baling rubber. When pressed, the bales were secured with strap iron which was fastened with an ordinary cotton bale fastener. These presses were of the hand variety but recently power has been applied to the presses, the number of which has been augmented by the latest and most improved type of American presses.

All rubber shipped by the United States Rubber Co. from its plantations since December, 1915, has been forwarded in bales

of this character, and the methods have been used on a large scale at the company's warehouses in Singapore since March of this year. The amount of shipping space saved by the adop-

RUBBER-BALING PRESS AS FORMERLY OPERATED BY HAND.

tion of this method is readily perceived from the statement that a package of five cubic feet now contains 180 pounds of pale crepe as against 120 pounds under the old method, and a package of smoked sheets of similar dimensions contains 230 to 240 pounds as against 180 pounds under the old method of packing.

THE SITUATION IN MALAYA.

By Our Regular Correspondent.

A NEW ROOT DISEASE.

WHAT with import restrictions, scarcity of ship tonnage and a continual battle with tree diseases, the rubber planter in the East is having a thorny time. To add to his troubles, a new root disease has recently been discovered by G. N. Magill, of Changkat Serdang Estate, Taiping. It will be remembered that it was Mr. Magill who also called the attention of rubber planters to the danger of brown bast.

This new disease appears to be the ordinary *Hevea* canker on the roots, which on exposure show wounds where the bark has died away, while the sapwood is discolored. The development of the disease seems to be rapid, but detection in the early stages is practically impossible unless every tree is opened up for inspection and kept so, as the canker is not noticeable until the foliage begins to wither. When the collar and roots are exposed, sores are found.

The crown does not begin to wither until the disease has reached a far-advanced stage, when there appears to be little hope of recovery. Mr. Magill says:

The actual area of the canker wound may not be very large, but bark running out along the laterals and down the tap root becomes dead and, when gently broken, shows plainly minute dried strands of rubber, which resemble that seen in stem canker, though the coloring of the diseased bark is different.

There can be at present only one treatment—excise all diseased tissue and sapwood infected, but in bad cases this almost means depriving the tree of all its support, whilst in cases where the tap root and laterals are infected there is nothing left but to destroy the tree.

Paint exposed wood with solignum and when dry put on a cover of tar; have the area limed and dug over. When a case is finished spray Bordeaux mixture lavishly around and cut a

deep isolation drain around the area with drains from each hole around the root to it. It is early as yet to say whether the treatment will be effective or not.

SCHOOL FOR "TREE-DRESSERS."

Now that diseases are forcing themselves so persistently on the attention of all concerned, the question of a trained understaff, or "tree-dressers" has been revived. "The Malayan Tin and Rubber Journal" suggests that the local government should seek the aid of the Agricultural School of Peradeniya, Ceylon, to undertake a short special course for a selected number of Malayan tree-dressers. A local scheme for a similar institution could then be developed gradually and meanwhile there would be a staff of tree-dressers already at work by the time their number would be reinforced by others trained in Malaya.

A correspondent of the above journal advocates a school for tree-dressers as the best memorial which planters could establish to the memory of Malcolm Cumming, a former chairman of the Malaya Planters' Association.

PLANTERS AND MAN-POWER.

The urgent need of every able-bodied man in Europe led R. C. M. Kindersley to declare at a recent meeting of the Malaya Planters' Association that the time had come when plantations ought to send many more men for military service, even to the detriment of the estates.

So far, Malayan plantations have scarcely been inconvenienced. It happens that at present there is overproduction of rubber, so that restriction of output and consequent decrease of the working force is needed. But even if this were not the case, Mr. Kindersley questions whether there is any justification for holding back Class A men because it is desired to maintain estates at their present high standard. In his opinion, half the planters could leave the country without affecting the production of rubber. He suggests that neighboring estates could arrange for joint management. Furthermore, in view of the fact that conscription will soon be introduced, it seemed to him to be highly desirable that men willing to volunteer should not be held back until they are sent for.

THE PRESENT SITUATION.

The difficult situation in which the rubber industry has been placed by the import regulations of the British and American Government is naturally causing no small amount of concern and discussion. That something must be done and done speedily is felt by every one and certain more or less vague plans have been mentioned. It has been urged that the Government should control rubber as it is controlling Egyptian cotton and Australian wool. While the rubber problem is admitted to be more complex, it is felt that the Government should nevertheless consider the matter seriously and take some kind of immediate action.

Again, it has been proposed that the Malayan Government should appoint a special commission, composed of officials, planters, rubber merchants, and rubber estate accountants, with definite instructions to sit daily until a practicable scheme to meet the present and future needs has been formulated, a scheme that could be accepted without reservation by all the rubber interests in the peninsula.

Others point out that in various countries, allied and enemy, the need for cooperation in different industries has been recognized and that there is a growing tendency toward combination. If a combination of rubber growers were formed, guided by intelligence and foresight, the future of the rubber industry might be more than secured. Meanwhile, however, there is much hazy talk and, as is known, production is increasing and prices are falling.

SOUTH INDIA RUBBER EXPORTS.

Exports of plantation rubber from South India during 1917 were 8,526,748 pounds as compared with 6,009,946 pounds in the preceding year.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED AUGUST 20, 1918.

- N**O. 1,276,120. Airship with gas-bags. J. D. Salts, Bois d'Arc, Mo.
 1,276,148. Cushion tire. J. S. Williams, Riverton, N. J.
 1,276,149. Cushion tire. J. S. Williams, Riverton, N. J.
 1,276,179. Repair strip for tire rim-cuts and blowouts. M. Copps, Reidsville, Ga.
 1,276,184. Treat cups, etc. N. J. Daysh, Poughkeepsie, assignor to De Laval Separator Co., New York City—both in New York.
 1,276,231. Anti-slip device for rubber crutch-tips. T. J. Le Cras, Toronto, Ont., Canada.
 1,276,283. Windshield cleaner. H. D. Thomas, Seattle, Wash.
 1,276,300. Pneumatic vehicle spring. H. P. Arndt, Amston, Conn., assignor of two-thirds to C. M. Ams, New York City. (Original application divided.)
 1,276,325. Valve for pads, etc. R. S. Carling, Los Angeles, Calif.
 1,276,410. Abdominal supporter. D. C. Pratt, Summit, N. J.
 1,276,435. Soft-tire alarm. G. L. Stevens, Long Beach, Calif.
 1,276,485. Demountable rim. W. W. Brown, Burlington, N. C.
 1,276,497. Dirigible balloon. Culver, Sioux City, Ia., assignor of one-half to W. H. Kirchman, Wabon, Neb.
 1,276,511. Eraser guard. L. W. Faber, New York City, assignor to Eberhard Faber Pencil Co., Brooklyn—both in New York.
 1,276,526. Rubbing machine with rubber pads. C. B. Hardy and K. E. Gibson—both in New York City.
 1,276,529. Rubber-settler. J. Horn, Ray, Ariz.
 1,276,533. Tire. S. Hummel, Fort Yates, N. D.
 1,276,597. Tire rim. J. H. Wagenhorst, Akron, O., assignor to The B. F. Goodrich Co., New York City.
 1,276,628. Cushion wheel. A. S. Duffies, Markesan, Wis., and F. Mead, Chicago, Ill.
 1,276,631. Shirt with elastic thigh-bands. R. J. Fields, assignor of one-half to C. C. Fields—both of Baltimore, Md.
 1,276,666. Ladder foot with anti-slipping tread. A. P. Lohmann, Akron, O., assignor to The B. F. Goodrich Co., New York City.

ISSUED AUGUST 27, 1918.

- 1,276,752. Covered hose. H. W. Goodall, Aldan, Pa.
 1,276,875. Pneumatic tire. F. Colby, Tuxedo Park, N. Y.
 1,276,917. Tire rim. E. W. Hofstater, Nyack, N. Y.
 1,276,955. Demountable rim. F. and N. M. Spranger—both of Detroit, Mich.
 1,277,006. Wearing apparel with elastic gathering means. J. P. Weis, assignor to Metropolitan Sewing Machine Corp.—both of Nyack, N. Y. (Original application divided.)
 1,277,007. Wearing apparel with elastic gathering means. J. P. Weis, assignor to Metropolitan Sewing Machine Corp.—both of Nyack, N. Y. (Original application divided.)
 1,277,030. Dental disk and holder. L. A. Young, St. Louis, Mo.
 1,277,031. Overshoe retainer. P. J. Young, Santa Susana, Calif.
 1,277,034. Demountable rim. W. W. Allen, Washington, D. C.
 1,277,037. Dating stamp with rubber cushion. W. F. Bartholomew, Brooklyn, N. Y.
 1,277,064. Fountain pen with several compartments and points for each. L. L. Gugel, Louisville, Ky.
 1,277,090. Collapsible tire-rim. E. C. Ludwick, assignor of one-third each to C. E. Harris and F. A. Wise—all of Basin, Wyo.
 1,277,141. Hairbrush with removable rubber cushion for bristles. W. T. Sherman, Troy, assignor by mesne assignments to H. L. Hughes Co., Inc., New York City—both in New York.
 1,277,142. Hairbrush with removable rubber cushion for bristles. W. T. Sherman, Troy, assignor by mesne assignments to H. L. Hughes Co., Inc., New York City—both in New York.
 1,277,277. Gas-bag for dirigible airplane. J. F. Widen, Merryville, La.
 1,277,330. Resilient wheel. F. J. McNulty, Lowell, Ariz. (Original application divided.)
 1,277,331. Resilient wheel. F. J. McNulty, Lowell, Ariz. (Original application divided.)

ISSUED SEPTEMBER 3, 1918.

- 1,277,396. Cushion tire. J. Dineen, Chicago, Ill.
 1,277,438. Armored rubber tire. H. J. Lomer, Detroit, Mich.
 1,277,516. Tire. C. E. Williams, Akron, O.
 1,277,613. Fountain and stylographic pen. W. Livey, Wallasey, Eng.
 1,277,701. Slush-shot. A. R. De Pass, Columbia, S. C.
 1,277,789. Casing tire. C. L. Van Ness, Akron, O., and F. A. Krusemark, Roanoke, Va., assignors to K. F. C. Tire & Rubber Corp., Roanoke, Va.
 1,277,831. Armored pneumatic tire. W. E. Baumberger, Sacramento, Calif.
 1,277,848. Fountain pen. D. Cameron, Edinburgh, Scotland.
 1,277,871. Repair patch for vehicle curtains, etc. W. C. Craft, St. Paul, Minn.
 1,277,916. V. Gunzberg, assignor to I. B. Kleintert Rubber Co.—both of New York City.
 1,277,953. Cushion tire. F. A. Krusemark, I. G. Funkhouser, and H. G. Carpenter, assignors to K. F. C. Tire & Rubber Corp.—all of Roanoke, Va.

- 1,277,984. Resilient wheel. A. Mcletti, Beverly, assignor of one-fourth to H. Walter and one-fourth to A. L. Fancoast, both of Riverside—all in New Jersey.
 1,277,995. Rubber-covered roller. J. Musket, assignor to F. Reddaway & Co., Limited—both of Pendleton, Manchester, Eng.
 1,278,036. Window cleaner. F. J. Shanley, Jr., assignor of one-third to J. Miller and one-third to J. D. Sullivan—all of Chicago, Ill.
 1,278,078. Tire. B. Harris, East Akron, O.

ISSUED SEPTEMBER 10, 1918.

- 1,278,090. Submersible boat for an individual, with rubber leg portions, etc. W. R. Barringer, Denver, Colo., assignor to The Submersible Boat Co., a Colorado corporation.
 1,278,139. Fabric shield for air-tubes of pneumatic tires. S. G. Gillespie, Charleston, W. Va.
 1,278,144. Inflatable life-preserver. W. W. Haupt, assignor to C. Krutcoff—both of Chicago, Ill.
 1,278,224. Split inflatable tire. F. G. Saylor, Quincy, assignor of one-fourth to G. A. Lufkin, Revere—both in Massachusetts.
 1,278,249. Union garment, with elastic band. W. B. Straub, Pottsville, assignor of one-half to F. C. Yingst, Port Carbon—both in Pennsylvania.
 1,278,320. Shoe tread with resilient plug. G. S. Ellithorpe, Rogers Park, Ill.
 1,278,335. Girdle. E. Guggenheim, assignor to Treo Co., Inc.—both of New York City.
 1,278,375. Fiber and rubber composition half-sole for boots and shoes. J. McI. Ogilvie, Toronto, Ont., Canada.
 1,278,416. Resilient tire filler. A. L. Austin, Cleveland, O.
 1,278,625. Heel of solid and sponge rubber. J. L. Forbes, Sturgis, S. D.
 1,278,664. Pneumatic cushion for crutch-head. A. R. Hunter, Welbeck, near Worksop, Eng.

THE DOMINION OF CANADA.

ISSUED JUNE 30, 1918.

- 184,714. Corset with elastic vest section. S. J. Newman, New Haven, Conn., U. S. A.
 184,753. Sheet rubber. The Gutta Percha and Rubber, Limited, assignee of W. Seward—both of Toronto, Ont., Canada.
 184,775. Pneumatic tire. M. S. Stevenson, Westminster, London, Eng.
 184,827. Life-preserving suit. A. L. Jaynes, Kansas City, Mo., U. S. A.
 184,829. Dust cap for tire-valves. H. P. Kraft, Ridgewood, N. J., U. S. A.
 184,830. Bottle cap with rubber ring. W. J. Nicholls, Winnipeg, Man., Canada.
 185,044. Eraser. E. G. Balch, Newburyport, Mass., U. S. A.
 185,054. Pneumatic tire. F. S. Bryant, Reading, Mass., U. S. A.
 185,060. Tire. J. H. De Long, North Troy, N. Y., U. S. A.
 185,092. Hair curler. M. J. Peppard, Minneapolis, Minn., U. S. A.
 185,126. Rubber-covered finger band. M. J. MacMahon, Niagara Falls, Ont., Canada.
 185,172. Vehicle wheel. E. Gasper, assignor of one-half to E. Mosser—both of Grass Valley, Calif.

THE UNITED KINGDOM.

ISSUED SEPTEMBER 4, 1918.

- 117,328. Rubber tire. J. C. Anderson, Cochran Hotel, Washington, D. C., U. S. A.
 117,261. Teat cup. Aktiebolaget Mjolkkningsmaskinen Omega, 101 Valhallgatan, Stockholm, Sweden.
 117,305. Garment-supporting waistband with elastic inserts. A. Carliss, 7 Lawrence street, New Oxford street, London, England.
 117,310. Artificial limb with rubber toe-piece. F. H. Critchley, 21 Great George Square, Liverpool, England.
 117,343. Compressed gas container of reinforced rubber. R. C. Jagger, 98 Gamborough avenue, Copner, and F. Jagger, Werneth Metal Factory, Lee street, Werneth—both in Oldham, England.

ISSUED SEPTEMBER 11, 1918.

- 117,346. Shaving brush with rubber protector on handle. A. R. Culmer, 48 Durham Road, Holloway, London, England.
 117,385. Tire. W. D. McNaul, 448 East Broadway, Toledo, O., U. S. A.
 117,403. Bottle stopper. Beaton, Clark & Co., Glass Works, George street, and F. Tweeddale, 40 Albany street—both in Rotham, England.
 117,416. Heels, heel tips, soles, and sole tips made of rubber molded with glass inserts for riveting studs thereon. F. W. Wood, 3 Raws street, Bank Parade, Burnley, Lancashire, England.
 117,542. Lining for turn shoes, with elastic portion to permit turning. E. A. Gardner, 22 Hampton Place, Brooklyn, N. Y., U. S. A.
 117,547. Artificial limb with rubber blocks between leg and footpiece. H. Vearsley, 33 Clifton Road, Eccles, Lancashire, England.

Chemical Patents will be found on pages 79 and 80. Machinery Patents on page 85.

ISSUED SEPTEMBER 18, 1918.

- 117,678. Diver's dress. H. Houdini, 394 East 21st street, Flatbush, Brooklyn, N. Y., U. S. A.
- 117,735. Twin-tire. H. Raflovich, 1301 Washington avenue, New York City.
- 117,740. Rubber-padded foot-caps for gas control. O. Millaire, Lambeth Infirmary, Brook street, Kennington, London.
- 117,773. Rubber tire and core. T. C. Watkins, 44 Warren avenue, Ingram, Pa., U. S. A.
- 117,778. Solid rubber tire. F. Atkinson, 89 Cornwall Road, Bayswater, London.
- 117,810. Valve for artificial denture dispensing with palate plate. A. C. S. Angel, Copenhagen, Denmark. (Not yet accepted.)
- 117,855. Waterproof clothing to substitute an umbrella. F. Hewett, 19 Kisdale Road, Anerley, London.

ISSUED OCTOBER 2, 1918.

- 117,849. Artificial foot. J. J. Stubbs, City Road, Cardiff.
- 117,933. Bootslee protector. C. W. Heidim, Reason Lodge, Windmill Road, Ealing, and A. U. B. Ryall, Glamorgan House, Brantford—both in Middlesex.
- 117,934. Exercising apparatus. A. Turio, 9 Via Orfice, Genoa, Italy.
- 117,966. Teats for feeding-bottles. F. R. Graham-Yoell, Dulham Towers, East Trinity Road, Leith.
- 117,977. Pneumatic tire. F. De Las H. Molina, 1 rue Martinez Molina, and L. B. Ocantarilla, 11 rue Ruiz Romero—both in Jaen, Spain.
- 117,979. Inhaler. E. C. Ingley, Woodville, Park Villas, Old Park Road, Roundhay, Leeds.
- 117,995. Tire valve. Dunlop Rubber Co., 14 Regent street, Westminster, and F. J. Keegan, Dunlop Rubber Co., Alma street, Coventry.
- 118,022. Rubber socket for receiving ferrule for screw stopper in hot-water bottles. C. H. Moor, 249 Victoria Park Road, South Hackney, London.
- 118,026. Pneumatic arm-rest for crutches. E. J. Harrington, 30 Neville street, Riverside, and J. McLoughlan, 38 Adam street—both of Cardiff.

THE FRENCH REPUBLIC.

PATENTS ISSUED (WITH DATES OF APPLICATION).

- 487,218. (October 16, 1917.) Demountable wheel-rim. E. G. Bridd.
- 487,231. (October 17, 1917.) Improvements in inner tubes. A. H. Shaw.
- 487,327. (October 29, 1917.) Mechanical eraser. J. Combes.
- 487,387. (November 2, 1917.) Improvements in garters. A. J. d'Ostrop.
- 487,451. (November 7, 1917.) Compound to stop leaks in pneumatic tires. Functure Tire Co., Limited.
- 487,518. (November 10, 1917.) Resilient wheel. F. Stizel.
- 487,519. (November 12, 1917.) Exercising apparatus. A. Turio, Genoa, Italy.

AUSTRALIA.

ISSUED JULY 2, 1918, TO AN AMERICAN FIRM.

- 4,617. Tobacco or similar package lining of tin foil with paper backing attached by rubber compound, to protect goods from atmospheric changes. Combinator Machine Co., assignee of J. Peterson, New York City, U. S. A.

ISSUED SEPTEMBER 10, 1918, TO AN AMERICAN.

- 5,713. Pneumatic tire tube. H. B. Wallace, Missouri, U. S. A.

NEW ZEALAND.

ISSUED SEPTEMBER 5, 1918.

- 39,727. Pneumatic tire. W. McEwen and W. C. S. Hosking—both of Waiuku.
- 40,305. Means for reinforcing fabric for insertion of valves in pneumatic tires, etc. Dunlop Rubber Co. of Australasia, Limited, 103 Flinders street, Melbourne, assignee of S. Beard, 27 Wright street, Middle Park—both in Victoria, Australia.

TRADE MARKS.

THE UNITED STATES.

- NO. 94,828. The words **BULL DOG** followed by representation of head of a bulldog—dog tubs. W. S. Nott Co., Minneapolis, Minn.
- 104,845. Conventional representation of Saturn and its rings above the word **SATURN**—belting of fabric and rubber. The Gutta Percha & Rubber Manufacturing Co., New York City.
- 107,944. Representation of a stenciled impression comprising the word **MAGNOLIA** within a diamond—rubber packing. Jenkins Rubber Co., Elizabeth, N. J.
- 109,646. Representation of a monkey clinging to a roll on which the word **EVERGRIP** appears; the word above the words "Holding on to a Good Thing"—self-vulcanizing patches for mending tires, rubber boots, hot-water bottles, etc. The Ever Grip Co., St. Louis, Mo.
- 110,414. Profile representation of a soldier beneath the words **THE "CADET"**—fountain pens. Marshall Field & Co., Chicago, Ill.
- 110,426. Representation of an Indian's head—self-vulcanizing tire-patches. M. J. Cagle, San Francisco, Calif.
- 110,854. Representation of a bulldog looking through a tire—pneumatic tires, tubes, and outer casings of rubber or rubber and fabric. Braender Rubber & Tire Co., Rutherford, N. J.
- 111,286. The words **RED LINE** with a horizontal bar superimposed—rubber tubes, fabric and rubber reliners, and fabric and rubber patches. Red Line, Inc., Grand Rapids, Mich.
- 111,428. Representation of an acorn on a shield—springs, inhalers, chloroform masks, etc. Doniger & Co., Inc., New York City.
- 111,628. The words **RUXO**—footballs, basket balls, and volley-balls. Rawlings Manufacturing Co., St. Louis, Mo.

A NEW ENTERPRISE IN WHICH AMERICAN, CANADIAN AND JAPANESE INTERESTS COMBINE has been established in the International Co., with headquarters at Kobe, Japan. The concerns interested are Frank Waterhouse & Co., of Vancouver and Seattle, Iwai & Co., of Kobe, I. Shii, of Kobe and Senda, and Barnett & Co., of Calcutta. These concerns are shippers, importers and exporters of crude rubber, etc. C. E. Harvey has been appointed general manager of the new company.

Review of the Crude Rubber Market.

Copyright, 1918.

NEW YORK.

REVIEW of the October market reveals but little activity, and at times, positive dullness in crude rubber of all grades. Manufacturers' orders for allocated and free rubber have been infrequent and unimportant in volume, reflecting the disturbed conditions prevailing at the mills through influenza and shortage of labor. Despite the marked inactivity, prices have been generally firm, both here and in the Far East. Government control of free rubber transactions, went into effect last month and resulted in restricting business in this commodity to some extent. Peace talk had little effect on the market other than giving added strength to the situation, both locally and at primary sources.

PLANTATIONS.—Allocated rubber, although in small demand during the month, was firm, the lowest price quoted for Latex being 37 cents and the highest 42 cents. Ribs ranged from 35½ cents to 40 cents. Free rubber prices ranged from 58½ to 62 cents for Latex and 57½ to 61 for Ribs.

PARÁS.—Prices on allocated Pará grades varied but little, the high and low being as follows: Upriver fine, 56 to 58 cents; Upriver coarse, 30 to 32 cents; Upper cauchó ball, 30 to 32 cents; Cametá, 21 to 22 cents. Prices on free rubber ranged from 62 to 66 cents for Upriver fine, 35½ to 37½ cents for Upriver coarse, 35 to 36 cents for Upper cauchó ball, and for Cametá, 25 to 29 cents.

CENTRALS.—All grades have been firm despite the small demand. The slight activity noticeable during the month is said to be the result of substantial orders placed by the manufacturers with dealers.

STATISTICS.—The total United States imports for September, 1918, were 5,151 tons, compared with 13,664 tons for the corresponding period in 1917. Plantation imports for September were 4,613 tons, compared with 11,192 tons last year. Imports of Pará rubber for September, 1918, were 311 tons, compared with 2,133 tons for the corresponding period in 1917. London and Liverpool imports of raw rubber for September were 3,535 tons, compared with 4,700 tons last year. Reexports for September were 892 tons compared with 1,870 tons a year ago.

NEW YORK SPOT QUOTATIONS.

Following are the New York spot quotations, one year ago, and allocation and free rubber prices on October 26. Government option prices, c. i. f. New York are given in the last column.

RECLAIMED RUBBER.

The interest in reclaimed rubber during the last month has been of a routine nature. Rubber manufacturers have experienced unusual difficulties in plant operation on account of the scarcity of labor and the inroads of influenza. Business in reclaims is therefore expected to be more or less quiet until the prevailing conditions change for the better. Prices are practically unchanged.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert B. Beers, broker in crude rubber and commercial paper, No. 68 William street, New York, advises as follows:

During October the demand for commercial paper has been light, due largely to the drive in the Fourth Liberty Loan, but out-of-town banks have been buying moderately, the best rubber names going at 6½ to 6¾ per cent and those not so well known 6½ to 7 per cent. Now that the loan drive is out of the way, the general demand for commercial paper should improve, but rates are likely to continue fairly high for the present.

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report (September 13, 1918): The weekly rubber auction held yesterday and today saw a much improved demand and a welcome rise in prices. Fine ribbed smoked sheet sold up to 55 1/2 cents per pound (8 1/2 cents above last week's best), but the bidding for this grade was somewhat erratic, only a very few lots being fetched more than 54 cents. The demand for sheet raised off in the latter part of the sale, and the highest paid in the concluding stage was 52 1/2 cents. Fine pale crepe was in good demand throughout, up to 55 cents, which shows an increase of 7 1/2 cents on the week. Lower grades were well competed for, at an advance averaging four to five cents. Small quantities of plain smoked and unsmoked sheet found buyers at fairly good prices. Some 676 tons were sold, out of 867 tons catalogued.

The following was the course of values:

	In Singapore, per Pound. ¹	Sterling Equivalent per Pound in London.
Sheet, fine ribbed smoked	48c at 55 1/2 c	1/6 1/2 at 1/8 5/8
Sheet, good ribbed smoked	38 at 45	1/3 1/2 at 1/4 3/4

THE MARKET FOR RUBBER SCRAP.

Copyright, 1918.

NEW YORK.

THE market for rubber scrap has, during the last month, remained very inactive. The dealers do not feel that there is a sufficient margin of profit in transactions at present prices, while the reclaimers see no reason for bidding higher than the current quotations. So everything is practically at a standstill. The few trifling changes that we note can hardly be considered as indicating what will happen shortly, and yet we believe that the stagnancy which has characterized the situation for some time will not last much longer. A break in the dullness would be welcomed.

BOOTS AND SHOES.—A slight demand was reported at 8½ to 8½ cents instead of the previous quotation of 8½ to 8½ cents. The increase was too small to stimulate a willingness to sell.

TIRES.—Neither buyers nor sellers have shown the smallest interest. Prices remain unchanged.

MECHANICALS.—No demand to record. Insulated wire stripping fell one-half cent. Other quotations remain unchanged.

TIRES.—Prices continued to drop, except for white and mixed tires, each of which increased one-quarter cent. Transactions were negligible.

STATISTICS.—The London and Liverpool imports of waste and reclaimed rubber for August were only 1,000 pounds, while the exports were 635,800 pounds, value £19,471.

NEW YORK QUOTATIONS FOR CARLOAD LOTS DELIVERED.

OCTOBER 26, 1918.

Prices subject to change, without notice.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright 1918.

NEW YORK.

WHILE conferences have been held for the purpose of agreeing on a price-fixing plan for American cotton, no definite policy has been announced. A study of actual costs of raising cotton was recently made by the American Exchange National Bank of New York City, the condensed results being as follows: Alabama, 20 cents; Arkansas, 23½ cents; Georgia, 21 cents; Louisiana, 18 cents; Mississippi, 25 cents; North Carolina, 24 cents; Oklahoma, 17½ cents; South Carolina, 16 cents; Tennessee, 26 cents; Texas, 17½ cents.

Although the market shows a decline since last month, the technical position of the commodity is said to be strong at this writing. On September 26 there was considerable activity among buyers due to predictions of frosts in Texas and middling uplands spot advanced to 32.40 cents, compared with 35.15 cents a month ago. The market closed October 30 at 30.75 cents.

EGYPTIAN COTTON.—The British Board of Trade announces that prices on orders placed with the Egyptian Cotton Control Commission or with Alexandria export houses shall be those ruling for each government type at the time the order is registered, provided the quantity does not exceed the amount allocated to the buyer.

The Egyptian Cotton Control Commission is authorized to charge 1½ per cent on the free on board prices of each type of cotton when orders are sent direct to them. If placed with the Commission through Alexandria export houses the commission will be paid to the house employed.

The 1918 crop conditions, while favorable at this time, will not equal last year's production, due to the decrease in acreage. The following are the planting percentages:

	1918.	1917.	1916.
Sakellarides.....	7.4	67.5	63.4
Ashmouni (Upper).....	20.9	22.0	20.8
Ahli-Assli-Nubari.....	5.9	10.0	13.9
Abassi-Joanovich Various.....	0.8	0.5	1.9
	100.0	100.0	100.0

SEA ISLAND COTTON.—Southern markets have been generally quiet as farmers refuse to sell unless they can obtain an equivalent of 70 cents cost insurance freight, for Extra Choice and Fancy. The growers' report is convincing evidence that this year's crop will be very small. Up to October 18, only 9,789 bales have been ginned compared with 43,691 bales last year.

DRILLS, DUCK, OSNABURGS AND SHEETINGS.—These materials are under government control at fixed prices ruling until November 16. Deliveries to the Government of the new raincoat cloth—39-inch and 64-68-inch, 4,000-yard sheeting—are extended through to the end of January.

TIRE FABRICS.—The market is quiet and inquiries are few and far between. Fabric mills are busy on government orders running to next spring. Prices are unchanged.

THE MARKET FOR CHEMICALS AND COMPOUND-ING INGREDIENTS.

Copyright, 1918.

NEW YORK.

LACK of interest in base metals characterized the market. There will probably be no change in the price of copper after November 1, although one had been expected. Tin is inactive and it is reported that fixed prices will probably not be announced. Government consumption of lead continues heavy, its general distribution being under strict control. There has been a slight decline in antimony.

The market for rubber chemicals has been quiet due to the Liberty Loan, peace talk, and influenza. Prices have held firm with a tendency toward higher prices for aluminum flake, barytes, lithopone, etc., due to higher cost of labor, freight and other things. Trade should open up in the near future, except in certain lines under government regulation.

ANILINE OIL.—A continuous demand is depleting the available stocks, so the undertone is firm.

BARYTES.—Twice as much as the present consumption was the average, but, in spite of that, increased prices are expected on account of the higher costs of production.

CARBON TETRACHLORIDE.—By its control of chlorine and its

products the Government now regulates business in this commodity. There is little to be had.

LITHOPONE.—Lack of cars and of labor is giving trouble to the manufacturers, who can easily sell all that they can produce. Prices remain unchanged.

SULPHUR FLOUR.—Prices for delivery after January 1 have not been quoted, but it is thought that they may be a trifle lower.

SULPHURIC ACID.—There is the keenest demand for what little is obtainable, as the Government regulates not only the production but the distribution. The new price schedules are now applicable.

TALC.—The demand is fair, but producers find it hard to meet it, owing to lack of labor. Spot deliveries are at a small premium.

TAR AND PITCH.—Tar has advanced 25 cents a barrel. Demand, chiefly for government needs, is strong, and the stocks are small.

WHITING.—Producers seem to find it difficult to provide firms doing work for the Government with the quantities they need. Other concerns must be satisfied with what they can secure. Prices are unchanged.

ZINC OXIDE.—The demand is better than for other pigments, government requirements are increasing. No change in price.

TABLE OF CONTENTS ON LAST PAGE OF READING.

WAR SERVICE AND PEACE SERVICE.

THE present War Service Committee of the American rubber trade represents a perfection of organization of which few industries can boast. In its personnel of more than one hundred men—leaders in rubber manufacture, in crude and reclaimed rubber, and in the distribution of the rubber products—it embraces every division of the industry. The committee, notable because of the accomplishments of its members in the normal fields of endeavor, is especially distinguished by the work it has done in putting the whole industry upon a war basis. It is no exaggeration to say that no half dozen industries combined offered so many perplexing problems or so many troublesome details, all of which were solved and adjusted with eminent fairness and in record time. With peace in sight the trade is faced with problems of even more gravity than those presented by the war, for upon their right solution depends its future.

It took from four to six months to put the rubber industry on a war footing. Now that it is thoroughly organized, and accustomed to working for the general good, it will be its own fault if many troublesome customs and handicaps of the past again come into existence. For example, individual initiative would not be

hampered nor manufacturers injured if many partially obsolete types of goods were dropped, others standardized, and specialties given over to those who created them.

There is also in sight the very vital readjustment of labor and wages that will come as a part of the reconstruction. The cost of living will not become less for a time at least, and war wages are likely to be demanded and the strike threat freely employed.

It has been hinted also that international free trade may be one of the peace articles finally agreed upon. If Germany were democratized and repentant, it is hard to imagine Belgians and French weeping over the graves of the mangled babies, and buying German-made nipples. Nor can we conceive of British householders using German garden hose with its constant suggestion of flame throwers and poison gas. Even with custom houses abolished on all borders it would be years before German goods of any sort would find buyers. The result would be that the United States would become the dumping ground for everything German; for not having suffered in any such measure as our Allies, we would forget more easily. As in the past, the shopper would not know or care as to the origin of rubber goods provided they were attractive and reasonable in price.

On the other hand, for three years markets formerly supplied by England, France, Italy and Belgium became our own because of the war. It might, therefore, be unfair and impolitic to erect a tariff wall about our own country and still try to get the lion's share of the world's trade. It was just that temptation that led Germany down into the pit.

From the beginning, questions of many sorts are likely to fall to the War Service Committee for consideration. This is no surmise, for the Government has already indicated that upon just such committees will fall certain details of reconstruction. Many problems, however, are international in their scope and cannot be settled by any one country, no matter how strong or wise. If a league of nations is formed, scores of economic questions will be settled and some of them possibly to the disadvantage of the rubber trade. That is, unless it is alert in forecasting conditions and timely in its representations.

Looking at the matter broadly every country will be faced by similar problems. That decisions may be made after full knowledge and fairly, an international rubber committee created from the membership of existing rubber organizations representative of all the allied nations is therefore needed. America, the biggest, the best-organized, should take the lead in forming such a committee, calling conferences, and taking up questions in advance of the time of solution. The rubber industry, potentially one of the most important, should have its place, if not at the peace table, at least in the adjustment councils that settle after-war conditions. Such a committee might decide that the "right of self-determin-

ation" as relating to nations big and little may possibly belong also to corporations and to individuals. Then manufacturers and shipowners could give employment to whom they chose and workmen would be free to join unions or not without interference.

The rubber trade pays big freights on crude rubber, compounding ingredients and manufactured goods. Before the war German ocean lines delivered goods to certain markets at prices none could compete with because of governmental subsidies. Possibly the "freedom of the seas" contemplates a fair adjustment of rates that will do away with this evil.

Standardization as a result of the war necessity has made marvelous progress. Perhaps peace will demand international standardization. If this is toward the world's rubber trade it has much work before it, for in many lines it will be revolutionary.

Brazilian rubber producers, together with English, American, Dutch, French, Japanese and Belgian rubber planters, would have an unexampled opportunity to arrange for fair and adequate supply, standard grades, and perhaps come to some understanding as to minimum and maximum prices and restrictions of product.

German methods wherever they affect the rubber trade, the counterfeiting of trade-marks, the theft of patents, the sale of products at prices below cost, forced contracts with neutrals whereby German goods only shall be purchased for a period of years after the war, and plans of German manufacturers and exporters to use Swiss and other neutral registration for German goods, could easily be balked by an international committee.

Moreover, the international trade rivalries, misunderstandings and jealousies that are sure to crop up may be done away with through personal contact. America is coming out of the war the richest of all the nations involved. Nations rich and poor owe her billions. It is a dangerous position for any nation to be in. That is why the rubber and other trades should affiliate closely with their confreres the world over, and keep alive the spirit of friendship which the war has brought about.

BOOM IN RUBBER TO COME.

A TREMENDOUS expansion in American industry is sure to come, once peace is here and the problems of reconstruction settled upon. America's part in feeding the world assures prosperity for the farmer. Stocks in the hands of the wholesalers and retailers are small. Thus our domestic market will call for rubber goods as never before. Moreover, the shops of Europe are empty. Belgium, France, and indeed all of the Allies are short of goods. Then, too, Germany, Austria-Hungary with its new republics, Turkey and Russia, are sure to be in the market ere long. Great although the American rubber trade is, its capacity is likely to be tested to the uttermost.

PLANNING THE WORLD'S TRADE.

THE Teuton pre-war policy of industrial penetration was successful in enabling Germany to obtain an exceedingly dangerous hold on the chemical, dye, and other American Industries; on the Australian zinc industry; in securing a practical monopoly of wolfram, manganese ore, copra, oil seed, and practical control of the French bauxite mines. These are but a few of the instances of the burrowing methods that resulted in a stream of valuable imports pouring into Germany, and leaving again in a manufactured form to deluge the world. In 1913 the total imports amounted to almost seventy-three million tons, valued at some \$2,750,000,000.

To-day Germany, staggering under huge debts, in spite of revolution, and facing a bitterly hostile world, still hopes for world domination. The great industries are, to be sure, for the moment, paralyzed. Even before the armistice few rubber plants operated, four-fifths of the textile factories were idle, while no less than one-third of the small plants had been closed. The merchant marine, too, was in sorry plight, two-thirds of the vessels seized or locked in neutral harbors, which more than offset the trade in the Baltic.

In addition to all this, German manufacturers are faced with grave labor problems. The demands of war, continually depleting their working forces, caused vacancies which were but partly filled, and even then by persons not only inferior in skill but also in general health. As for the returning soldiers it is doubtful if they will be the obedient bond-slaves they were prior to 1914. These adverse circumstances, however, have whipped the industrialists to unheard of endeavor.

A German union of technical and scientific societies aims at a closer cooperation between science and industry; there still remain the many consolidations in nearly all industries; there also is the ministry of economic affairs to reestablish foreign trade; the Eastern Territories Neo-German Economic Society; the association for the promotion of the export of German goods under guise of neutral products, and the huge combine to exploit various industries in foreign countries.

All of this is known to the Allies and there has been a general overhauling of pre-war trade tactics and a demand for protection of home industries.

France has decided to recast all old trade compacts and from April, 1919, will do business on equal terms. Her chemists and industrial leaders have joined forces to restore and enhance her commercial prosperity.

England is instituting a comprehensive system for inventorying the wealth of her colonies, with plans to make herself and them independent of foreign countries for any article raw or manufactured.

In America the work of building up new industries to provide goods formerly supplied by Germany has gone on apace. Much thought and labor is also being expended on the task of retaining and expanding the busi-

ness brought by the war. The same is true of Italy, Japan and to a smaller extent of the South American countries.

International Free Trade may be "sound," but at present it is not very loud.

CRUDE RUBBER A "KEY MATERIAL."

"KEY INDUSTRIES" are given much attention in Great Britain at present. For example, dye manufacture is the key industry to textile and paper production. Germany once possessed this key, but for various reasons was unable to use it from 1914 up to the present time. Pass-keys were therefore made in both Great Britain and the United States and the industries unlocked for all time.

Exhibitions of "Key Materials" are now on in various great English centers. Of the many materials shown, that of paramount interest is crude rubber. As matters stand, crude rubber actually is represented by several keys. Great Britain of course holds the biggest, the Dutch East Indies and Brazil each hold big ones, while those of lesser size dangle from the fingers of French Indo-China, the Central American countries, and a very tiny one from the Philippines.

Nor are we without rubber key materials here in the United States. Reclaimed rubber is one. Neither should we forget that the great guayule project goes on apace and will one day be a fairly sizable key. Take it all in all the crude rubber keys are in good hands and if any holders, for good and sufficient reasons, lock their doors, others will open the wider.

THE BAFFLING BOTANY OF RUBBER.

AT the Centennial Exposition of 1876, Austin G. Day, one of the most enterprising and successful of rubber men, showed a collection of "rubber-producing plants." The collection consisted of sixteen varieties, with the following names:

<i>Ficus Brasiliensis</i>	Brazil
<i>Ficus lucida</i>	Brazil
<i>Ficus macrophylla</i>	Australia
<i>Ficus Australis</i>	Australia
<i>Ficus elastica</i>	East Indies
<i>Ficus rigida</i>	East Indies
<i>Ficus religiosa</i>	Palestine
<i>Euphorbia monstrosa</i>	Cuba
<i>Euphorbia triangularis</i>	South Africa
<i>Euphorbia Mackaii</i>	Java
<i>Euphorbia splendens</i>	Mexico
<i>Euphorbia punicia</i>	Mexico
<i>Monstera deliciosa</i>	Brazil
<i>Galipia odoratissima</i>	Brazil
(more correctly called <i>Cusparia</i>)	
<i>Aralia Cookii</i>	Brazil
<i>Pereskia grandiflora</i>	Mexico

Of all that list just one, *Ficus elastica*, has actually served as a commercial source of rubber. To be sure, nearly all the species of *Ficus* and *Euphorbia* bear latex, but few have furnished rubber which has been sold in the markets of the world.

The other four species belong to families which do not ordinarily produce latex at all, and no scientific authority includes either of them among rubber-bearing plants. All of which simply proves that Mr. Day knew more about rubber in the factory than in the tree.

Such a mistake is not at all surprising to one who reviews the assertions which have been made at different times by men of high rank as botanists. The Kickxia of Africa was described by the authorities of Kew Gardens in England from the leaves of one species and the flowers of another. An English botanist, sent to Central America to gather plants of *Castilloa elastica* for experimental cultivation in Ceylon, got a plant which may have been a species of *Perebea* or a species of *Castilloa*, but which certain was not *Castilloa elastica*.

Nor has the day of mistaken and careless naming gone by. Quite recently eminent authors have spoken of the Caucho rubber of South America as being the product of the *Castilloa elastica*. Yet it was long ago described in detail by Warburg as being the product of a very different tree, the *Castilloa Ulei*.

AT THE INDUSTRIAL CONFERENCE DECEMBER 3RD TO 6th there will assemble at Atlantic City the most representative body of business men that the world has yet seen. Called together by the Chamber of Commerce of the United States will be delegates from 300 groups of interests. The discussions will embrace the many and varied problems of reconstruction, as for example, cancellation of contracts, continuation of government control, labor, conservation, prices, credit and similar subjects. In all of these questions the rubber trade has a very live interest, and from the conclusions reached is sure to derive much benefit.

GERMAN PROPERTY IN THE UNITED STATES AND ITS Territories has been taken over and sold by the Alien Property Custodian. The money derived from the sales runs into hundreds of millions of dollars. Most of it is German money. If, however, an American can prove that any portion of it is his, he has the privilege of entering a claim for it within six months of the close of the war. It is possible also that war damages may also be settled from this fund, as part of the property sold once belonged to the sometime Imperial German Government.

TWENTY BIG CARS STRIPPED OF THEIR TIRES BY THIEVES in twenty days is the record of a Western city. As it is almost impossible to identify tires once stolen, owners are adopting the plan of branding both tires and tubes with their initials. This is of great assistance to the police in recovering stolen tires. Branding the thieves would be better.

Why the Red Cross Needs Hundreds of Millions.

RELAXATION OF REGULATION OF INDUSTRIES.

FOLLOWING the signing of the armistice with Germany, the War Industries Board issued a new order, modifying restrictions and curtailments, of which we publish the section that interests our readers:

SECTION 3.

Restrictions upon industries and manufacturers in their production, or in their consumption of materials for commodities hereafter in this section enumerated, as such restrictions are expressed in orders and circulars issued by this Division, are hereby so modified that such restrictions for the respective periods provided for in such several orders and circulars shall be less than the restrictions to the extent of fifty per cent of such restrictions. The commodities referred to are (among others) as follows: clothes wringers, baby carriages, bicycles, hand stamping and marking devices, sporting goods, pneumatic automobile tires.

The production of tire manufacturers who have been operating on the basis of a 50 per cent curtailment of the monthly average for the eighteen months ended June 30, 1918, has, as of November 15, been increased to 75 per cent. All restrictions curtailing the production of rubber articles, except automobile casings and tubes under six inches, have been withdrawn.

EXPORT LICENSE PROCEDURE FOR SAMPLES.

The War Trade Board announces the following regulations governing the exportation of samples to be used in the solicitation of orders:

1. Samples of no commercial value of any commodity may be exported in the personal baggage accompanying a traveler without an individual export license, under special export license RAC-49, issued to the Customs Service. (See W.T.B.R. 195, issued August 13, 1918.)

2. Samples of no commercial value of commodities *not* on the Export Conservation List may be exported by mail without an individual export license, under special export license RAC-52 issued to the Postoffice Department, to the following countries: Abyssinia, Afghanistan, Argentina, Belgium, Bolivia, Brazil, China, Chile, Colombia, Costa Rica, Dominican Republic, Ecuador, Egypt; the colonies, possessions, and protectorates of Great Britain; the colonies, possessions, and protectorates of France; Guatemala, Haiti, Honduras; the colonies, possessions, and protectorates of Italy; Japan; the colonies, possessions, and protectorates; Liberia, Monaco, Nepal, Nicaragua; the colonies, possessions and protectorates of the Netherlands; Oman, Panama, Paraguay, Peru, Salvador, San Marino, Siam, and Uruguay, excluding any portion of the foregoing occupied by the military forces of Germany or its allies. (See W. T. B. R. 246; issued October 9, 1918.)

3. Samples of no commercial value of any commodity may be exported by mail without an individual export license, under special export license RAC-52, to the United Kingdom, France, Italy and Japan, their colonies, possessions, and protectorates, excluding any portion thereof occupied by the military forces of Germany or of its allies. (See W. T. B. R. 246, issued October 9, 1918.)

4. To facilitate further the exportation by mail of samples of no commercial value, when an individual export license is required, the War Trade Board, hereafter, will consider issuing licenses of a special type, valid for three months after issuance, permitting the exportation, by mail only, to one or more consignees, whose names need not be specified in the application for the license, of a single parcel or an unlimited number of parcels of samples of no commercial value to be used in the solicitation

of orders. Such licenses will not be granted for shipments of samples to persons in enemy or ally of enemy countries; or to persons with whom, the applicant has reason to believe, trade is prohibited by the Trading with the Enemy Act. (For particulars regarding applications for licenses, see W. T. B. R. 280, issued October 25, 1918.)

IMPORTANT PUBLICATIONS ON FUEL TECHNOLOGY.

Estimates made earlier in the fuel year that approximately 160,000,000 car miles, equivalent to a 5 per cent increase in production, would be saved in the coal year through the operation of the zone system for the distribution of bituminous coal are being more than realized. The nation's supply is now such that with patriotic economy it will probably be sufficient for the winter's requirements. There must, however, be frugality in the use of electricity, gas and coal, and intelligent firing of furnaces and stoves. To this end the United States Fuel Administration and the Bureau of Mines have issued numerous pamphlets and scientific papers on fuel technology and conservation which are of great value to the operator of every power plant, large or small. If all would substitute scientific methods for the haphazard practices which have too often been the rule, the possibility of shut-downs due to lack of fuel could probably be definitely averted.

AN INDUSTRIAL RECONSTRUCTION CONFERENCE.

A war emergency and reconstruction conference of the war service committees of the various American industries has been called by the Chamber of Commerce of the United States to be held at Atlantic City, December 4, 5 and 6. The subjects to be discussed include reconstruction; industrial relations; raw materials and their control; price control; economic legislation affecting combinations; export and import operations; finance, etc., and all information adduced will be placed at the command of the Government. The several war service committees, including that of the rubber industry, will confer with the commodity chiefs of the War Industries Board, and it is hoped that definite recommendations can be formulated covering the reconstruction period, with the possibility of creating an executive committee empowered to gather data and to function with industries to meet the many problems that the nation's industries will be called upon to solve with the end of the war.

LIBERTY LOAN OVERSUBSCRIBED NEARLY A BILLION.

Early estimates regarding the oversubscription of the Fourth Liberty Loan have proved to be far too conservative. Total subscriptions amounted to \$6,989,047,000, or 164 per cent. more than the \$6,000,000,000 sought to be raised. Every Federal Reserve District exceeded its allotted quota. It was the greatest war loan ever floated by this or any other nation. Through the four Liberty Loans and War Savings Stamps the country has raised a total of \$17,852,000,000, not including unaccepted oversubscriptions.

Bonds of the Fifth Loan to cover the remaining war expenditures and to be offered in the spring, will be of short maturity, probably five years or less.

CUBA OVERSUBSCRIBES FOURTH LOAN.

Patriotic Cuba oversubscribed her \$6,000,000 quota for the Fourth Liberty Loan by \$4,752,850. There were 23,000 subscribers.

ENEMY-OWNED CONCERNS AND INTERESTS TO BE SOLD.

German owned or controlled interests in the following concerns are to be sold at public auction by the Alien Property Custodian A. Mitchell Palmer, in accordance with the Government's plans for their complete Americanization:

The Boonton Rubber Manufacturing Co., Boonton, New Jersey, manufacturer of composite insulation; The Bayer Co., Rensselaer, New York, manufacturer of drugs and dyestuffs, which includes the Synthetic Patents Co., owner of organic accelerator patents; the Goetze Gasket and Packing Co., New Brunswick, New Jersey, manufacturer of gaskets and packing devices; the Schaeffer & Budenberg Manufacturing Co., New York, manufacturer of engineering instruments; the J. P. Devine Co., Buffalo, New York, manufacturer of vacuum dryers; the Werner & Pfleiderer Co., Saginaw, Michigan, manufacturer of machinery; Robert Soltan & Co., Inc., Mamaronock, New York, manufacturer of gutta percha specialties.

BASILAN PLANTATION TAKEN OVER.

The only *Hevea* plantation that is producing rubber and is in United States territory is the Basilan Plantation on Basilan Island, Mindanao, Philippine Islands. Most, if not all, of the stock was owned by Germans and has been taken over the Alien Property Custodian.

BITUMINOUS STORAGE LIMIT OFF.

All storage restrictions on bituminous coal were removed on November 22 by the United States Fuel Administration in conformity with the action of the War Industries Board in cancelling its preferential industries list. Anthracite coal is not affected, however, by this ruling.

Every industry and every householder in the country now may store as much bituminous coal as desired or obtainable, as the action of the War Industries Board removes the necessity for the Fuel Administration to distinguish longer among different classes of industrial plants.

The restrictions just raised provided for the accumulation by the consumers in the preference classes defined by the War Industries Board of reserve stocks of bituminous coal, in accordance with their location in relation to various mine fields and their classification on the preference schedule.

WITHDRAWAL OF REGULATIONS AFFECTING THE EXPORTATION OF RAW COTTON.

The War Trade Board, in cooperation with the Committee on Cotton Distribution of the War Industries Board, makes the following announcement:

On and after December 2, 1918, no individual licenses will be required for the exportation of raw cotton to Great Britain, France, Italy, Belgium or Japan. A special export license (No. RAC-57) will be issued to the proper customs officials at points of exit, who will be authorized to pass shipments in accordance therewith.

The regulation governing exports of raw cotton to Spain (W. T. B. R. 319, November 15, 1918), whereby the quantity exportable to Spain was limited and allotted among the various shippers, is withdrawn, effective November 22, 1918, and applications will be considered looking toward the granting of licenses freely.

Applications to export raw cotton to other destinations will be considered and granted freely, and where agreements exist, international licenses will be granted in accordance therewith.

The regulation affecting the exportation of raw cotton (W. T. B. R. 265, October 11, 1918), which required that the grade and staple be specified on applications to export raw cotton and that the applicant also disclose the existence of an actual sales contract, or that there had been a freight allotment or engagement, is withdrawn, effective November 22, 1918.

THE WAR AND BRAZILIAN RUBBER.

The great changes brought about by the world war, and the losses sustained by German traders in Brazil are reported by "Wileman's Brazilian Review," as follows:

Before the declaration of war by Brazil against Germany, in spite of all disabilities, enemy traders succeeded in shipping 12.7 per cent of the crop in 1915-16, 6.7 per cent in 1916-17, but only 176 tons, or 0.6 per cent in 1917-18, and even that insignificant quantity prior to the declaration of war by Brazil against Germany on October 26, 1917. Since then no enemy rubber has been shipped at all.

The way in which both Allied and Brazilian trade has benefited by the restrictions placed on enemy traders is shown by the progression of the coefficient of exports of Allied traders from 48.8 per cent of the crop in 1915-16 to 51.1 per cent in 1916-17, and 52 per cent in 1917-18, and of the coefficient of Brazilian and Portuguese exporters from 23.9 per cent in 1915-16 to 31.6 per cent in 1916-17 and 33.0 per cent in 1917-18, inclusive of small shippers practically all Brazilian or Portuguese.

The term "Allied" is used merely to distinguish between Brazilian and Portuguese and British, American and French shippers.

Before the war, German shippers accounted for 61.6 per cent of the crop and some idea of the losses their traders must have suffered can be gathered from contemplation of the now total suppression of this branch alone of their overseas trade.

Since the incorporation of Suter & Co. with Stowell Bros., the coefficient of British exporters has steadily improved from only 11.5 per cent (excluding Suter & Co.) for 1915-16 to 28.9 per cent (including Suter & Co.) for 1916-17 and 26.4 per cent for 1917-18. Among British houses Stowell Bros. now rank first with 19.2 per cent of the 1917-18 crop, followed by Suarez Bros. with 4.7 per cent, and Adelbert Alden with only 2.5 per cent against 7.5 per cent for 1916-17 and 6 per cent for 1915-16.

The only American house of importance, the General Rubber Co. of Brazil, likewise improved its position from 20.9 per cent of the 1915-16 crop to 20.4 per cent in 1916-17 and 21.1 per cent in 1917-18, the largest coefficient of all.

The French house of Fradelizi & Co. shows improvement from 0.5 per cent for 1915-16 to 2.4 per cent in 1916-17 and 4.5 per cent for 1917-18.

Exclusive of small unspecified shippers, the largest Brazilian-Portuguese exporter of the 1917-18 season was again Tancredo Porto with 6.8 per cent of the crop, as against 8.7 per cent for that of 1916-17 and 5.1 per cent in 1915-16. The next largest was J. Marques & Co., with 6.2 per cent, as against 14.4 per cent in 1916-17 and 11.8 per cent in 1915-16. Pires Teixeira and J. C. Araujo both lost ground, but two new comers, J. A. Mendes and Chiamie & Co. (previously included among small shippers), accounted between them for 10 per cent of the crop, besides the Bank of Brazil with 3.0 per cent and "small" unspecified shippers with 6.6 per cent as against 6.7 per cent in 1916-17 and 12.7 per cent in 1915-16.

The improvement in the coefficient of transit rubber (Peru) from 2.4 per cent in 1915-16 to 5.3 per cent in 1916-17 and 7.8 per cent in 1917-18 is remarkable in view of the distance, over 1,000 miles, between Pará and Iquitos, now cut off from direct communication with either Europe or the United States.

Restriction of imports by the United States dates from May 6, 1917. During the first half of the 1917-18 crop, exports from the Amazon to the United States, in spite of the falling off of 1,000 tons in entries, were only 594 tons under those of the previous season. During the next half-year exports to the same destination show a tremendous shrinkage of 9,315 tons or 61.3 per cent compared with the same period 1916-17. It is a healthy sign to note that from 2,400 tons last year, receipts at Pará and Manaus dropped in July to only 620 tons and stocks from 8,145 on July 1 to 6,807 on August 1.

SOME RAINCOAT MAKERS ACQUITTED.

The Kenyon Co., Brooklyn, New York, charged with sending defective raincoats to the Army, was exonerated by the verdict rendered in its case on November 9, both as to the corporation and its employees. The blame for permitting defective raincoats of this company's manufacture to be sent to France is laid to the Quartermaster's Department of Army, since it was shown by the evidence that laxness of inspection therein created conditions worse than in the manufacturing establishments. Government inspectors were found to be untrained for the work and careless in inspection.

Harry E. Lazarus, another raincoat maker, on trial under the Sabotage Act, and also charged with having bribed Charles L. Fuller, an inspector of the Quartermaster's Department, to pass defective raincoats, was acquitted on November 19, for lack of evidence. Inspector Fuller, however, is under arrest and awaiting disposition of his case by Federal authorities.

RUBBER MEN ACTIVE IN WAR WORK DRIVE.

The United War Work Campaign of Greater New York was conducted last month for the purpose of raising funds for the following organizations:

Y. M. C. A., Y. W. C. A., National Catholic War Council (K. of C.), Jewish Welfare Board, War Camp Community Service, American Library Association, and the Salvation Army.

In this drive the rubber industry was represented by the following committee:

CHAIRMAN.

Bertram G. Work, The B. F. Goodrich Co.

VICE-CHAIRMAN.

F. E. Titus, The B. F. Goodrich Co.

DIVISION CHAIRMEN.

TIRES: Horace De Lesser, Ajax Rubber Co., Inc.

CRUDE RUBBER: W. J. Kelly, Poel & Kelly.

BOOTS AND SHOES: Homer E. Lawyer, United States Rubber Co.

MEDICAL RUBBER GOODS: S. H. Jones, United States Rubber Co.

MECHANICAL RUBBER GOODS: Henry Spadone, Gutta Percha and Rubber Manufacturing Co.

RECLAIMED RUBBER: Clarence H. Low, United States Rubber Reclaiming Co., Inc.

HARD RUBBER: F. G. Achelis, American Hard Rubber Co.

UNITED WAR WORK FUND IS \$203,179,038.

On November 25 subscriptions to the United War Fund were announced as amounting to \$203,179,038, or \$32,679,038 in excess of the amount originally asked by the seven war relief organizations. This is the largest sum ever raised as an outright gift in the history of the world. Only two states, Pennsylvania and Minnesota, failed to exceed their quotas, and it is believed that these states will be "over the top" when returns from Philadelphia and Minneapolis are in. Philadelphia, a "war chest" city, has not yet made an appropriation to the fund, while Minneapolis postponed its drive until next month.

CHRISTMAS PRESENTS FOR HOOD BOYS IN SERVICE.

The War Relief Club of the Hood Rubber Co., Watertown, Massachusetts, has practically decided to send to Hood boys in service overseas a check for 20 francs (\$4) with a Christmas folder, a Christmas card and Christmas letter. The boys can then buy what they need most. Hood boys in service in America will receive Christmas boxes costing \$4 to \$5 each. They will contain smoking materials, candy and a comfort bag of cretonne 12 by 14 inches in which will be found one pair of socks, two handkerchiefs, shoe strings, safety pins, pocket comb, safety razor, mirror, soap, pad paper, envelopes, pencils, knife, pipe, puzzle or toy, and a small towel. Two knitting machines have been installed for producing the 600 pairs of socks needed.

TO SERVE GOODYEARITES IN FRANCE.

The Goodyear Tire & Rubber Co., Akron, has opened an information bureau at 17 rue Saint Florentine, Paris, for the benefit of Goodyearites in service over there. Four rooms are occupied, one of which is a general reading and lounging room, with writing materials, magazines, newspapers, etc. An attempt will be made to keep a card index file of all Goodyear men in France.

SERVICE NOTES AND PERSONALS.

Robert L. Baird, son of Robert B. Baird and vice-president of the Rubber Trading Co., 9-15 Murray street, New York City, became a member of K Company, 23d Regiment, National Guard, in February, 1918. On October 2, 1918, he enlisted in the Officers' Training Camp, Field Artillery, Camp Zachary Taylor, Louisville, Kentucky, as a member of the 27th Training Camp. He is 29 years of age and has been an officer of the Rubber Trading Co. since 1912. Mr. Baird will remain in the service until he receives his commission.

ROBERT L. BAIRD.

William Wadbrook, son of Elston E. Wadbrook, has received from Congressman Ramsey, of the Sixth Congressional District of New Jersey, nomination for the Naval Academy at Annapolis, Maryland, having been successful in the recent open examination, under Civil Service rules, of candidates to fill this vacancy. Mr. Wadbrook attained the very high percentage of 94.80.

Captain Arthur H. Leavitt, a former employe of The B. F. Goodrich Co., Akron, Ohio, whose portrait appeared in our issue of September 1, 1918, was promoted early in October to the rank of major. He is with the Motor Transport Corps and returned from France shortly before receiving his promotion. Due to the recent signing of the armistice with Germany, Major Leavitt is now in Washington awaiting orders, although he had previously expected to return to France early in November.

W. H. Lacey, manager of the Hartford, Connecticut, branch of the Sterling Tire Corp., Rutherford, New Jersey, has been appointed a first lieutenant of the Motor Transport Division and is stationed at Raritan Arsenal, Metuchen, New Jersey, in the Ordnance Department.

William E. Housel, manager of the Rochester, New York, branch of the Sterling Tire Corp., Rutherford, New Jersey, has been appointed by the War Department a first lieutenant of engineers, stationed at Camp Humphreys, Virginia.

Captain Charles E. Speaks, who was formerly manager of motorcycle and, later, of truck-tire sales for the Firestone Tire & Rubber Co., Akron, Ohio, has recently been promoted to the rank of major in the Quartermaster's Department. He has had a long experience in the automobile and rubber-tire trade and will be a valuable man to the Government. Major Speaks is now in France, assisting in the rehabilitation of that devastated country.

Private Harvey Stickles, Headquarters Company, 166th Infantry, in France, for three years an employe of the Goodyear Tire & Rubber Co., Akron, Ohio, is one of the few Americans to receive the Distinguished Service Cross. During a bombardment he successfully repaired telephone lines connecting battalion with regimental posts, sticking to his work when others failed and narrowly escaping injury.

RUBBER MEN RETURNED FROM SERVICE.

Sergeant Walter Bardon, from October, 1914, until recently of the 1st Canadian Field Army, is now an inspector in the vulcanizing department of the Hood Rubber Co., Watertown, Massachusetts. Sergeant Bardon was presented a medal for distinguished service and honorably discharged as the result of a wound during the battle of Vimy Ridge.

S. A. Morrill, formerly Southern representative of the Davol Rubber Co., has been given an honorable discharge from the Army and has resumed work with the company. He is now located with the factory and home office in Providence, Rhode Island.

LETTERS FROM THE FRONT

MARTYRS TO THE CAUSE OF LIBERTY.

HELPED TO BREAK THE HINDENBURG LINE.

Lieutenant Michael F. Cassidy, formerly with the United States Tire Co., New York City, describes the death of his brother, Lieutenant James H. Cassidy, both being sons of John J. Cassidy, manager of the United States Rubber Co., Detroit branch.

FRANCE, November 9, 1918.

DEAR FATHER:

No doubt long before you receive this, you will have been notified by the War Department of Jim's death. Know you are anxious for the details and will try and give them to you.

Our company went over the top Sunday morning, September 29th, at 5:50 a. m. We were in what is known as the first wave. Met terrible opposition, and had to fight for every inch. I was with Jim all the way until he was hit. We had been going about an hour. He turned to me before he fell, and said: "They've got me; good-bye, Mike." I picked him up and as we were under very heavy machine-gun fire, got him into a German trench, which we had just cleared. He was still alive. I cut his equipment off, and he tried to talk, but could not—died in a minute or two. He suffered absolutely no pain and died in my arms.

I saw all Jim did that terrible morning—he knew no fear. He sure was one brave kid—never hesitated, where some others did.

He was afraid of nothing, and you have the honor of being the father of a hero. We had all been to Mass and Holy Communion the day before we went over, and of course Jim is in heaven now. Thank God he did not suffer a lot, as some of the other boys did.

I was buried shortly afterwards by a shell which burst near me and knocked me cold. It left small pieces of shrapnel in my back and both hands. I was taken to a base hospital and have been transferred here to a convalescent camp, and hope to be all right in a little while. I never can forget the terrible sights I saw that morning, until I was knocked cold, but of all the brave things done, none could touch what Jim did, always in front—he was the first man I saw who crossed the German trenches. Hero is a modest name for him.

Don't worry about me and write when you get a chance.
MIKE.

William Pierce, Jr., who before entering the service was employed in the factory of the National India Rubber Co., Bristol, Rhode Island, is reported missing in action since September 26. He was drafted last May, going to Camp Upton, and a few months later went overseas.

LIEUTENANT JAMES H. CASSIDY, formerly with the shipping department of the United States Rubber Co., New York City, and son of John J. Cassidy, manager of the United States Rubber Co., Detroit branch, was killed in France September 29. His brother, Lieutenant Michael F. Cassidy, was seriously wounded in the same battle, while breaking the Hindenburg line.

Up to November 14 their father had received no word from the War Department of either casualty. Several newspapers printed a report of the death of Michael at a base hospital subsequent to the date of his last letter to his father. We all trust that this report is in error and that he will soon be home with our other gallant veterans.

Three more gold stars have been added to the service flag of The B. F. Goodrich Co., Akron, Ohio. N. W. Pancoast and Thomas Welker, both of whom were formerly employed in Department 50, were killed in action in the Argonne Forest region in France during September. Welker was one of Akron's football stars and Pancoast at one time won the Goodrich baseball championship through his pitching, besides being prominent in basket-ball and other sports. Albert E. Witzler, formerly in Department 41-B, has been reported killed in action also.

The honor roll of The Goodyear Tire & Rubber Co., Akron, Ohio, now has forty-two gold stars, the six last added representing Privates Chauncey W. Barr, Floyd D. Beveridge and Bruce C. Fultz, the last of whom had been in the employ of the Goodyear company for nine years prior to his enlistment, and Privates Earl Custer, Robert Daley and Leslie Pitkin. Custer was killed in the Argonne Forest drive and Pitkin near Sedan.

Frank Martin Backes, a member of the Sanitary Detachment, Medical Corps of the 113th Infantry, has been reported killed in action. Backes was for a long time employed as a tire maker by the Essex Rubber Co., Trenton, New Jersey.

P. Frankenstein & Sons, Limited, waterproof manufacturers, of Newton Heath, Manchester, has lost its youngest director in the war, Second Lieutenant C. J. Frankenstein, son of Harry Frankenstein, having been killed in action in France.

Carl H. Drechsel, who was employed in the shipping department of the Alice Mill of the Woonsocket Rubber Co. at the time of his enlistment, is reported as missing in action since September 30, although a letter written by a Red Cross nurse dated October 11, states that he had been slightly wounded and was in a base hospital.

LIEUT. MICHAEL F. CASSIDY.

LIEUT. JAMES H. CASSIDY.

Why the Red Cross Needs Hundreds of Millions.

THE Army and Navy represent the will of the American people; the Red Cross represents the American heart. What the Red Cross has already accomplished in Europe will go down in world history to the everlasting credit of America, but what is being done out of sympathy for suffering humanity becomes insignificant in comparison with what duty calls upon us to perform for our own men and comrades in arms.

The American Red Cross has been a vital factor in winning the war. Its mission is primarily to alleviate suffering and restore health and strength to the sick and wounded at the front, but the present situation is so extraordinary that a great amount

of privation and trench warfare, must be checked to protect our armies. Humanitarian assistance of this character to hearten and strengthen the afflicted peoples of Europe will go far toward establishing law, order and stable government which pave the way for permanent peace.

Public interest in the rehabilitation of men disabled in battle has reached a high point. No longer will the responsibility of the army, the Government, or of industry cease by merely pensioning a man. He must and will be refitted to take perhaps even a higher place in the community than he occupied before his injury. A better education will be provided to offset the physical handicap, and it is the intention of the Government not only to pension every disabled soldier, but to teach him a trade whereby he can support himself adequately—if possible, a trade or employment in which his former experience will count. The Government will not discharge from the Army or Navy any crippled man until he has learned to be self-supporting.

A definite program has not yet been developed, but the Red Cross Institute for Crippled Men in New York City has taken the initiative in experimental vocational training and has demonstrated how the problem can be worked out. Men who have lost their legs are being taught the manufacture of artificial limbs, oxyacetylene welding, motion picture operating, mechanical drafting, printing and jewelry work, while those who have lost an arm are being supplied with new inventions which enable them to engage in a great variety of work.

It is to maintain the foregoing and many other forms of service to our fighting men and to their families through home service that the American Red Cross will conduct a Christmas roll call during the week of December 16 to 23. What finer message could be cabled to our boys on Christmas Eve than that virtually the entire American people have enrolled in the Red Cross. Such a message also would mean a wonderful inspiration to the civilian populations of Europe because it would show that the American people are no less responsive to the needs of their

(C) Committee on Public Information.

THE RED CROSS IN NO MAN'S LAND.

of other civilian relief work, at home as well as abroad, must be undertaken on a scale greater than the world has ever seen. This work presents to the whole people an opportunity and an obligation for sacrifice and service which every patriotic man, woman and child will gladly seize and generously fulfill. The cessation of hostilities will not diminish but rather increase the activities of the Red Cross, whose aid will be of vital moment in the great work of rehabilitation and reconstruction so urgently necessary in all the European countries.

The boys in our Army and Navy, 3,000 miles from home in a country partly devastated and sorely afflicted, must be assured of adequate medical attention and every possible comfort in the hour of need. Not only must doctors, nurses, ambulances, hospitals, medicines and vast quantities of supplies be provided, but a still broader humanitarian service must be undertaken. As long as it is necessary for our armies to remain overseas the Red Cross canteen service must be maintained in hundreds of hospitals, camps, railroad junction points and cities where the men go on leave. In these canteens hot drinks, sandwiches and tobacco are served and opportunities to bathe, sleep, read, play games or chat with the women workers are provided, all of which mean much to our boys and are regarded by army officers as of inestimable value in maintaining the morale of the men. Music and entertainments are also being abundantly provided in order to vanquish those dangerous foes, homesickness and temptation. Unlike the soldiers of England and France, our men cannot return to their firesides during short periods of relief from trench duty, and the Red Cross must often become the foster-parent of their dependent families.

Thousands of towns and villages have been destroyed in the various war zones. Millions of men, women and children are homeless and suffering for the barest necessities of life. They need clothing, agricultural implements, domestic animals, seeds, fertilizers, tools, bedding and stoves, which can be provided with Red Cross funds and distributed through Red Cross agencies. The spread of tuberculosis, now prevalent as a result

THE RED CROSS CANTEN IS A POPULAR SPOT WITH OUR BOYS.

fellow men in peace than in war. All anybody needs to answer to the Red Cross Christmas roll call is a heart and a dollar, but many larger contributions are needed.

The Red Cross is the most deserving charity of the times and merits every material assistance, active cooperation and constructive suggestion that individual or corporate beneficence can devise. Good use can be made of as much money as can be raised.

Activities of the War Service Committee of the Rubber Industry.

REGARDING ESSENTIAL RUBBER GOODS NOT LISTED.

ON October 29, 1918, the following notice was sent out by the War Service Committee.

To all rubber manufacturers:

Under date of October 11 all manufacturers were advised by telegram that the War Industries Board at our suggestion had ruled that pending decisions on application for classification of rubber articles as listed in issue No. 1 of "Regulations Governing the Production of Rubber Products," articles of unquestioned essentiality not listed might be produced to November 1 for current requirements.

The War Industries Board now advises that this ruling has been extended to November 11. After that date regulations published in issue No. 2 will govern production.

These regulations appeared in our issue for November 1, 1918.

REPLACEMENT OF RUBBER ON DIRECT GOVERNMENT CONTRACTS.

The War Service Committee notified all rubber manufacturers on November 4 that when executing the manufacturer's report to the Bureau of Imports, War Trade Board, requesting replacement of rubber used on direct government contracts, the report should state amount in pounds, dry weight, of crude rubber consumed.

W. S. C. QUESTIONNAIRE NO. 25.

At the request of the War Industries Board, the War Service Committee, on November 7, advised manufacturers that the naphtha situation was most serious. The Board had practically decided to limit the production of naphtha to aviation gasoline for government uses only and to motor spirits. No drastic action will be taken, however, until the requirements of the industry are known. To that end W. S. C. Questionnaire No. 25 requests a report from manufacturers on the grade and gallons of naphtha consumed from January 1 to November 1, 1918; estimated consumption for November and December, 1918, and gallons necessary to complete present government contracts. Manufacturers of tires, tire sundries, mechanical goods, footwear, insulated wire, insulating compounds, medicinal and surgical goods, waterproof cloth, waterproof clothing, hand-rubber goods, gas defense products, aircraft material and rubber cement, are requested to give their monthly production of government and other essential work; monthly production of government and other essential work if motor spirit only was available; monthly production of government and other essential work if only 68-70-degree and below was obtainable.

LETTER RELATING TO RUBBER PRODUCTS REGULATIONS.

November 9, 1918.

To the rubber industry:

Acting under the instructions of the War Industries Board the rubber industry is advised that until otherwise instructed they must operate in conformity with Issue No. 2 of "Regulations Governing the Production of Rubber Products," dated November 1, 1918, except that the production of all articles not listed in issue No. 2 and all articles on which rulings have been asked is permitted in such quantities as are required to meet the demands of the current trade.

Any rulings made since the publication of Issue No. 2 are hereby suspended. The requiring of pledges from customers is still held in abeyance in conformity with our letter of October 26.

WAR SERVICE COMMITTEE.

COMMITTEE ADVISES OBSERVANCE OF RESTRICTION RULES.

November 9, 1918.

To the rubber industry:

Acting under the instructions of the War Industries Board, the rubber industry is advised that until otherwise instructed no manufacturer should assume that because of an armistice being

signed the industry will be permitted to operate without restrictions. *This is not so.*

The conditions incident to making peace are such that in all probability a careful control and restriction of imports and consumption of raw materials and production of finished goods must continue for a number of months. Therefore it is important that each manufacturer shall conduct his business with such care as will insure complete cooperation with the War Trade Board, Shipping Board, War Industries Board and all other government departments.

WAR SERVICE COMMITTEE.

W. S. C. QUESTIONNAIRE NO. 25 WITHDRAWN.

NOVEMBER 18, 1918.

To all rubber manufacturers:

The Rubber Section of the War Industries Board has informed us that due to changed conditions, it will not be necessary for manufacturers who have not already answered Questionnaire No. 25 relating to naphtha consumption, to do so.

We wish to impress on manufacturers, however, that it will be necessary for them to answer all of the other questionnaires, and trust that they will send their answers in to us at their earliest convenience.

This is especially important to the rubber industry as these figures may form strong arguments for obtaining relief from present restrictions.

WAR SERVICE COMMITTEE.

REGULATIONS GOVERNING PRODUCTION OF RUBBER ARTICLES WITHDRAWN.

The following telegram dated New York, November 19, 1918, was received on November 20:

The War Industries Board instructs us to announce that all restrictions curtailing production of rubber articles in accordance with Issue No. 2, Regulations Governing Production of Rubber Articles, dated November first are withdrawn. This ruling permits the production without restriction of all articles listed in classes two and three; also articles not listed except automobile casings and tubes under six inches, on which we are advised Rubber Section has sent tire manufacturers revised production schedule for the remainder of this quarter.

WAR SERVICE COMMITTEE.

RUBBER SECTION OFFICE NOW IN WASHINGTON.

The Rubber Section of the War Industries Board is now located in the War Industries Annex building, Washington, D. C., to which all communications should be addressed.

ACTIVITIES OF THE RUBBER ASSOCIATION.

SINGAPORE GOVERNMENT PRESCRIBES BALED RUBBER.

THE following letter, dated November 4, 1918, was sent to rubber importers and manufacturers by the Committee on Rubber and Kindred Products:

The following cable has just been received from the Overseas Committee of the Rubber Association of America:

Singapore Government regulations pressing come into force November 15, sheets 220 pounds, crepe 165 pounds, five cubic feet.

From this it will be noted that the Singapore Government has taken the initiative in making the closer form of packing (announcement of which was brought to your attention in our letter of March 23) a compulsory regulation.

We construe the weights mentioned as being the minimum, which after November 15 must be packed in the unit of five cubic feet (the usual size of a rubber package).

ANNUAL MEETING AND BANQUET.

The nineteenth annual meeting and banquet of The Rubber Association of America, Inc., will be held January 20, 1919, at the Waldorf-Astoria, New York City.

This will probably be one of the most important meetings ever known in the history of the trade, and a large attendance is confidently expected.

CONSERVATION OF TRANSPORTATION.

In a letter dated November 9, the Traffic Committee directed attention of firm members to the following bulletin issued by the chairman of the War Industries Board and relating to the conservation of transportation facilities:

To all merchants and manufacturers in the United States:

Under present conditions it is obvious that the transportation facilities of the country must be conserved in every practical way in order that the movement of troops, supplies, munitions and shipbuilding materials may be unhampered. The situation demands that all needless and wasteful use of shipping space be eliminated.

It appears that one of the burdens which can and should be removed is the unnecessary return of merchandise from merchants to wholesalers and manufacturers. This double transportation of goods to and from the purchaser meets no essential need but results in waste. To remedy this situation, therefore, retailers, wholesalers and manufacturers in every industry and trade are earnestly requested to cooperate with each other for the elimination of all unjustifiable returns of merchandise.

This request is not intended to interfere with the return of merchandise when there has been an error on the part of the seller as to price, style or quality, misinterpretation of order, unauthorized substitution, or when merchandise is inferior or not up to sample. When goods are delivered "as bought," however, they should not be returned to the seller. If merchandise is to be returned because of substitution or error of any kind, notice should be given by the purchaser, within ten days after the receipt of the goods, that return is intended. Ample time should, of course, be allowed for explanation or proffered adjustment.

Salesmen should make "definite" sales only. In their travels, furthermore, they can be of particular assistance by enlisting the cooperation of their customers for careful selection and purchase of merchandise so that returns will be unnecessary.

Whole-hearted compliance with this request in the spirit of husbanding our resources and eliminating waste of transportation, materials and labor will be a substantial contribution by the merchants and manufacturers of the country to our general welfare and the success of the war program.

CONSERVATION DIVISION, WAR INDUSTRIES BOARD.

INCREASE IN TONNAGE OF RUBBER LICENSED.

The Committee on Rubber and Kindred Products sent the following letter, dated November 21, to rubber importers and manufacturers:

The amount of rubber that may be licensed for the present quarter of October-December has been increased from 25,000 tons to 32,500 tons, as per advice received from the War Trade Board, copy of which follows:

November 20, 1918.

Rubber Association of America, Inc.:

Supplementing our letter dated September 23, the quantity of rubber for which import licenses may be issued by the War Trade Board during the October-December period has been increased from 25,000 to 32,500 tons. The additional 7,500 tons will be allotted to manufacturers in Class B, under subdivisions 1, 2 and 3 on basis of an amount equal to 75 per cent of their previous allocation for this period; and to manufacturers in Class C, on basis of an amount equal to 33 1/3 per cent of their previous allocation for this period; but only to manufacturers in either class who have furnished information as to production and consumption called for in questionnaires to date and who have conformed to regulations governing production since August 1, 1918, as announced by War Trade and War Industries Boards.

Provision will also be made for allocation to manufacturers who were not in production previous to August 1, 1918, and they will receive allocation to conform with production as authorized by the War Industries Board.

This additional allocation to be granted may be used for importation of crude rubber from any source.

WAR TRADE BOARD.

The Bureau of Imports advise they will issue allotments in accordance to manufacturers, for this additional 7,500 tons, which may be used for the importation of crude rubber from any source.

We are directed also to remind importers and manufacturers of the statement in letter of September 23 to the effect that

manufacturers must utilize the full amount of their allocations before any allotment will be made them in succeeding periods.

(Editor's Note:—Details of crude rubber allocation for the October-December period were published on pages 13-14, in THE INDIA RUBBER WORLD, October 1, 1918.)

CLOTHING DIVISION MEETING.

The Clothing Division of the War Service Committee of the Rubber Industry held a meeting at the Yale Club, New York City, November 20, at which all the manufacturers in that division were represented. N. Lincoln Greene, the chairman of the committee, presided.

The meeting was held to consider the future of the organization, as the War Industries Board, of which this body was a part, would cease with the termination of the war. As explained by George B. Hodgman, of the Central Committee, a convention of the rubber trade will probably be held in New York City about the middle of December, at which it would be decided to continue permanently, following the plans already started by each committee, even though the Central Committee and the War Service Committee were dissolved.

It was therefore voted that a committee be appointed to make recommendations as to the advisability of forming a permanent organization, the chairman appointing thereon S. T. Hodgman, of the Hodgman Rubber Co., and W. H. Yule, of The B. F. Goodrich Rubber Co.

It was voted to continue the Manufacturers' Chart of Calendered Rubber Clothing, with some revisions made that day, up to and including June 1, 1919, with the understanding that a meeting be held 30 days prior to that date, for a readjustment, if necessary. All restrictions on double and single texture rubberized clothing was removed, but each manufacturer is to make special effort, along the lines of conservation, to restrict styles as much as possible. No restrictions, however, are to be enforced on styles in either class for export.

It was decided that the committee as a whole should apply for membership in and reorganize under The Rubber Association of America.

CRUDE RUBBER STOCKS OF SEPTEMBER 30, 1918.

The following letter was sent to the rubber trade on November 19:

By direction of the War Trade Board, statistics of crude rubber stocks as of September 30, 1918, were collected from the rubber trade in the United States by The Rubber Association of America, as per the questionnaire sent out at the time to both importers and manufacturers. We are now authorized by the War Trade Board to make these figures public.

Manufacturers reported the following tonnage on hand September 30, 1918:

	In Stock.	In Transit.	Afloat.	Totals.
Crude rubber	34,934.0	15,301.7	1,420.5	51,656.2
Jelutong	1,956.8	54.6	2,011.4
Gutta percha	36.0	10.5	46.5
Balata	191.6	16.8	208.4
Gutta siak	758.2	52.2	810.4
Totals	37,876.6	15,435.8	1,420.5	54,732.9

Importers reported the following tonnage on hand September 30, 1918:

	In Stock.	In Transit.	Afloat.	Totals.
Crude rubber	7,425.2	5,487.8	8,983.6	21,896.6
Jelutong	256.0	144.0	400.0
Gutta percha	5.1	164.0	169.1
Balata	109.0	4.5	13.9	127.4
Gutta siak	31.5	21.0	52.5
Totals	7,826.8	5,657.3	9,161.5	22,645.6

The total tonnage for both manufacturers and importers is as follows:

	In Stores and In Stock.	In Transit and Afloat.	Totals.
Crude rubber	42,359.2	31,193.6	73,552.8
Jelutong	2,212.8	198.6	2,411.4
Gutta percha	41.1	174.5	215.6
Balata	300.6	35.2	335.8
Gutta siak	789.7	73.2	862.9
Totals	45,703.4	31,675.1	77,378.5

Broad American Maritime Policy Needed.

WITH its principal raw material coming from the tropics overseas in ships, and an increasing amount of its manufactured product being exported to foreign lands, the rubber industry, the fifth largest in America, realizes that the development of a broad and sound American maritime policy is of prime importance to the national welfare. Its interest in the fifth annual meeting of the National Foreign Trade Council, held at the Biltmore Hotel, New York City, November 8, requires no further explanation.

The National Foreign Trade Council is made up of representatives of every factor of foreign trade, industrial, agricultural, commercial, financial and transport. It represents every section of the country, and among those present at the annual meeting were men from the Pacific Coast, the South, the Middle West, and New England, as well as from New York City, the rubber industry being represented by E. H. Huxley, president of the United States Rubber Export Co.

A declaration against an economic warfare after the war, and a strong pronouncement in favor of the adoption of a national maritime policy that will permit the permanent retention and operation of the newly constructed American merchant fleet under the American flag were the distinguishing features of this meeting.

The chairman of the council is James A. Farrell, president of the United States Steel Corp. In his address presenting the report of the committee on merchant marine, of which P. A. S. Franklin, Robert Dollar and himself were the members, he discussed some of the problems facing this country as a result of the war and of the restoration of peace.

NO ECONOMIC WARFARE.

"The progress of the war," he said, "has been marked by much discussion of proposals for and conditions of a continuation of the contest by economic forces after the military struggle is ended. Our supreme duty is to see to it that the peace terms render impossible the continuance of conditions sought to be corrected or prevented by economic warfare. If the peace is satisfactory, there will be no need for economic warfare. If the peace is not satisfactory, economic warfare will be possible. It is for us then rather to devote our fullest effort now to insuring the enforcement of an adequate, just, and final peace. With such a peace we can go forward in confidence to meet and solve the numerous and intricate problems certain to arise from the complex and novel conditions naturally flowing from the cataclysm that has overwhelmed the world during these last four years."

NEW COMMERCIAL TREATIES.

Mr. Farrell referred to the importance of the negotiation of new commercial treaties which will be necessary promptly after the conclusion of peace, and declared that the first problem of reconstruction will be that of the merchant marine. He emphasized the importance of arriving promptly at an effective solution of this problem.

"We are building the ships," he said, "which will be the most effective agency in the permanent solution of the great after-war problem; always provided, however, that our nation adopts a definite maritime policy which will permit the permanent retention and operation of these vessels under the American Flag."

CONSTRUCTION PROGRAM SHOULD CONTINUE.

The report emphasized the importance of continuing the present accelerated construction program of the Shipping Board for a considerable time after the war in order to complete cargo and passenger-carrying ships aggregating about 14,000,000 gross

tons, which will not only restore the world's tonnage losses, but amply meet the needs of American foreign trade.

Discussing the essential factors in the furnishing and operation of ships—the cost of capital, the cost of construction and the cost of operation—the committee concluded that so far as costs of capital and of construction are concerned, the United States will not be disadvantageously situated after the war compared with other maritime nations.

COMPETENT CREWS ESSENTIAL.

The report then says:

"No one contends or believes that it is not desirable to have American vessels fully manned by competent crews and to have American seamen enjoy the best possible conditions of life and service, and receive in wages due and ample return for their labor. But it is perfectly obvious that provision of law which requires American vessels to maintain larger crews, and to pay them higher wages than is the case with foreign vessels, necessarily subject such American vessels to a disadvantage which renders it difficult if not impossible for them to continue in operation against the competition of foreign vessels which can operate at lesser cost."

DEFINITE MARITIME POLICY NEEDED.

Summing up the whole matter, the committee says, "The United States, then, will emerge from the war with a large merchant fleet and with the facilities for its renewal and expansion, but unless positive steps are taken in the very near future toward the formulation and adoption of a sound national maritime policy, it may be set down as absolutely certain that these newly constructed American vessels will not remain in operation under the American Flag and that the American merchant marine, rehabilitated with vast expenditure of capital and effort as a war emergency measure, will again be dissipated under the operation of inexorable economic laws.

PROFITABLE OPERATION MUST BE ASSURED.

"We cheer the acquisition of the new fleet and we applaud the energy of the Shipping Board and the tireless industry of the thousands of workmen in the mills and shipyards who have brought it into being; but our cheers will be idle and our enthusiasm and energy will have been wasted unless before the day arrives for the renewal of competition that is bound to follow the restoration of peace, we have formulated and adopted a policy based upon honest recognition of fundamental economic principles, which will enable us to meet that competition with our new American ships, under the American Flag, with honor and with profit to ourselves and without injustice or unfairness to our competitors. It is most important that the American should face his competitors under equal conditions. All that is needed is a fair field and no favor. As an incident of the international agreement and settlements soon to be worked out, the maritime nations should agree upon uniform regulations which will impose equal conditions and requirements upon all alike. Such an arrangement would insure that equality which will give every one a fair chance."

INTERNATIONAL AGREEMENT SOUGHT BY HURLEY.

It is understood that Edward N. Hurley, chairman of the Shipping Board, who sailed for Europe November 16, plans to seek an international agreement between the governments, shipping interests and labor organizations of the principal maritime powers for standardization of seamen's wages and working conditions. He will probably propose that the American laws and the agreements between the governments and the seamen's unions on these subjects be accepted as the standards and include that

the American Federation of Labor and the British Seamen's Union are prepared to support the proposal.

BRITISH vs. UNITED STATES SHIPPING.

Although there is no immediate prospect of a resumption of normal shipping activity great interest is being manifested in the coming competition for control of the world's carrying trade, an interest which has been considerably heightened by the sudden termination of the fighting. Great Britain and the United States are regarded as the chief competitors, but Great Britain has the advantage in the amount of tonnage owned, the trained men and experience, and the fact that she will be able to resume much of her pre-war shipping before the United States will be in a position to enter the field on a large scale.

American initiative will offset these disadvantages to a considerable degree, but the great handicap lies in bringing back our great armies overseas. The burden of feeding Europe, will, of course, fall heavily on both the British and American merchant marines, but the task of transporting returning troops and of supplying those that remain abroad is greater in the case of the United States. The expectation is that the transatlantic liners under the British flag may be called upon to perform the dual service of transporting food to England and bringing American troops home. But in the main, it is agreed that the American army will be brought over in American bottoms, many cargo vessels being converted for this purpose.

Chairman Hurley of the Shipping Board says: "Only a limited portion of the shipping which can be constructed by us in 1919 will be available for use in ordinary commercial channels." In contrast to this is the statement by the agent here of a British company operating a New York-South American service: "We are looking forward to the gradual return of our tonnage and we hope it will be soon."

Another point of the greatest importance is that Great Britain has definitely announced a policy of "hands off" as soon as conditions will permit, while the United States has so far not indicated its intentions further than that the Emergency Fleet Corporation will carry its shipbuilding program to completion. Bonar Law, Chancellor of the British Exchequer, has declared that the British government does not contemplate nationalization of shipping after the war and some government ships have already been offered for sale to private interests.

The British shipowner, it is felt, can look forward with greater confidence to the future. He will be first in the field and may easily gain a long lead. The United States must plan very carefully if this is to be prevented. Certainly, the day when restrictions on British shipping are removed, the bars must be let down by America also.

CONVENTION OF AMERICAN MANUFACTURERS' EXPORT ASSOCIATION.

THE ninth annual convention of the American Manufacturers' Export Association was held at the Waldorf-Astoria Hotel, New York City, on October 30 and 31, hundreds of delegates taking part in the proceedings. Among the members of the board of directors are the following: F. A. Seiberling, the Goodyear Tire & Rubber Co.; F. A. Taylor, S. S. White Dental Manufacturing Co.; E. M. Herr, Westinghouse Electric & Manufacturing Co. Rubber companies were to the fore at the convention. D. L. Brown, export advertising department, the Goodyear Tire & Rubber Co., Akron, Ohio, spoke on foreign advertising; Frank H. Taylor, president, S. S. White Dental Manufacturing Co., Philadelphia, dealt with the subject of the new type of foreign representative; J. F. Foyler, W. R. Grace & Co., New York City, read a paper on the export merchant; C. J. Warren, export manager, H. W. Johns-Manville Co., New York City, presided at the session at which sales organization abroad was discussed; F. B. Whitney, of the committee on commercial treaties and trade

marks, reviewed the history and present position of the treaty situation in a comprehensive manner; and M. A. Oudin, foreign manager, General Electric Co., Schenectady, New York, outlined what is needed in the development of foreign trade service.

THE GOVERNMENT'S PNEUMATIC TIRE TESTS.

Commencing December 1, the Government will purchase pneumatic tires on a specification basis. Space not being available for the work at the rubber laboratory of the Bureau of Standards, Washington, D. C., part of the laboratory at the University of Akron, Akron, Ohio, will be used for the chemical analyses necessary on specification work for all tires manufactured in the Akron district and west of Akron. The remainder will go to the Bureau of Standards, Washington, D. C. The necessary physical tests on the tires will be made by inspectors at the various plants and will be checked by results obtained in the physical rubber laboratory of the Bureau in Washington. The Akron branch will be in charge of S. W. Epstein, while Arnold H. Smith will direct the work at Washington. A photograph and personal sketch of Mr. Smith appeared in THE INDIA RUBBER WORLD May 1, 1918.

BARBECUE TEST ON SOLID TIRES.

The so-called barbecue test was devised to measure the adhesion between the tread rubber, and the hard-rubber layer of a solid truck tire. It formerly was required by the specifications for solid tires to be furnished to the United States Government. The details of the test are given below although recently it has

THE BARBECUE TEST ON A SOLID TIRE.

been discontinued by authority in government inspection. The equipment consists of a strong bench upon which is mounted a heavy vise. At the end of the bench opposite the vise is mounted a 1½-ton triplex chain-block. A 2,500-pound Chatillon dynamometer is used to register the pull. The tire is prepared for test by cutting the rubber back along the top of the tire channel far enough to permit a secure rope tie. The dynamometer is interposed in the line of pull between tire and chain-block, as shown in the illustration, and registers the strain required to separate the soft rubber from the hard.

BRAIDED CABLES FOR THE TROPICS.

British cable manufacturers who make cables with white, red and black braiding state that the first is chiefly for export to the tropics. It seems that for some reason, which has hitherto found no satisfactory explanation, rubber with white, or even black braiding, is less liable to deterioration in tropical climates than with red. Thus in India, practically no red braided cables are used.

Rubber in Airplane Construction.

By Edgar H. Wilson.

SOME of the most essential accessories for airplanes are made of rubber for the reason that they are affected neither by high altitudes nor by sea-level conditions, and, moreover, if the plane meets with a mishap, rubber parts are the last ruptured. Airplane parts that are now made of certain other materials could just as well be made of something different, but this is not so with parts made of rubber, the importance of which in the field of aerodynamics is being admitted to an increasing extent. The lives of aviators depend on the action of each part; a fact that must be borne in mind in the construction and manufacture of all parts and accessories.

TIRES AND TUBES.

Pneumatic fabric tires were the first rubber equipment to be used on airplanes. The original type has now been superseded by efficient cord casings with thin treads and completely exposed side walls. Weight and cross-section at this point must

be cut to the minimum, because it forms parasite head resistance. The inner tubes are of very light, yet strong construction, and are so encased that pinching is reduced to a minimum. The tubes are equipped with special valves which protrude through the rubber covering that surrounds the spokes of the wheel. The openings of these valves will fit both American and French air pumps by merely reversing the cap.

GRIP HANDLES AND GROMMETS.

Rubber grip handles used on all light fighting planes, are light and of efficient construction. Heavy day or night bombers use the "Dep" or wheel control, made of vulcanite or hard rubber. Grip handles are made in three types. One is used in connection with Liberty-motor-equipped planes and the other two in connection with the lighter rotary motors, where parts of the switch control are necessary in the end of the stick or "joy" control. Rubber grommets, or escutcheons, are used in many places for protecting wires passing through the cowl and to protect the tachometer and speedometer shaft. They are provided in various sizes, of round and oblong shape, and designed to hug the hole in which they are placed.

SPECIAL HOSE.

A special line of aircraft hose has also been developed. Air hose is not used to any extent, but hot oil and gasoline hose are utilized in many places in the construction of standard aviation motors. Performance must never fail or serious accidents will occur. The specifications for the hose used by the Government have been drawn up by the Signal Corps after competitive tests with various kinds of hose. Recently a molded and braided type has made its appearance, which has been found more efficient than the other types of hose. There has also been considerable improvement in radiator hose, which must be light and yet resist high temperatures for long periods.

RUBBER PADS, RADIATOR CAPS AND INSULATED WIRES.

Many rubber pads are used throughout an airplane between the axle and its bed, between the tail skid and the adjoining cross member, to reduce motor vibration. These have all proved their ability to assimilate punishment, and to save more important members from excessive wear. Hard-rubber radiator caps are of much the same construction as those used on automobiles; they are used on many types of airplanes. Insulated wires perform the same duty as on an automobile, except that they must be better protected and of greater efficiency.

RUBBER STREAM LININGS.

Rubber is a very efficient stream-lining material. On some types of machines the axles and spreader tubes running parallel to them are completely covered by a rubber tube which expands during the landing of a machine, and contracts as it leaves the ground, so that the head resistance of this member is at a minimum. Possibly the most efficient stream lining is accomplished

at the tail skid, where a rubber bib is attached so that the opening in the fuselage is closed to air currents while in flight and stones and foreign matter are kept out while taxiing across a field. The inner-plane wires have also been stream-lined, when they are parallel, by a specially constructed rubber

RUBBER AND A MODERN BIPLANE.

tube which encloses them. Wind-tunnel tests show that two wires thus covered offer less resistance to the air than single wire uncovered, which results in largely reducing head resistance, which means a considerable increase in the number of miles per hour, as well as a diminution in gasoline consumption. It also eliminates the harsh vibration peculiar to wires that are not stream-lined. There are also irregular rubber parts which cover control-surface regulators for changing the balance of the plane while flying and disposing of its load of bombs.

FUSelage-WIRE PROTECTORS.

Fuselage-wire protectors are an adaptation of the idea of the ball-and-socket fastener applied to a rubber washer. Both "ball" and "socket" have a groove across the flat surface, along which lies the fuselage wire. The little device is put at the exact point where the wires cross and the tension of the wires themselves holds it indefinitely in place, while at the same time it in turn holds the wires together, yet leaves them free to move with itself as the axis. It thus provides a solution for what was a serious problem—how to fasten the fuselage wires together flexibly and prevent them from wearing each other by friction, particularly when the planes struck the ground and the longerons straightened out, thereby changing the angles of the fuselage wires relatively to each other.

SHOCK ABSORBERS.

Many types of shock absorbers have been tried and found wanting, but the rubber cord is in favor at the present time. Originally, when rubber was first adopted, a series of rubber

rings was enclosed in a bridge on either side of the axle, but these were found cumbersome and heavy and presented too much parasite head resistance. Then came one of lighter rubber-cord construction that gives very good results; however, it is evident that the shock absorber is still in its infancy and opportunities for improvement are abundant. The life of the rubber cord, which is composed of many small strands of rubber covered by a braided cotton cover, is governed by the life of the cotton. When the covering breaks, the efficiency of the cord is at an end. The greatest reason why the rubber cord is used is because of the peculiar hysteresis curve that it gives. It has, moreover, great ability for absorbing shock in landing and taxing across a field. The old type of rubber ring has very little hysteresis except when the stock is of such a nature that it cannot come back, and consequently takes permanent set. Obviously, a unit of rubber that elongates when a load is applied, and returns promptly to its original length when the load is released, affords little shock-absorbing ability, because its action is equal in both directions. A new type of shock absorber recently developed is made of rubber with all the advantages of the cord, but with none of its disadvantages. In order to prolong the life of the rubber cord or rubber shock absorber in some of the lighter fighting planes, a protecting collar of rubber has been made to be inserted in such a way that the pinching action of the metal portion of the spool and bed is eliminated, so that the cord is free from punishment and its efficiency is impaired only by its own action.

RUBBER WASHERS, STRIPS AND COLLARS.

Because of the continuous vibration of airplanes, petrol tanks and all delicate parts are guarded to some extent with rubber, either in washer or strip form. Special designs of oil strips have been made for use in the head cowl of the rotary motors. These prevent the oil from spraying the face of the pilot and not only add greatly to his comfort, but to his safety as well. Then, too, there are rubber radiator collars, used when the shaft of the motor with the propeller fastened on the end protrudes through the radiator. This rubber protects the delicate portion of the housing so that it will not be cut through by the harsher member under constant vibration.

TANK COVERS, MATTING AND TUBING.

Interesting tests have also been made on a gasoline tank cover so constructed that the inner stock of the cover kept under pressure, and when penetrated by bullets the holes are immediately closed, thereby retaining the fuel and permitting the aviator to reach his own line with safety. Rubber matting is being used, principally the pyramid type, in place of aluminum. These molded pieces of matting are used on the pedal bar, for foot control in the foot-holes and on the floors of the large bombers.

Tubing as well as hose is essential. Light tubing is used for conveying gasoline and oil under low pressure, and acid tubing is also required. There are also numerous pieces of rubber tubing that are compounded to endure long periods of oxidation. These are placed in the pipe lines at critical points where metal tubing cannot be used to advantage.

OXYGEN HELMET.

The pilots at some of the aviation fields have recently become interested in rubber clothing providing warmth for themselves while in flight. A most important equipment of an army aviator is the oxygen mask for high altitudes. Without this helmet the cruising radius of a pilot would be confined to what his own physique would stand, but with the helmet, the cruising radius is only limited by the capacity of the machine which he flies. The apparatus consists of a helmet, similar to the present gas helmet used by the Army, with the exception that pure oxygen is breathed instead of air passing through purifying substances.

Formerly aircraft engineers were skeptical about the mechanical efficiency of rubber, but during the past year such developments have taken place that they are beginning to recognize the

advantages of the use of rubber and are awaiting with interest the introduction of other rubber parts and the refinement of those now in use.

UNITED STATES ARMY SPECIFICATIONS FOR RUBBER BLANKETS.

MATERIALS.

THE body of the blanket to be of gray sheeting, best quality, at least 36 inches wide, weighing not less than three and ninety one-hundredths (3-90/100) ounces to the linear yard, 35 inches wide; counting not fewer than 56 threads and not more than 66 threads to the inch in both warp and filling, and having a tensile strength of not less than 56 pounds to the inch in the width in both warp and filling.

Blankets to be thoroughly and uniformly coated with a high-grade black rubber compound containing not less than 75 per cent (by volume) best grade fine Para or plantation *Hevea* rubber, the sulphur content not to exceed 5 per cent by weight of the total rubber content. The surface rubber to be calendared and not spread upon sheeting. Each blanket to be vulcanized after being manufactured.

SIZE AND DESCRIPTION.

To be 83½ inches long and 71½ inches wide, all four edges to be turned in with a 1¼-inch hem, securely cemented, making the complete blanket 80 inches by 68 inches. Where edges of material are joined to form proper width, the joined edges must be turned under and securely cemented as in the standard, the tensile strength of the joint to be at least 40 pounds per inch of width. Blanket to have one No. 3 brass grommet in each corner, four on each end, and five on each side, one inch from edge of blanket, placed equal distances apart, about 13 inches, as shown in standard sample. Completed blanket to weigh not more than 6 pounds 4 ounces and not less than 5 pounds 12 ounces.

MARKING.

Each blanket to be stamped or stenciled on under surface with the following, fast-color black ink being used: near center: "Med. Dept. U. S. A." (one-inch black letters); in one corner: (name and location of contractor and date of contract).

FOLDING AND PACKING.

Five blankets will be folded to form a bundle about 15 by 36 inches. Seven of these bundles (35 blankets) will be packed in boxes strongly made of ¾-inch (finished) material, strapped for export shipment (specifications for export packing boxes furnished on request). Each box to be marked on its end with the contents, name of contractor and date of the contract.

WORKMANSHIP AND FINISH.

Workmanship and finish of blankets to be first-class in every respect, equal to and like standard sample at Field Medical Supply Depot, United States Army, 21 M street, Northeast, Washington, D. C.

WASTE RECLAMATION COUNCIL MEETING.

A meeting of the Waste Reclamation Council was held Thursday, November 21, at Washington, D. C., when the importance of waste materials during the war and in the after-war program was discussed.

Among the speakers were former President William H. Taft and Hugh Frayne, chairman of the Labor Division of the War Industries Board. Louis Birkenstein, Chief of Salvage of the Department of Reclamation and Conservation of the War Department, who represented the National Association of Waste Material Dealers, pledged the association's cooperation in carrying out the Government's plan for collecting and marketing waste materials.

"Rubber Machinery," by Henry C. Pearson, is filled with valuable information for rubber manufacturers. Price, \$6.

U. S. NAVY DEPARTMENT SPECIFICATIONS FOR INSPECTION OF RUBBER MATERIAL.

GENERAL SPECIFICATIONS.

1. "General Specifications for Inspection of Material," issued by the Navy Department, in effect at date of opening of bids, shall form part of these specifications.

TEMPERATURE OF TESTING ROOM.

2. All tests of the rubber parts shall be made in a room, the temperature of which is not below 65 degrees F., nor above 90 degrees F. No tests shall be made until 48 hours after vulcanization.

APPARATUS FOR TESTS.

3. A standard testing table suitable for the purpose shall be used.

TESTS OF ADHESION OF RUBBER PARTS TO COTTON OR FABRIC PARTS.

PREPARATION OF TEST PIECE.

4. In making the test, a section of the article shall be cut as follows:

(a) In testing hose the section shall be cut transversely, unless the diameter of the hose is too small to be practical for this test, in which case it shall be cut longitudinally.

(b) When testing belting, packing, or gasket material, it may be cut in any direction.

(c) When testing rubber-lined cotton hose the test piece shall be prepared by cutting directly through the section, so as to lay out upon the table a piece measuring the full length of the circumference of the hose and 2 inches in width. On this piece two parallel cuts $\frac{1}{2}$ inches apart shall be made by cutting through the lining only and not injuring the cotton cover. This strip shall be started at one end to the extent of about $\frac{1}{4}$ inches. The cotton cover only shall be fastened in the clamps.

(d) When testing a fabric-plied hose the section shall be one inch in width. The piece shall be separated until the part next to the rubber cover shall be loosened. The section shall then be placed on a mandrel whose diameter is the same as that of the inside of the hose to be tested.

(e) When testing packing the piece shall be prepared as in the case of rubber-lined cotton hose, unless the thickness of rubber is greater than $\frac{1}{4}$ inch, in which case the piece shall be prepared in such a way that the rubber part may be clamped at the top and held immovable while the weight, as described below, is clamped to the fabric.

(f) When testing belting the test strip shall consist of two plies of fabric only, one ply being held in the stationary grip, with weight suspended freely from the other ply.

(g) Square Tuck's packing shall be tested in the same manner as is specified for testing the friction between the plies of a belt.

(h) The friction in round Tuck's packing shall be tested by the same method as is used in fabric-plied hose, the core being drilled out to permit the insertion of a mandrel. Whenever the core is $\frac{3}{16}$ inch or less in diameter it shall be tested in its original shape. When it is over $\frac{3}{16}$ inch in diameter a piece six inches long shall be separated from the fabric and cut and buffed on four opposite sides to form a square section $\frac{1}{4}$ by $\frac{1}{4}$ inch in the center of the test piece. The $\frac{1}{4}$ -inch square shall be at least one inch in length.

(i) In testing the friction of belting the load should be applied at right angles to the plane of separation, or the test strip should consist of only two plies of fabric, one ply being held in the stationary grip with the weight suspended freely from the other ply. By this means the effect of the thickness of the belt may be eliminated.

PERFORMANCE OF TESTS.

5. Having thus fastened the test piece, the clamp ring shall be slipped upon the mandrel, or, in the case of fabric-plied hose,

the test piece shall be slipped upon the mandrel. The free-moving clamp shall be tightly fastened to the free end and the weight supported upon a movable table hooked over the hook in the clamp. The weight and the clamp together shall be exactly equal to the weight called for in the specifications.

The weight then supported by the movable table of the testing machine shall be lowered until the clamp and free end of the hose are just taut. An indelible pencil mark shall be placed upon the separating layers of the test piece, and by quickly loosening the thumb screw supporting the table it shall be allowed to fall, leaving the weight freely suspended. In every case this shall be done without a jerk. The time shall be read at the moment of freeing the weight and at the moment of re-marking. The weight shall be allowed to act upon the test piece for ten minutes, at the end of which time an indelible pencil mark shall be placed again upon the separating layers of the test piece. The movable table shall then be brought up to hold the weight, the test piece removed and laid upon the table, and the distance between the pencil marks shall be measured by means of a certified rule accurately graduated in decimals of an inch. The distance between the marks shall be recorded as the number of inches of separation in ten minutes, from which shall be computed the rate in inches per minute.

TESTS OF RUBBER PARTS.

PREPARATION OF TEST PIECE.

6. (a) For hose, a section one inch in width shall be cut. For belting, packing, and sheet gaskets a piece one inch in width and six inches in length shall be cut in any direction. The rubber parts shall be carefully separated from the fabric of this piece, using benzine in small amount if necessary. The benzine used in this case shall always be 76 degrees Baumé, free from oil.

(b) In case of articles to be tested, such as washers, ferules, and molded gaskets, which are of such peculiar shape that the above methods do not apply, small sample pieces shall be sent with each delivery. These sample pieces shall be eight inches in length, $\frac{1}{2}$ inches in width, and $\frac{1}{8}$ inch in thickness, unless otherwise specified. These sample pieces shall be guaranteed by the manufacturer to represent truly the average composition and cure of the article delivered. Test pieces shall be cut from these samples as described below.

(c) From these one-inch sections, or from sample pieces thus prepared, a test piece shall be cut by a die. The dimensions of the test piece shall be indicated in each specification. It is the intention to have the cross-section area at the constricted part approximately $\frac{1}{32}$ square inch. The backing or cloth impression shall be removed from the test piece by buffing for determining the cross-section area. The test specimen shall be buffed on a machine such as is made by the Emerson Machine Co., of Boston, or its equivalent.

(d) No test shall be performed until the piece has been allowed to stand for one hour after removal from the article, if it has in any way been in contact with benzine.

TESTING MACHINE.

7. (a) The jaws shall tighten automatically and exert a pressure proportionate to the applied tension. The rate of speed of separation of the jaws shall be uniformly 20 inches per minute. The jaw shall exert a uniform pressure across the width of the test piece, regardless of any variation in the thickness of the rubber.

(b) The test machine shall be suitable to carry out the necessary tests, and shall be standardized in accordance with the latest approved designs so far as practicable.

MAKING THE MEASUREMENTS.

8. (a) TAKING OF TIME.—All measurements of time shall be taken by means of a stop watch. The fundamental methods of testing are so made throughout the entire rubber specifications that the following procedure shall be uniform: After

placing any test piece in the machine ready for stretching, the piece shall be drawn just taut and the stop watch started at the instant of the beginning of the stretch. The piece shall then be held for ten minutes at a specified distance, and the time shall be again noted at the moment the piece is released. This moment is simultaneously the beginning of the period of rest. The measurement is then to be taken at the instant of expiration of the second 10 minutes.

(2) MEASUREMENT OF ELONGATION.—Marks two inches apart shall be placed on the test piece by means of a marker. These marks shall be at right angles to the direction of pull of the piece in the machine. Great care shall be taken: (1) That the marks are not too wide, and (2) that at the time of marking, the piece shall have been lying for a sufficiently long time to be completely at rest on a wooden table which has been at the temperature of the room mentioned in paragraph 2 herein. The marks shall be placed on the smooth side; that is, in no case on the side which is corrugated, due to its impression taken from the fabric.

After clamping the test piece in the jaws of the machine the movable jaw shall be so adjusted with the pointer reading zero on the scale that the test piece is just taut, but not under tension. The operator shall throw on the power to start the screw and, when ready, throw in the engaging lever to start the jaws. He shall keep the elongation scale pointers opposite the outside edges of the marks on the piece. To stop the motion at the desired elongation or upon the break of the piece, the jaws shall be disengaged from the screw.

The accuracy with which the elongation measurements are made will depend upon the accuracy with which the operator keeps the two pointers opposite the outside edge of the marks on the test piece.

The elongation shall be reported in inches, including the original two inches; that is, if the rupture occurs at eleven inches, or twelve inches, or thirteen inches, it will indicate that the stretch has been two to eleven, two to twelve, or two to thirteen. The piece shall be removed from the machine, but not snapped back; in no case shall the time consumed in removal from the machine exceed two seconds.

(c) MEASUREMENT OF PERMANENT SET.—After the piece has been removed from the machine the permanent elongation or recovery shall be measured by laying it upon a wooden table which is of the temperature of the room, and allowing it to rest for ten minutes. Immediately upon the expiration of the ten minutes a rule graduated to 1/32 inch shall be laid upon the piece and the elongation read in 1/32 of an inch, measuring the outside of the marks.

The per cent of elongation of the test piece above the original two inches shall represent its permanent elongation.

Tests for the determination of permanent set will be made upon a machine similar in principle to the one illustrated on the last page of these specifications.

TENSILE STRENGTH.

9. (a) The tensile strength shall be determined by stretching a test piece not previously tested in the tensile machine until it breaks. If the test piece breaks outside the marks, or in the wider portions of the piece, and the tensile strength is much below that called for in the specifications, it is probable that this piece is faulty and that another would meet the requirements. If the piece breaks outside the marks and yet shows a tensile strength above that called for in the specifications, it is probable that the piece is faulty and that its true tensile strength is higher than indicated. Since its recorded tensile strength exceeds that called for in the specifications, however, it shall not be necessary to retest.

Before any tests are made, the width of the test piece shall be determined at three points equidistant between the marks. The backing or irregularities of fabric impression shall be stripped

or buffed off and the thickness measured with the backing removed. It shall be determined at three points equidistant between the marks on the test piece, by means of a standard spring-gage micrometer (exerting a pressure of eight to twelve ounces), the disks of which are 1/2 inch in diameter. The measurements used in the computation of tensile strength shall be those read nearest the point of break. The disk of the micrometer shall be 1/2 inch in diameter when measuring thickness of the tube of all hose which has an inside diameter of one inch or under.

(b) INITIAL STRESS.—During the elongation and recovery test the initial stress shall be taken by connecting a spring balance with the piece under test. The number of pounds read on the balance at the maximum stretch shall then be computed in pounds per square inch and expressed as "initial stress."

PRESSURE TESTS.

10. (a) The hose shall be stretched out for inspection, connected to the pump, and filled with water, leaving the air cock open to allow the air to escape. The air cock shall then be closed and a pressure of ten pounds per square inch applied. The test shall then begin by taking original measurements without releasing the pressure.

(b) All pressure tests shall be made by using a hand or power water pump, and a standardized gage. The increase in pressure shall be made at the rate of 300 pounds per minute, and the hose under test shall be held for measurement not more than two minutes, unless otherwise called for in the specifications.

COMPOSITION.

11. (a) FRICTION.—Wherever, in the detail specifications, friction is mentioned it shall be made from a compound which will neither yield to acetone, any organic constituent foreign to *Hevea* rubbers, nor contain more sulphur than is necessary for vulcanizing, so that the percentage of sulphur in the rubber layers shall not be raised beyond the permissible amount.

(b) MATERIAL.—The (article) shall be properly vulcanized and shall be made from and shall have all the characteristics of a compound containing not less than per cent of washed and dried fine Para rubber, not more than per cent of sulphur, with the remainder suitable dry inorganic mineral fillers. The mineral fillers may contain barytes, but shall be practically free from sulphur in other forms and from any substance likely to have a deleterious effect on the rubber compound. The sulphur in barytes will not be included in the allowable sulphur content.

(c) SAMPLE FOR CHEMICAL ANALYSIS.—A sample taken for chemical analysis shall be sent intact to the laboratory for tests.

AVERAGE READING.

12. Since the physical properties of rubber vary noticeably in any given product, it may occasionally happen that tests are made upon a sample which will be of poor quality. The hose, belting, or packing will, as a whole, meet the requirements of the standard, but the particular piece taken may fall somewhat below it. To reject or accept a lot of hose because of its failure to meet one test under specifications would therefore be unfair. For this reason acceptance or rejection of an item offered for delivery shall be based on the average of at least four determinations for each quantity. In arriving at these averages no weight shall be given to tests which are obviously in error and do not represent true average conditions, e. g., cases in which the tensile strength is low on account of a small flaw in the article or the friction is low on account of a small flaw in the friction part. In other words, the intent of the specifications is to insure a high-grade article in every particular, and the intent of the methods of testing is to determine whether the article as a whole is of this high standard.

Deliveries of hose, packing, etc., which regularly meet certain provisions of the specifications, but quite as regularly fail to

meet others, are obviously improperly made and should be rejected.

REJECTIONS AND REPLACEMENTS.

13. All rubber materials shall be inspected and tested, so far as practicable, at the point of manufacture.

REPUBLIC RUBBER CORP. INCREASES CAPITAL.

The certificate of incorporation of The Republic Rubber Corp. has been amended to provide for—first, a preferred seven per cent cumulative stock consisting of 100,000 shares, par value \$10,000,000; second, 25,000 shares of second preferred eight per cent cumulative convertible stock, par value \$2,500,000; third, 650,000 shares of common stock without nominal or par value, being an increase of 400,000 shares over the present authorized common stock. The directors of the company have decided to offer 20,000 shares of the second preferred stock, par value \$2,000,000, and 100,000 shares of common stock without nominal or par value, to the common stockholders of the company for subscription pro rata to their present holdings. In other words, each common stockholder will be entitled to subscribe to as many shares of second preferred stock as will equal 10 per cent of his present holdings in common stock, and to five shares of common stock for each single share of second preferred stock to which he is entitled to subscribe. As stated elsewhere in this issue, the Republic Rubber Corp. has recently acquired the assets and factory of the Knight Tire & Rubber

Co., at Canton, Ohio. The gross sales of The Republic Rubber Corp. are now running at the rate of approximately \$18,000,000 per annum, more than three times the average annual volume of business done by the Republic and Knight companies for the three years previous to 1917, and more than double the volume of business done by those companies in any one of these years. During the six months' period ending August 31, 1918, the net profits of the Republic company were in excess of \$900,000.

CARLISLE IN NEW YORK.

The Carlisle Sales Co., Inc., has recently been incorporated in New York State, as noted in our issue of November 1, 1918, for the purpose of taking over the business of the Carlisle Cord Tire Sales Co. and the distribution of the products of the Carlisle Cord Tire Co., Inc., of Andover, Massachusetts. J. E. Demar is president of the corporation and L. Treboul, secretary. The concern has opened offices and stock rooms at 237 West 58th street, New York City.

KEYSTONE ELECTS DIRECTORS.

The Keystone Tire & Rubber Co., 1877 Broadway, New York City, has elected the following directors: Joel Jacobs (treasurer); L. Walter Lissberger, 1877 Broadway; Nathan J. Miller, Miller & Co., 120 Broadway; Julius Lichtenstein, American Sumatra Tobacco Co., 142 Water street, and Sydney Bernheim, Bernheim & Loewenthal, 35 Nassau street, all of New York City.

The outline above shows clearly the comprehensive and highly commendable plan adopted by the Hood Rubber Co., Watertown, Massachusetts, to maintain a stable body of efficient employees. Labor is becoming such a grave problem that all methods tending to build up an able and contented working force and to reduce the labor turnover to the minimum are money-savers of more than normal interest.

Trade Acceptances for the Rubber Goods Manufacturer.

By Russell Raymond Voorhees.

IN our discussion of trade acceptances in the May, 1917, issue, we took up the advantages that this financial paper offers to the buyer of rubber goods. We found just what the benefits are to the rubber goods dealer and that they are certainly vital enough to warrant every dealer using them when he makes time purchases. But in addition to the advantages that trade acceptances offer to the dealer they also possess equal advantages for the jobber and manufacturer. Every jobber or manufacturer of rubber goods should ask for trade acceptances when he sells goods on credit. They are just as valuable to him in his way as they are to the dealer when he makes a purchase.

In the first place, the use of trade acceptances will fix the exact amount of the bill at once. It is too often the case in business that when the time for payment comes the buyer may advance a derogatory claim with reference to the goods in order to defer the date of settlement. Of course, in many cases the claim is just, but at least it should have been taken up before the last minute.

Mistakes are bound to happen in any business, yet it would seem that the bulk of such mistakes could at least be rectified at once without waiting until the date of payment arrives. If a trade acceptance is asked for when a jobber or manufacturer sells the bill of goods there will be no come-back later as to the amount owing. Since the exact amount of the obligation is written across the face of the instrument and by endorsing it the buyer accepts the amount as correct, it can be seen that trade acceptances are a means of practically closing a transaction at the time of purchase.

One of the common abuses of business is the unearned discount. Time buyers all too often take off the regular cash discount when they come to pay their bills, and jobbers and manufacturers in many cases are helpless to remedy this evil. They fear that if they try to put a stop to this practice the buyer will take his trade elsewhere regardless of who is in the right. For this reason it is often allowed to run on, with the result that time buyers buy on the same terms as the cash customer, which is most unfair to the buyer and to the seller. Trade acceptances

are not subject to discount at the time of payment, and as they have the exact amount written on the face there can be no opportunity offered for taking an unearned discount at the time of settlement. The general use of trade acceptances will without doubt remove from business this more unhealthy practice and give to every jobber and manufacturer all that is due them.

In addition to the saving of unearned discounts, trade acceptances will give the seller of rubber goods a cheaper method of collecting his accounts. When the buyer of the goods gives the acceptance, he writes across the face of it the bank at which it is to be paid and when it falls due, and that bank attends to the collecting, thus removing a bother and an expense from the hands of the jobber or manufacturer. This certainly is an economic method.

Overbuying is

without doubt one of the big causes of failure in this country.

There is far too much speculation in the average business and sooner or later some companies fall by the wayside with large stocks on hand.

And just as surely as overbuying is one of the chief causes of failure, so is overcredit one of the chief causes for overbuying.

Too many dealers who buy on time take no thought of meeting their obligations, but plunge ahead until the day of reckoning.

When trade acceptances are substituted for the open account it is only a short

time before the poor risk is brought face to face with obligations that are due and many failures to meet them will prove his undoing. A buyer who gives an acceptance at the time of purchase will realize that he is making an obligation that he must meet, and it will generally be found that he will try harder to meet it than if it were simply an open account where promises can take the place of cash.

And right along this line there is a point that is worth mentioning. The loss that jobbers and manufacturers incur by means of bad accounts will be materially lowered. It will be but a short time, a few months, when the bad risk will be eliminated and when that is done it will be found that profits will be materially higher than at present. More accounts will be paid when due and less will be lost through failures.

Table showing the value of Trade Acceptances bought in the open market since the late went into effect and held by Federal Reserve Banks as per schedules on file with the Federal Reserve Board on dates specified, distributed by classes of accepting institutions.

Turnover is without doubt the secret of success in the game of merchandising, no matter whether one be a buyer or seller of goods. The ability to turn over capital often will mean that profits will be large, regardless of whether one is a retailer, jobber or manufacturer. And trade acceptances offer the means of turning money over often. When they are used a jobber or manufacturer will be able to realize cash on each and every transaction, and by so doing will be able to discount bills at once and use the money, instead of having it tied up in the business of others. Trade acceptances put the entire business on a cash basis and this is the cream of business.

Since this would be the case the need for large amounts of working capital will not be in evidence. A cash business does not require the working capital that a credit business does and in addition the net earnings, in proportion to capital invested, will be materially larger if trade acceptances are substituted for the present system of open accounts.

The jobber and manufacturer finds that trade acceptances offer him an ideal method of raising cash for use in his business. At present he can get it on his own note or by pledging his accounts receivable, but neither method is any too satisfactory and both are more expensive than discounting acceptances which furnish the required capital as quickly and cheaply as it is possible to do it. The use of acceptances tends to give the jobber or manufacturer a better standing at his bank. If they are substituted for the open account his bank will see who his customers are, and there is no better way to obtain influence at your bank than to let them know who your customers are.

Trade acceptances enlarge your borrowing facilities. At present the amount that can be loaned on your own one-name paper may, perhaps, be limited, but with trade acceptances it is different. A bank is limited in the amount it can loan on the paper of any one acceptor, but since a jobber or manufacturer has many customers the banks can loan up to the limit on the paper accepted by each customer, and in that way the jobber or manufacturer will be able to get many times the amount of money that he would have been able to get under the present method of one-name paper. It can be truthfully said that trade acceptances offer unlimited borrowing facilities.

Trade acceptances give the seller of goods a chance to plan his business with some degree of assurance that his plans will be carried out. He is assured that every month he will have a more or less fixed income, a cash income, and this means that he can build up his business without the worry of collecting the money that is owing him.

For the jobber or manufacturer who does not need the money at once, trade acceptances are also of vital service. Their use will remove from business many of the abuses that have been discussed here and in addition can be used as a reserve to be discounted in case of great financial stress or whenever the occasion calls for more capital than the house has at that time. There are several of the larger houses which ask for trade acceptances but do not discount them. They employ them because they eliminate from business the abuse of the unearned cash discount, the protested account and other petty grievances, and in addition give them a quick method of raising additional capital should the occasion arise.

Taken all in all, trade acceptances are of vital use for the jobber or manufacturer of rubber goods. We have seen how they would benefit the retailer, also how they will benefit the jobber and manufacturer. To be sure, they are still new and many large houses are not fully aware of their value. But under conditions such as we have at present, when every turn of capital means something, it would be well for the trade as a whole to study and make use of them as valuable aids to modern business progress.

The practice of individual thrift is a patriotic duty and a necessity.

NEW INCORPORATIONS.

Amazon Tire Co., Inc., The, October 23 (New York), \$10,000. F. H. Findley, 246 East 207th street, New York City; O. Moynihan, 360 West Market street, L. J. Schott, 249 South Arlington street—both of Akron, Ohio. To manufacture auto tires and rubber goods.

American Webbing Manufacturers Export Corp., November 23 (New York), \$100,000. M. Griffin, 812 Suburban Place, Bronx; E. K. Cunningham, 485 Central Park West, both of New York City; C. H. McLean, Passaic, New Jersey. To export webbing and webbing products.

Chicago Scrap Rubber Base Co., November 7 (Illinois), \$5,000. W. A. Roonet, L. Gaizat, E. J. Hess. Principal office 2204 South Throop street, Chicago, Illinois. To manufacture, buy, sell, repair and deal in vehicle parts of all descriptions, accessories, scrap rubber, etc.

Davenport Tire & Rubber Co., Inc., November 14 (New York), \$1,000. Sydney Bernheim, 35 Nassau street, New York City; C. A. Weldon, 591 7th street, M. Kittay, 823 Monroe street—both of Brooklyn, N. Y. To conduct tire manufacturing business.

Gettelt Co., Noble H., November 14 (Delaware), \$40,000 preferred stock, 550 shares common stock without nominal or par value. C. L. Rimlinger, M. M. Clancy, P. B. Drew—all of Wilmington, Delaware. Principal office with the Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture and deal in tires and inner tubes for automobiles.

Glamorgan Tire & Rubber Corp., October 21 (Delaware), \$250,000. M. Howells, Orrville P. Jones, Warren—all of Ohio; J. T. Thomas, Woodlawn, Pennsylvania. To manufacture and deal in automobile and bicycle tires, inner tubes and rubber accessories.

Industrial Supervision Co., Inc., November 8 (New York), \$4,000. S. Bernheim, 35 Nassau street, New York City; C. A. Weldon, 591 7th street, M. Kittay, 723 Monroe street—both of Brooklyn—all of New York. To supervise the manufacture of tires, etc.

Miller Rubber Co., W. T., September 17 (Indiana), \$10,000. W. T. and D. Miller, W. W. Shelley—all of Elkhart County, Indiana. Principal office, Elkhart, Indiana. To manufacture, purchase and sell motor tires, accessories and supplies and all kinds of vulcanizers and all such machinery used in the process of making and repairing motor tires, accessories and supplies.

National Wool Stock Co., October 2 (Delaware), \$300,000. C. L. Rimlinger, M. M. Clancy, F. A. Armstrong, all of Wilmington, Delaware. Principal office within the State, with the Corporation Trust Co. of America, Du Pont building, Wilmington, Delaware. To deal in rubber and scrap materials, etc.

Preston Tire Co., of Houston, Texas, September 26 (Texas), \$15,000. C. and N. J. Kavanagh, C. R. Bender—all of Houston, Texas. To purchase and sell wares and merchandise and agricultural and farm products.

Record Tire & Mfg. Co., Inc., November 21 (New York), \$50,000. J. A. Roberts, 256 Broadway, J. H. Devereux, 233 Broadway, G. N. Shafer, 324 West 103rd street—all of New York City. To manufacture tires, tubes, etc.

Truck Tire Sales & Service Co., October 25 (New Jersey), \$50,000. J. M. and E. Goodridge, T. N. Balderston—all of 42 Barnes street, Trenton, New Jersey. Principal office, 42 Barnes street, Trenton, New Jersey. Agent in charge, T. N. Balderston. To deal in truck tires.

Yarnall-Waring Co., February 11 (Delaware), \$2,000. C. L. Rimlinger, M. M. Clancy, F. A. Armstrong—all of Wilmington, Delaware. Principal office with the Corporation Trust Co. of America, Du Pont Building, Wilmington, Delaware. To manufacture and deal in valves, clamps, gages and similar appliances for boilers, motors and other machinery.

Jar-Ring Tests.¹

By Charles P. Fox.

Ring out the odd,
Ring in the new,
Ring out the false,
Ring in the true.
—Tennyson.

FOLLOWING up a complaint made by Mrs. A. H. Throckmorton, 2600 Wellington road, Cleveland, Ohio, in October, 1917, concerning the loss of canned fruit by spoilage, due to faulty jar rings, led to a preliminary investigation of the quality of jar-rings sold in Cleveland. The results of this examination showed the need of a thorough control of the jar-ring trade.

In the latter part of 1917 and the early part of 1918, 388 samples, representing about 60 brands of jar-rings, were examined. On the basis of brands examined, approximately 70 per cent were safe, 20 per cent doubtful, and 10 per cent worthless.

By "safe" we mean that the ring is suitable for use upon the old style Mason screw-top jar, and using the "cold pack" system of canning.

A "doubtful" ring is one which is good while fresh but which rapidly perishes when exposed to air and sunlight, or has been kept for a long time in stock.

A "worthless" ring is wholly unfit for use. It may be too thin, "perished," "weak," or dirty (covered with soapstone or sulphur), or have an objectionable odor.

These tests will determine the quality of a ring:

PINCHING TEST.—Double the ring upon itself and pinch firmly; ring must not crack.

TWISTING TEST.—Twist ring quickly two or three turns, holding ring under a slight tension; ring must not break or tear.

PULLING TEST.—Stretch ring by pulling and note strength and

quired in the cold pack system. Many rings, apparently safe by other tests, when tested in this way show unfitness by becoming soft, are cut through by the lid, or lose their shape so that they are easily misplaced and the seal broken.

Jar-rings are sold in bulk or cartons. Cartons contain one dozen rings. Cartons with short count and with broken rings have been found in several cases. The popular price is 10 cents per dozen; however, price is no guide to quality. Good-quality rings often sell for less money than an inferior grade.

Good rings can be bought; use them. Housewives should remember that jar rings, like wedding rings, must be made of good material. The chemist applies the "acid test" to the wedding ring. The highest grade of jar rings will stand the "alkali test." Poor rings will not. Low-grade rings—those made up largely of mineral matter and oil substitutes, the kind that do not age well—"go to pieces" when treated with boiling alcoholic soda.

This test, while reliable, is rather severe, is inconvenient to apply, and can only be used successfully by a chemist. A pre-gaging test carried out by heating the rings in a water oven for 10 hours often indicates what results may be expected of a ring when kept in stock for a long time.

A mid-summer examination of the jar-ring trade in Dayton, Ohio, shows a slightly better condition than expected. Dayton is a smaller city than Cleveland, and, perhaps, its housewives are

PULLING TEST.

PINCHING TEST.

TWISTING TEST.

elasticity. A good ring should require at least a 15-pound pull before breaking. We have tested rings that required more than a 25-pound pull to break them.

A general or "once over" test will often show the presence of much soapstone in the carton. While soapstone may be harmless, it is unnecessary. Good rings do not require it. Its presence indicates either poor material or careless factory methods, and it makes extra work for the busy housewife.

Another thing to be looked after is size. A standard ring—one that will give best results under all conditions—should be 1/12-inch thick and 10/32-inch wide.

These tests should be made at the counter at time of purchase. If convenient, or in doubt, test out the ring by adjusting to a jar submerged in boiling water, following closely the conditions re-

more careful buyers. They take nothing for granted and usually make their purchases in person and with great care. They demand good quality.

A smaller number of brands of jar-rings are offered for sale and they are of a better grade. Several of the standard brands are represented and there is a great demand for a certain well-known make, a fact which again proves the truth of the slogan, "It pays to advertise."

—AUTHOR'S NOTE.—The material in this paper was gathered in work along "food conservation" lines.

These tests are the results of adoption and application of information obtained from many sources. While they answer the purpose intended, they are not perfect, and are open to criticism from the standpoint of ultra-technical investigators. The object in presenting the subject was twofold: (1) to bring before the public the condition of the jar-ring situation and the need of jar-ring inspection, and (2) to get manufacturers, through their technical departments, interested in developing specifications and tests for this article.

The interest shown by the rubber section of the American Chemical Society at the Cleveland meeting approves its presentation.

¹Read at the annual meeting of the rubber section of the American Chemical Society, held at Cleveland, Ohio, September 11-12, 1918.

What the Rubber Chemists Are Doing.

THEORY OF LATEX COAGULATION.

In a paper on the theory of latex coagulation, by G. Stafford Whitby, published in the "Agricultural Bulletin of the Federal Malay States," June, 1918, the author states that he has confirmed the views of Barrowcliff expressed in a recent article (THE INDIA RUBBER WORLD, October 1, 1918), namely, that the agency responsible for the natural coagulation of *Hevea* latex is enzymic; not only natural coagulation, but coagulation resulting from the addition of acetic acid appears to be due to enzymic activity. The function of the acid in acetic acid coagulation appears to be the activation of a coagulating enzyme. Barrowcliff found that the latex which had been sterilized by running it into an equal volume of boiling water was no longer coagulated by acetic acid, but became so if treated with a few drops of fresh latex. The author remarks that the conclusion to which this observation points—that the function of acetic acid in the ordinary process of latex coagulation is to activate an enzyme—resolves certain anomalies involved in the view that the separation of rubber from its colloidal emulsion by acid is a physico-chemical phenomenon in the ordinary sense.

The author states that the object of his paper is primarily to compare, in certain aspects, the coagulation of latex with the coagulation of cow's milk and to record a number of experimental results. Whitby makes closer examination of certain aspects of the analogy indicated by Barrowcliff between latex coagulation and the coagulation of milk by rennin. Somewhat condensed, the author's studies are given as follows:

1. COAGULATION OF STERILIZED MILK. Boiled milk can be coagulated by added acid in the same way as unboiled milk. Sterilized cow's milk in contradistinction to latex sterilized by Barrowcliff's procedure, was coagulable with acetic acid.

2. CRITICAL CONCENTRATION OF ACID FOR MILK COAGULATION. In the coagulation of milk by added acetic acid or added lactic acid there is what may be called a critical concentration of acid. Below this concentration no coagulation occurs. Even when the acid added is only ten per cent less than this quantity no coagulation occurs, but when the critical amount or more is added immediate clotting takes place.

This behavior of milk stands in very marked contrast with the behavior of *Hevea* latex towards increasing amounts of added acid. In the case of latex there is no critical concentration at which immediate clotting occurs and below which no clotting is obtained. There is a wide range over which acid concentration can be varied and great differences in the rapidity with which coagulation can be brought about.

3. ANTI-COAGULATING EFFECT OF A DEFICIT OF ACETIC ACID IN MILK. A more striking contrast with the effect of added acetic acid on *Hevea* latex is that an amount of acetic acid below the critical amount not only fails to produce coagulation in milk, but has a pronounced anti-coagulating effect due presumably to an unfavorable effect on the growth of the lactic acid bacterium. In the case of *Hevea* latex, acetic acid in amounts less than that necessary for rapid coagulation has no anti-coagulating effect. Diminishing the amount of acid added simply renders the coagulation slower. The fact that acetic acid has no anti-coagulating effect on *Hevea* latex tells against the bacterial hypothesis of latex coagulation.

4. TIME FACTOR IN THE FORMATION OF A CLOT. The clotting of milk by added acid is a practically instantaneous process, whereas the time occupied by the formation of a clot in latex may, by adjustment of the amount of acid added, be varied over a period of from three minutes to eight hours. There is thus, negatively, a failure of analogy between latex coagulation and the acid coagulation of milk in regard to the time factor, but there

is, positively, a close analogy between the effect of acids on latex coagulation and their effect on the coagulation of milk by rennin, as shown by the results of Gerber.

In the absence of all other considerations, the slowness with which coagulation takes place in ordinary plantation practice would seem to afford a strong presumption that the coagulation of latex under the influence of added acid is not a direct physical phenomenon but involves the activity of an enzyme.

5. ACID CONCENTRATION FOR NATURAL COAGULATION. In the case of the coagulation of milk by the addition of acid or by natural souring, the occurrence of coagulation appears to depend substantially upon the presence of a certain concentration of acid. When, as a result of natural souring, the acidity has reached a certain point, clotting occurs. Under ordinary conditions of souring at 20 degrees C. milk will coagulate when the lactic acid reaches 0.6 to 0.7 per cent.

In the case of latex the development of acidity has not been studied as closely as in the case of milk, but it seems clear that the natural coagulation of latex is not a simple function of its acidity. It has been demonstrated experimentally by the author that the amount of acidity engendered naturally in latex may be very greatly in excess of that which it would be necessary to add to fresh latex in order to produce coagulation which reveals a further failure of analogy between latex coagulation and that of milk.

6. NATURE OF THE CLOT. In outward character, particularly as regards coherency, the clot produced in milk by enzymic action is more analogous to the ordinary rubber coagulum than is the clot produced in milk by natural or added acid. The ordinary rubber coagulum resembles the coherent clot produced by rennin rather than the floccular clot which is first produced in milk by souring or by the addition of acids.

7. INFLUENCE OF CALCIUM SALTS. That calcium chloride is capable of leading to the coagulation of latex was recorded some years ago. It has been suggested by Eaton that the influence of soluble calcium salts in promoting natural coagulation is due to the presence of calcium being favorable to certain anaerobic organisms. There does not, however, seem to be any analogy for this suggestion, either in the coagulation of blood or in the acid or enzymic coagulation of milk. An analogy between the action of calcium chloride on latex and its action on the enzymic coagulation of milk is indicated in its activation of rennin.

8. BACTERICIDES AND ENZYME PARALYZERS. Natural coagulation is not prevented or retarded by toluol, thymol or chloroform water but is prevented by such an agent as hydrocyanic acid. Hydrogen sulphide, although acidic, retards or prevents coagulation.

9. INFLUENCE OF OXYGEN. In apparent contrast to the case of milk the natural coagulation of *Hevea* latex is not dependent upon the surface exposed.

10. POSSIBLE SIGNIFICANCE OF THE "GAP." Barrowcliff points out that, on the view that an enzyme is concerned in latex coagulation, the fact that hydrochloric acid in certain comparatively high concentrations fails to coagulate latex may be due to the destruction or paralysis of the enzyme by this concentration of acid. In such case, at still higher concentrations, the acid would appear to have a direct clotting effect. It has been shown that on adding increasing quantities of hydrochloric acid to samples of latex a point is reached comparatively soon at which no coagulation occurs, but that on continuing to increase the amount of acid added, a point is reached at which coagulation again begins to take place. There is a gap over which no coagulation occurs. The position of this gap was found to be approximately from a concentration of hydrochloric acid corresponding to three

cc. one in ten hydrochloric per 100 cc. of ten per cent latex to ten cc., one in ten hydrochloric per 100 cc. ten per cent latex.

A similarly located gap over which no coagulation, or only very incomplete coagulation occurs, is noticed in the case of nitric acid.

CONCLUSION.

The coagulation of cow's milk under the influence of rennin offers a much closer analogy to the coagulation of *Hevea* latex than does the clotting of milk by added acids or natural souring, and the salient agency in latex coagulation is probably enzymic.

The initial formation of the clot in fresh latex allowed to undergo natural change is probably due to enzymic action and the same agency, activated by acids, is probably responsible for acetic coagulation. Bacterial action is viewed, in regard to the occurrence of natural coagulation in latex, as a secondary factor only.

In addition to coagulation taking place ordinarily under the influence of an enzyme, there may occur under special conditions coagulation of other types—viz., the delayed coagulation in latex which has been subjected to sterilization, due to the ultimate putrefactive decomposition of the latex; the non-coherent coagulation produced by heat or by protein precipitants, particularly by tannic acid, and not improperly the coagulation produced by hydrochloric and nitric acids on the far side of the "gap" which is associated with the addition of increasing quantities of these acids to latex.

Very much remains for investigation in connection with latex coagulation. It is believed that at the present stage the enzymic hypothesis of coagulation affords the best explanation of the facts.

OYOGALITH, THE FRENCH GALALITH.

A French manufacturing company, called the Oyonnaxian Co., located at Oyonnax, a well-known French industrial center, has perfected a new non-inflammable product from casein similar but superior to German galalith. This product is designated as oyogalith and is sold under that name, manufactured into such articles as buttons, buckles, rings, combs, knife handles, etc. This new material is cited by "Le Caoutchouc et la Gutta-Percha" as one of the many successful substitutes for German-made material which has been developed during the war.

WATERPROOFING BRAIDED CORD.

Cord can be waterproofed either before or after braiding. Various methods of proofing, says the "Textile World Record," can be used in either case. For example, cotton yarn may be proofed in a solution of 30 pounds of alum in 50 gallons of water to which 30 pounds of sugar of lead has been added. The yarn must be soaked for two hours, after which it is lifted out of the solution and drained, then passed through a weak soap solution, which results in a deposit of an aluminate of the soap fat in the yarn. Or one can proof yarn in the following solution: dissolve 50 pounds of alum in 500 pounds of water, soak 50 pounds of glue in 10 gallons of water overnight, heat to boiling in the morning and when solution is complete stir in 2½ pounds of tannic acid and 1 pound of silicate of soda, add the entire quantity to the alum solution, mix thoroughly and cool to about 170 degrees F., immerse the yarn till saturated, squeeze and dry.

A mixture of rubber and paraffin wax waterproofs well; it also insulates. Melt 5 pounds of paraffin wax in an iron pot, add 1¼ pounds of scrap rubber, heat until rubber is dissolved, cool and permit solidification, then cut into cubes for use. Weigh the yarn or other material to be proofed in a dry state; for every eight pounds allow one gallon of benzine in which three ounces of the paraffin rubber mixture has been dissolved. Soak the yarn in the solution, which will soon be soaked up, then let the benzine evaporate; a waterproof deposit will be left on the yarn. If cable has been so treated, a finish may be given by

passing it between heated grooved rollers, cable can be rubbed by paraffin wax before going through the rollers. Finally, cable can also be waterproofed by drawing it through melted paraffin in a long shallow pan, the cable being kept below the surface by guide rollers; upon leaving the pan of wax it is drawn between wipers, then through grooved finishing rollers and coiled.

DEPOLYMERIZATION OF RAW RUBBER.

K. Kawakami presents his views on the depolymerization of raw rubber in the "Journal of Chemical Industry," Tokio, Japan, of which the following abstract is made by the "Journal of the Society of Chemical Industry," London, August 31, 1918. The author criticizes and points out inaccuracies in the experiments by Takenchi, but agrees with the general proposition that viscosity measurements may be of value in controlling the processes of manufacture. The viscosity is not an absolute function of depolymerization, since it is affected also by the non-caoutchoue matters, namely, proteins and rubber resins, which will not change in the same proportion as the caoutchouc. The degree of variation of the acetone extract during mastication falls within the limits of experimental error. The viscosity of raw rubber cannot be used as a sole measure of valuation, because there are several factors of value which have nothing to do with the viscosity of the solution: for instance, the amount of impurities and loss in washing, also the physical and chemical properties of the vulcanized products. The proper periods of mastication obtained from Takenchi's curves, on the basis of an absolute viscosity of 0.1 in the rubber solution, work out at 40 minutes for plantation and 80 to 90 minutes for Brazilian *Hevea*, but these periods appear far too long from a technical point of view.

MOISTURE IN RAW RUBBER.

The following abstract is from a paper by G. Stafford Whitby, M. Sc., A. R. C. S. in the "Journal of the Society of Chemical Industry," August 31, 1918:

The present paper records observations made under actual tropical conditions on the variation of the water-content of raw rubber and the relation of this quantity to the humidity of the atmosphere, the form of the rubber, and the presence of serum solids. The observations were confined to rubber produced by acetic acid coagulation from the latex of *Hevea Brasiliensis*. The moisture content of both crêpe and sheet rubber was observed to exhibit a diurnal change, being on a normal day in the Eastern tropics, very markedly higher in the early morning than in the late afternoon. There is a general parallelism between the water-content of crêpe and the degree of humidity of the atmosphere.

The course of drying samples of latex crêpe from shortly after preparation to the time when they were dry showed that after the percentage of water had fallen to about one per cent the samples showed a negative state of drying between sunset to sunrise, the most humid part of the day, the rate of drying being influenced by variations in the degree of humidity of the atmosphere. Sheet rubber was found to be less sensitive than crêpe, as regards its moisture-content, to changes in the degree of humidity of the surrounding atmosphere. It exhibited smaller variations than crêpe in the percentage of water present at different times retaining a higher percentage of water in the middle of a hot, dry day, and absorbing less moisture over night. It is probable that the higher moisture-retaining capacity which sheet samples show under usual commercial conditions, depends upon the fact that the serum solids are removed from the coagulum less completely in the preparation of sheet than in the preparation of crêpes.

The greater readiness with which crêpe, as compared with sheet, increases its water-content in a humid atmosphere may probably be regarded as due to the much greater surface which

this form presents. It would seem that the greater the area of a rubber sample in relation to the weight, the greater is the sensitivity, as regards water-content, to changes in the humidity of the surrounding atmosphere.

The author's chief conclusions are given as follows: The percentage of moisture in raw rubber in the form of sheet or crêpe varies considerably with the degree of humidity of the surrounding atmosphere. In rubber-producing climates it shows a diurnal variation. Sheet rubber tends to retain a higher percentage of moisture than crêpe. The moisture-retaining capacity of raw rubber is closely associated with the presence of serum solids. The latter are very hygroscopic.

CHEMICAL PATENTS. THE UNITED STATES.

ELASTIC MASS.—An elastic mass and its manufacture. A vulcanized composition consisting of linseed oil which has been oxidized at a temperature of 200-250 degrees C., aluminum stearate, a mineral hydrocarbon of high melting point, an inert filler, and sulphur. (Eduard Salomon Ali Cohen, The Hague, Netherlands. United States Patent No. 1,280,129.)

VULCANIZING PROCESS AND COMPOUND.—Process of vulcanizing rubber-like material which comprises heating, under vulcanizing conditions, a mixture comprising such rubber-like material, a sulphur material and amino menthyl isopropyl benzene. (Chester E. Andrews, assignor to The Walker Chemical Company, both of Pittsburgh, Pennsylvania. United States Patent No. 1,280,940.)

THE UNITED KINGDOM.

SUBSTITUTES FOR EBONITE AND PRODUCT.—Ebonite substitute is derived from waste or new rubber dissolved in a vulcanizable oil such as rape seed oil, with which has been mixed by heat paraffin wax, stearin, or similar substances, and also resinous material. To this mixture is added finely divided filling material, sulphur and other vulcanizing material. The plastic mass is pressed or molded and vulcanized by steam. (Naamloze Venootschap Nederlandsche-Maatschappij tot Exploitatie Van Optimiet Fabrieken, 20, Van Beuningen-sstraat, Amsterdam, assignees of S. van Raap, 102, Weesperzijde, Amsterdam. British Patent No. 118,270.)

VULCANIZING INDIA RUBBER.—The invention consists in heating the rubber, etc., previously mixed with a vulcanizing agent, and discontinuing the supply of heat when the rubber has expanded to an extent indicative of the degree of vulcanization derived. (W. J. Mellersh-Jackson, 28 Southampton Buildings, London. [Morgan & Wright, Detroit, Michigan, U. S. A.] British Patent No. 118,305.)

THE DOMINION OF CANADA.

RUBBER VULCANIZING PROCESS.—A method of accelerating a vulcanizing process which consists in adding to the rubber mixture an accelerator comprising caustic alkali dissolved in glycerol or glycol. (Douglas Frank Twiss, Sutton Coldfield, Warwick, assignor to The Dunlop Rubber Company, Westminster, London, both in England. Canadian Patent No. 185,317.)

THE FRENCH REPUBLIC.

RUBBER SUBSTITUTE AND PROCESS.—A composition consisting of fish oil or fish scrap relatively rich in fixed oil and a reducing agent, probably sulphur, by which under suitable treatment a commercial product results. (The Western Rubber Co., Tacoma, Wash., U. S. A., French patent No. 487,989.)

CALCULATION OF PRESSURE OF SOLID TIRES ON WHEEL RIMS.

E. Garabiol in "Le Caoutchouc et la Gutta-Percha," October 15, 1918, gives the derivation of a mathematical formula for calculating the compression required to secure the non-slip attachment of steel-rim solid tires to wheels under varying conditions of load and speed, giving also the details of calculation in an example.

LABORATORY APPARATUS.

A POWERFUL GAS BURNER.

A VERY effective design of gas burner is the "Hughes-Amlasp" shown in the illustration. It is intended for general laboratory use, producing a flame of highest temperature without the use of blast. It burns either natural or artificial gas, and has means for air and gas regulation. By a special perforation system on the chimney, the gas is evenly distributed and mixed, giving an extremely hot flame, making this burner the closest approach to the blast burner. The temperature of the flame is uniform throughout; diameter of the flame, nine-sixteenths of an inch.—(American Laboratory Specialists, Pittsburgh, Pennsylvania.)

HUGHES-AMLASP
GAS BURNER.

RESILIOMETER.

The recently invented instrument known as the resiliometer is being adopted in rubber works laboratories for measuring the resiliency of cured rubber. The resiliometer was originally devised to measure the thickness, hardness and resiliency of mechanical felts for gaskets, washers and piano hammers. It is essentially a combination of a dial type micrometer with a presser foot and platform upon which the material to be tested is placed and a reaction device for determining the compressibility and resilience of the material.

THE WIDNEY RESILIOMETER.

To determine hardness, pressure is exerted on the material under the presser foot by means of the weight attached to the quadrant which sinks the presser foot into the material. The dial reading of thickness after compression, expressed in percentage of the reading of the original thickness, gives the degree of hardness. As the weight is removed after the hardness reading has been taken, the pressure of the weight is entirely released from the presser foot and another reading taken, thus giving the immediate resiliency of the material. (The Widney Company, 320 South Jefferson street, Chicago, Illinois.)

RHOTANIUM WARE.

Rhotanium is stated to be the only and original gold-palladium alloy. It is made in two grades for chemical purposes. Rhotanium "A" in its resistance to alkalis is superior to platinum, and its loss by volatilization at high temperature is also less than for platinum, with melting point at 1,253 degrees C. Rhotanium "C" has a melting point of 1,425 degrees C. Rhotanium ware for laboratory uses is made in all the forms for which platinum has ordinarily been used, with equal satisfaction in service and at much lower prices. (Palo Co., New York City.)

VISCOSIMETER.—A torsion viscosimeter consisting of a torsion element, means for indicating angular deflection and an electric heating coil for controlling the temperature of the substance under test. (Ross F. MacMichel, Auburn, Washington. United States Patent No. 1,281,042.)

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

New Machines and Appliances.

THE WARWICK RUBBER TRIMMER.

THERE are several types of overflow-trimming machines employing different forms of mechanical construction in accordance with the work to be performed.

The Warwick machine is designed to remove the rind from moulded rubber goods in large quantities, and employs a new mechanical principle in that the carriage supporting the die reciprocates under a revolving roller. Dies are made conforming to the particular article to be trimmed. In the case of rubber heels, the corresponding die is clamped to the platen and the operator places an untrimmed heel in the die. The machine is started by pressure on the treadle and the carriage carries the die under the roller which cuts the overflow. The finished heel is automatically ejected at the back of the machine and the carriage returns and stops, when the operation is repeated.

The output is limited only by the dexterity of the operator. The output is limited only by the dexterity of the operator, be done on the machine. (Rumrill & Co., 52-58 Purchase St., Boston, Massachusetts.)

OVERFLOW TRIMMER.

TIRE-BEAD TRIMMER.

Trimming tire beads by hand is an obsolete process in modern plants, due entirely to the development of special bead-trimming machines. A row of hand bead-trimmers wielding heavy shears is rarely seen these days when labor-saving and production are the prime factors in tire making.

While the bead-trimmer shown in the accompanying illustration is familiar to most tire manufacturers, the fact that the

BRIDGEWATER TIRE BEAD TRIMMER.

present machine is the ultimate embodiment of many improvements, makes it worthy of mention.

The machine is simple to operate and in fact it is said that one boy can handle the bead output of the average tire plant, on this trimmer. Reduced to figures, the makers claim that this machine will trim about 90 feet of clincher bead per minute and 15 feet of straight side bead per minute. (Bridgewater Machine Co., W. E. Wilson, selling agent, Akron, Ohio.)

THE "U. E." PLANTATION SCRAP-WASHER.

The washer here pictured is specially designed for the purpose of producing clean crêpe from scrap, or blending tree scrap, bark shavings and earth pickings for the manufacture of uniform crêpe. Moreover, by washing out the sand, excessive wear

A PLANTATION SCRAP WASHER.

on the rolls of the crêping and macerating machines is prevented. The machine and driving shaft are mounted on a rigid bed plate, and the belt-driven shaft is provided with a friction clutch for starting and stopping the machine. On the shaft is keyed a machine molded double helical pinion that meshes with a large gear of similar construction, keyed to the washer-shaft on which are mounted solid disks that revolve within the casing.

The operator enters the machine, engage the clutch, thereby starting the disks revolving, then open the bottom valve and turn on a full head of water, allowing it to flow straight through the machine without flooding the hopper. In treating ordinary bark shavings containing about 30 per cent of rubber, fill the hopper with shavings half way up, and when the machine has worked this charge for a few minutes and passed away some of the bark, leaving space for more, refill hopper half way up. After the rubber is cleaned, close the bottom valve and flood the hopper with water, allowing the rubber to float to the surface, when it can be picked out by hand. Do not stop the machine, but allow the disks to rotate to enable the rubber that may be at the bottom of the hopper to be worked free and float to the surface.

To obtain the maximum results, remove the rubber as soon as it is formed into lumps, as by this time 95 per cent of the impurities is removed and the remaining 5 per cent can be washed away by the crêping machine when the lumps are being laced up and rolled into sheets. (United Engineers, Limited, Singapore, Federated Malay States.)

TRANSFER-PRINTING ON INNER TUBES.

The advent of the automobile called for a new kind of printing, that of transfers for imprinting the size and brand on the inner tube. In the early stages of the tube industry, the size and name were put on with stencils, a process neither satisfactory nor economical. After various stages of development, printed transfers were found to be the best.

Although there are different kinds and grades of transfers, all fundamentally alike, the best results, however, are secured by thin cloth, glazed on one side and printed with a sizing and then finished with a copper bronze. The greatly increased cost of cotton, as well as labor, makes these expensive. In curing the tube, the action of the sulphur causes the bronze to change to a dense black. The next best process is to print on the cloth with a special black ink.

Even before the increase of the price of cloth, many tube makers had adopted the use of paper transfers, as they were

much cheaper and gave satisfactory results so far as the transferring qualities are concerned. The only difference in results between the cloth and paper transfers is that of removing the stock after the tube comes from the vulcanizer. The cloth can be readily stripped from the tube, while the paper sticks more or less, according to the compound and the local conditions. Paper labels can be printed with bronze or black ink. In either case special ink and paper are used; the former must not dry hard, and the latter must not absorb the ink. It may be truthfully said that paper perfectly satisfactory for some makers has not been found to work under all conditions.

Printing transfers is a specialty for other reasons than the use of cloth, special paper and bronze or ink, as the type and cuts must be the reverse of those used for regular printing, except that of offset work, the imitation of lithograph, which has practically superseded lithography. After the transfer is printed the reverse of the regular way, it is placed on the sheet of rubber, wrapped around the tube mandrel which is then put in the vulcanizer and subjected to the curing heat. When the tube is taken from the vulcanizer the ink or bronze has left the cloth or paper and been transferred to the tube. (The Goshen Printery, Goshen, Indiana.)

MACHINERY PATENTS. A DUST-PROOF MIXER.

THIS machine embodies radical improvements in the mixer described in THE INDIA RUBBER WORLD, July 1, 1917, such as a dust-proof hopper and a water-cooled feeding weight.

This invention employs, as in the previous one, casing A en-

closing two parallel cylindrical chambers B and C, in which rotary blades D and E are mounted. The upper chamber F is open to the lower chambers. Casing G is provided with an opening on one side communicating with hopper H through which material is fed. Chamber F and that portion of the casing below the hopper-opening form a neck, the cross-sectional width of which is no greater than the distance between the centers of the blade axes. The length of the neck is equal to or greater than $1\frac{1}{2}$ times the diameter of the blades and its cross-sectional area is more, and no less than $1\frac{1}{4}$ times the areas of the mixing chambers, excluding the space occupied by the blades.

The material is forced down by weight I that is attached to the lower end of a piston-rod operating in cylinder J, and may be raised or lowered by any desired power. Preferably the length of the neck, where it is enclosed by four sides, should permit the weight to travel vertically a distance equal to two or more times the diameter of the rotary blades. By proportioning the neck to the size of the cylinders, the operation of feeding and treating bulky material is greatly facilitated. The hopper is provided with a cover consisting of a wire frame covered with fabric which admits air but prevents the escape of dust. (Fernley H. Banbury, Ansonia, Connecticut, assignor to Birmingham Iron Foundry, Derby, Connecticut. United States patent No. 1,279,220.)

United States patent No. 1,279,824 issued to the same inventor and assignor, covers an improved feeding chute, a blower for removing accumulations from the weight, provision for the escape of air and a rod for indicating the position of the weight.

"Rubber Machinery," by Henry C. Pearson, should be in the library of every progressive rubber man.

OTHER MACHINERY PATENTS. THE UNITED STATES.

- N^o 1,278,784. Shaping device for tire-building machine. F. C. Morton, Cambridge, Massachusetts, assignor of one-half to F. B. Carlisle, Cranston, Rhode Island, and one-fourth to The Goodyear Tire & Rubber Co., Akron, Ohio.
- 1,279,214. Tire Core. C. F. Ames, Akron, Ohio.
- 1,279,337. Tire-making machine. W. B. Harsel, assignor to The Goodyear Tire & Rubber Co., both of Akron, Ohio.
- 1,279,404. Annular shuttle for tire-wrapping machine. H. I. Morris, San Diego, California, assignor to The De Laski and Thropp Circular Woven Tire Co., Trenton, New Jersey.
- 1,279,465. Rotary shuttle for tire-wrapping machine. H. I. Morris, San Diego, California, assignor to The De Laski and Thropp Circular Woven Tire Co., Trenton, New Jersey.
- 1,280,003. Repair vulcanizer. R. P. Espinosa, Los Angeles, California.
- 1,280,230. Repair vulcanizer. M. P. Janisch, Milwaukee, assignor to D. W. Jones, Waupun—both in Wisconsin.
- 1,280,492. Fabric-coating and calendaring apparatus. F. E. Kip, Montclair, and Edwin P. Ford, Morristown, assignors to The Duratex Co., Newark all in New Jersey.

THE DOMINION OF CANADA.

- 185,197. Collapsible tire-core. T. Midgley, Sr., Columbus, and T. Midgley, Jr., Dayton, co-inventors, both in Ohio, U. S. A.
- 185,417. Ball mould. The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada, assignee of H. Z. Cobb, Winchester, Massachusetts, U. S. A.

- 185,822. Tire vulcanizer. W. Reilly, Kerrisdale, British Columbia, Canada.
- 185,859. Tire vulcanizing apparatus. The Doughty Tire Co., assignee of H. J. Doughty—both of Providence, Rhode Island, U. S. A.

THE FRENCH REPUBLIC.

- 487,760. Improvements in hydraulic presses for vulcanization. V. Champigneulle.

MISCELLANEOUS PATENTS. A FRENCH CUSHION WHEEL.

THIS invention covers a vehicle wheel with an annular cushion resembling an ordinary pneumatic tire, arranged between the hub and the solid rubber tire of the wheel. A is the hub, B the pneumatic cushion, and D the rim that supports the solid tire F. Between the tread of the cushion B and the rim D there is loosely placed a metallic ring C. The metal side-disks G and G' are fastened to the hub by bolts H and to the hollow

BANBURY MIXER.

PNEUMATIC CUSHION WHEEL.

rim D by bolts H'. The resilient power necessary between the disks G and G' and the rim D is produced by springs K, the ends of which are fixed to the rim and disks, respectively.

When the wheel turns, the hub carrying the pneumatic cushion and the disks revolves and transmits motion through the springs and the rim to the solid tire. (J. Gonzalo and R. de Dampierre. French patent No. 486,944.)

PROCESS PATENTS. THE UNITED STATES.

- N**O. 1,280,944. Process of manufacturing brushes having bristles set in rubber. T. F. Barry, assignor to Rubber and Celluloid Products Co.—both of Newark, New Jersey. (Original application divided.)
- 1,281,153. Belt making process. C. C. Gates, assignor to The International Rubber Co.—both of Denver, Colorado.

THE DOMINION OF CANADA.

- 185,360. Process for vulcanizing rubber tire-treads to casings. W. B. Burke, Cleveland, Ohio, U. S. A.
- 185,653. Process for repairing punctured pneumatic tire casings. W. M. Rand, Vancouver, British Columbia.

THE UNITED KINGDOM.

- 118,302. Process of vulcanizing india rubber, etc. W. J. Mellersh-Jackson, 28 Southampton Buildings, London. (Morgan & Wright, Jefferson avenue, Detroit, Michigan, U. S. A.)

THE FRENCH REPUBLIC.

- 487,958. Process for impregnating and covering fabrics with balata without using solvents. L. François & Co.

SNOW'S COMPENSATING DENTAL VULCANIZER.

The fact that rubber shrinks in vulcanizing was brought to the attention of the dental profession over forty years ago. It is responsible for many of the mishaps that occur in the construction of artificial dentures, and is the cause of certain defects

which render them unsanitary, and of others which must be remedied by the dentist before the denture is acceptable to his patient. These defects may be obviated by use of the compensating vulcanizer here shown.

It has a flask-closing apparatus by which the flasks can be closed after they are placed in the vulcanizer, and at any time during the vulcanizing process, at the pleasure of the operator. This is done by the gradual pressure of springs which exert a constant force upon the rubber, following it up as it yields, preventing it from drawing away from the teeth or loosening its hold upon the toothpins, or from drawing away from and leaving an unsightly gap under the shoulders under the bicusps and molars.

As the amount of pressure exerted is shown by the index, the operator is enabled to use more or

less, according to the circumstances of the case. As the springs are placed at the ends of the cross-head which actuates the flask-closing mechanism, they are not exposed to steam or moisture, and consequently will not deteriorate. (The Snow Dental Co., 448-50 Niagara street, Buffalo, New York).

COMPENSATING DENTAL
VULCANIZER.

TIRE FACTORY IN FORT WAYNE, INDIANA.

The Fort Wayne Tire & Rubber Co., Fort Wayne, Indiana, has bought a building site in the north part of the city, where it will erect a factory to cost approximately \$30,000, for the manufacture of the "Wayne" tire. The property covers seven city lots and a plot of one and thirty-five-hundredths acres adjoining, or a total of two and one-half acres. It is located immediately west of the Lake Shore railroad tracks and the right of way of the Fort Wayne and Northwestern interurban line. This will be the first tire factory in Fort Wayne. The officers of the company are: L. R. Welker, L. E. Kraft and J. C. Brown, of Fort Wayne, Indiana; N. F. Rhoton, Bluffton, Indiana; O. W. Kuecken, Chicago, Illinois; and B. F. Henline, formerly with banks at Gibbon and Kearney, Nebraska. Mr. Kraft was at one time with the Hartford Tire Co., the United States Tire Co. and the Cadillac Automobile Co. Mr. Brown was previously with the Genoa Rubber Co., and is senior member of Brown & Kraft, makers and distributors of automobile tires and tubes.

CANADIAN NOTES.

IN accordance with its policy of welfare work for employees, the Dominion Rubber System has erected Dalhousie Hall at Port Dalhousie, Ontario, as a home for women and girls employed in the Maple Leaf Rubber Factory. The construction is of brick trimmed with carved stone, with oak doors, while the woodwork throughout is of satin-finished hardwood. The appointments include an electric range, cold storage and refrigerating facilities, steam boiler heating system, electrically driven pumps for supplying both hard and soft water, laundry, etc. The

DALHOUSIE HALL.

basement includes a large recreation room; the ground floor has a main hall with small reception and cloak rooms, the dining-room and kitchen, and the office of the social secretary. The first and second floors are used for tastefully appointed sleeping rooms. Lake Ontario is only a few hundred yards away, and T. H. Rieder, president of the company, has given permission for the erection of suitable bathing houses on his property along the lake shore above the beach for the accommodation of residents of Dalhousie Hall.

The Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, has purchased a tract of land about 25½ acres in area in the neighborhood of the Delorimier race track, at approximately 33 cents a foot, where it expects to commence the erection of a new plant in the early spring to meet the increasing demand for its products.

The recently acquired building adjoining the Toronto branch of the Canadian Consolidated Rubber Co., Limited, comprises over 60,000 square feet of floor space. Among the improvements are show windows for the display of goods, lunch rooms for employees, and rest rooms for women workers.

Hugo Wellein, who was appointed acting treasurer of the Dominion Rubber System, Montreal, Quebec, in October, was elected treasurer at the November meeting of the directors. He succeeds Mr. Bimmore, who has removed to California.

Canada oversubscribed her recent Victory Loan by about \$200,000,000 in excess of the \$500,000,000 objective.

Private W. C. Dies, formerly head of the shipping department of The Dunlop Tire & Rubber Goods Co., Limited, Toronto, Ontario, lost both eyes and his right hand in the battle of Vimy Ridge and was awarded the Military Cross; but as soon as he heard that the subscription list of the Dunlop company was open for the Second Victory Loan he telephoned his personal subscription of \$200.

The Dunlop Tire & Rubber Goods Co., Limited, Toronto, Ontario, subscribed \$1,000,000 to Canada's recent Victory Loan, besides personal subscriptions made by officials and employees of the company. The factory and office staff also won an honor flag for obtaining subscription percentages set by the Victory Loan Committee.

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

New Goods and Specialties.

A SPRAY FOR ACIDS AND OTHER LIQUIDS.

THE hard-rubber spraying attachment shown in the adjoining cut operates with water or other liquid under pressure to produce an extremely fine spray. Owing to the resistance of hard rubber to corrosive action, this sprayer is particularly adapted for atomizing such acids as hydrofluoric, etc. The

HARD-RUBBER SPRAY.

The nozzle consists of the inside and the cap which fits directly on the pipe. The inside part gives the liquid the necessary gyratory action to produce atomization or spray. Clogging is reduced to a minimum because the slots on the inside part are large compared with the nozzle orifice. This nozzle can be cleaned without removal from pipe. The construction can be varied to suit the requirements, and the nozzle works in any position. (Monarch Manufacturing Works, Inc., 3129 Emery street, Philadelphia, Pennsylvania.)

ANOTHER CAP COVER AND CHECKERBOARD.

Although an armistice has been signed, it is probable that there will be officers in uniform for some time to come, so

OFFICER'S RUBBER CAP COVER.

that another type of rubberized cap cover may not be amiss. As the officer is not allowed to carry an umbrella, such cap covers are an essential part of his equipment.

The one shown here is made of high-grade quality

olive-drab rubberized material, silk-finished, light weight, and has an elastic inserted in the edge to facilitate adjustment over the cap. This cover is also made in the regulation khaki color.

While the peace treaty is being prepared, the million boys "over there" will need something to do in spare moments and the familiar game of checkers in a new guise will find a wel-

come, as well as from other players on this side of the water who will appreciate a rubberized checker-board that can be rolled or folded into small space. This particular board is made of rubberized khaki material and is accompanied by 24

RUBBERIZED KHAKE CHECKER BOARD.

wooden checkers of contrasting colors. (Felsenthal Bros. & Co., 512-520 South Fifth avenue, Chicago, Illinois.)

A PATENTED STUD FOR TRACTOR WHEELS.

A new device intended to be secured to the rims of agricultural tractor wheels so as to give them a grip on both soil and road, is the rubber stud of which a cross-section and drawing are shown herewith. Cylindrical

TRACTOR WHEEL STUD OF RUBBER.

pieces of solid rubber are vulcanized onto circular metal pieces having projections in bolt form underneath, thus making possible their application by any blacksmith and also allowing for replacement when worn. The metal base to which the studs are attached is adapted for attachment to rims of different widths. (Dunlop Rubber Co., 14 Regent street, London. United Kingdom patent No. 118,149.)

FOR HOME CANNERS.

Against the time when fruit shall be ripe again and the housewife preparing it for winter use, somebody has devised a new kind of jar-holder, which, while simple in construction, is at the same time efficient. It is made entirely of wood. On

RUBBER-LINED JAR HOLDER.

the base is fastened a wooden block with a curved inner face to conform to the shape of a fruit jar. Opposite this block, attached to a screw, is an adjustable curved jaw by which the jar is held. The jar-

gripping elements are rubber-lined. (W. J. McCallum, Evanston, Illinois.)

COMBINED SUPPORT AND APPLICATOR.

The object of the instrument illustrated in the adjoining drawing is two-fold—to provide a support for protruding piles and, at the same time, an applicator of medicament to piles or hemorrhoids.

The instrument is made of rubber, but when intended for use as a support, is made of harder or less pliable rubber at the base and ball, the neck being of more flexible rubber. The cross-sectional view shows the device as an applicator with a detachable medicament container inserted in the recess at the bottom. The bottom of the container is collapsible so that pressure on it causes portions of the medicated charge to be expressed at predetermined intervals. The containers are to be filled separately at the factory and sealed, thus providing sanitary means of application. The base of the instrument is so shaped as to prevent unintentional pressure on the base of the container. It is claimed for the invention, which has recently been patented, that it can be worn without discomfort or inconvenience. (John T. Landis, Nashville, Tennessee.)

The Great Rubber Surplus.

THE belief that there will be 80,000 tons of surplus rubber in and about the Federated Malay States between the present time and June, 1919, naturally stirs the British planters and plantation shareholders. Personally we are of the opinion that this surplus will be absorbed before that time, and not only that but for the year 1920 so great will the world's rubber business be that manufacturers will be fearful of a shortage. Time will of course prove the truth or falsity of this prophecy.

To the pessimists, or perhaps the clear-sighted, come many remedies. The most popular which has been advanced from various sources is a sort of valorization plan. A writer to one of the London papers advocates a selling association thus:

I am not a selling agent and have no interest in sales, but I would suggest that a great obstacle to any arrangement would be removed by limiting the selling association to a term of five years and agreeing that the companies joining the association should continue existing emoluments to agents during that term. I would suggest a selling association with a capital in £10 shares, the capital to be issued to companies in the proportion of £1 for each cultivated acre. Of the capital £2 per share only to be called in calls of £1 each, the balance to remain as a guarantee. I would suggest an initial capital of £1,000,000, which could be increased as the number of members grew. The association would take delivery of the rubber of its members and either sell it, warehouse it, lend on it, or carry on any other usual business, etc., at ordinary rates. In addition, it should charge 1/4d. per pound, out of which the administration costs would cover any surplus profit accumulating for distribution at the termination of the association. The advantages of such an association would be so great that I am certain that any companies that did not come in at the beginning would later on be eagerly seeking membership. I would suggest that the Committee of Young Producers should lose no time in preparing a scheme and submitting it by circular to the London companies. The London "Statist" suggests a plan analogous to the Australian Zinc Producers' Association, Limited, thus:

The agency companies and administrative groups could vest their rubber selling and crop financing in it, the purchase considerations, as agreed upon, to be payable in debentures, preference or ordinary shares. Warehouses, wharves and other necessary adjuncts to be obtained and the facilities to be expanded as required. Thus would be constituted a considerable portion of the necessary fixed assets and good will of the undertaking on the selling end of the business. Assuming for the purpose of illustration that producers of a full crop-producing capacity of 100,000 tons per year would participate, a common basis for acquiring a share interest would have to be arrived at, say, perhaps 6d. per pound on the annual producing capacity, which roughly represents the funds required to finance production for three months at 2s. per pound. The aggregate sum would be £5,600,000. A company of individuals producing 250,000 pounds per year would take up £6,250 of, say, £1 shares. The corporation would purchase the rubber at the average price ruling for the year, charging a commission on the average price ruling, rising with the average price paid. The better the average price, the higher the commission paid, the greater the benefit to the producers, and the higher the earning power of the corporation. Crops requiring to be financed in excess of the production covered by the actual funds at the corporation's disposal could be covered by bills and bankers' advances.

Whether any of these plans are carried out, certain it is that for a time at least, much plantation rubber must be stored, in fact is being stored. If it were upriver fine or coarse, we would know all about its keeping qualities in storage. But for plantation crepe prepared in a variety of ways, neither planter nor manufacturer has anything but judgment to go on.

Mr. Sidney Morgan of the Research Laboratory in Petaling, Federated Malay States, gives the following as his plan for preparing and storing rubber so that it may not deteriorate:

(1) Correct preparation of the rubber.

(2) Thorough drying of crepe rubber; and thorough drying and smoked curing of smoked sheets.

(3) In the case of crepe rubber it would be advisable to prepare only the thin variety so that drying can be seen to complete.

(4) In the case of smoked sheets they should be marked with a distinct ribbed pattern, preferably of the close-spiral type.

(5) All wooden boxes should be perfectly dry before use. As a regular precaution the wood should be placed in the sun for several days. The use of damp boxes is a frequent source of troubles.

(6) Packed boxes should never be placed on a cement floor. A wooden floor is advised and even then the boxes should rest upon beams or rails so that there is open ventilation between the floor and the bottom of the boxes.

(7) Boxes should be placed with a small space between them in all possible directions, so that the surfaces obtain the maximum ventilation.

(8) The building should be so designed as to permit of all windows being opened without the admission of direct sunlight. This can best be effected by means of verandas all round the building.

(9) If possible the floor of the building should be raised from the ground to the height of a bullock-cart or motor lorry. This will ensure better ventilation; and will facilitate easier handling of boxes from a loading platform.

(10) The building should have the best possible ventilation either by ordinary means (e. g., a good jackroof) or by mechanical devices. It should be a separate building and no moist rubber should be allowed to hang in the upper stories.

(11) Other factors such as the situation of the building, etc., will appeal to anyone who studies the question.

In reviewing all of the above they do not seem wholly sound, nor adequately to cover the ground. As some one has wisely said, the best place to store surplus rubber is in the tree.

As therefore England, France and the United States are planning cooperative farming, and economic growing and distribution of foodstuffs, why not apply the same system to rubber—cooperation?

Tapping carried out with wisdom and fairness would seem to offer a solution.

AMERICAN SOLDIERS LEARNING TO REPAIR TIRES IN THE MODEL FIRESTONE REPAIR SHOP AT AKRON, OHIO

Should be on every rubber man's desk—Crude Rubber and Compounding Ingredients; Rubber Machinery; Polyglot Rubber Trade Directory; Rubber Country, of the Amazon; and What I Saw in the Tropics.

News of the American Rubber Industry.

AN ACTIVE WORKER IN CONNECTION WITH THE WAR INDUSTRIES BOARD.

ONE of the men who is doing most valuable work for the Government, is J. C. Matlack, one of the assistants to Harry T. Dunn, chief of the Rubber and Rubber Goods Section of the War Industries Board. As a young man Mr. Matlack was employed by the Simons Hardware Co., St. Louis, Missouri, rising to be head of the bicycle and accessory department of that concern, after which he left to become eastern sales manager of the A. Fetherstone Co., Chicago, Illinois. On the organization of the American Bicycle Co. he was appointed purchasing agent for the more than sixty factories, and in 1901 was made the company's western sales manager.

J. C. MATLACK.

The following year he resigned and became president of the International Automobile and Vehicle Tire Co., Milltown, New Jersey. When this company was succeeded by the Michelin Tire Co., he was made vice-president and general manager, retaining those offices until 1911, when he joined the newly organized Ajax Rubber Co., New York City, as secretary and general manager. During the six years he was with the Ajax company the value of the business was multiplied many times. Mr. Matlack was elected vice-president of the American Writing Paper Co. in 1917, resigned during the present year, and returned to the rubber business, becoming president and general manager of the Globe Rubber Tire Manufacturing Co., of Trenton, New Jersey.

PERSONAL MENTION.

Frank R. Carroll has been promoted to the district management of The B. F. Goodrich Rubber Co., Akron, Ohio, in San Francisco. He was formerly manager of the Los Angeles branch.

H. L. Hall has been appointed branch manager at 1328 Michigan avenue, Chicago, Illinois, for The Swinehart Tire & Rubber Co., Akron, Ohio. He has been connected with the automobile and bicycle business for a number of years and for the last eight years has had charge of the western territory of the Troy Carriage Sunshade Co., Troy, Ohio, manufacturing automobile specialties.

Lewis E. Klug, formerly with the Victor Tire & Rubber Co., Springfield, Ohio, has been appointed factory superintendent of the Electric Rubber Reclaiming Co., Barberton, Ohio, succeeding J. F. Johnston, resigned.

J. S. Benner, secretary of the Electric Rubber Reclaiming Co., Barberton, Ohio, has been appointed general manager, also.

Garfield List recently succeeded S. S. Poor as district manager of the United States Tire Co., New York City, in Philadelphia, with headquarters at 329 North Broad street.

G. A. Binz, sales manager for the Yarnall-Waring Co., Chestnut Hill, Philadelphia, Pennsylvania, has transferred his headquarters to the company's New York office, at 90 West street.

R. H. Wilson has been appointed assistant to the president of the Walter A. Zelnicker Supply Co., St. Louis, Missouri, dealer in machinery, mill and factory supplies, etc.

E. O. Griffin, well-known in southwestern railroad circles, has been appointed representative of the Walter A. Zelnicker Supply Co., St. Louis, Missouri, at Houston, Texas, succeeding R. H. Wilson.

Ernest Newton, a salesman for the Sterling Tire Corp., Rutherford, New Jersey, in the Hartford, Connecticut, territory, has been appointed manager of the Hartford branch, succeeding W. H. Lacey, now in government service.

Julius Lichtenstein, president of the American Sumatra Tobacco Co., has been elected a director of the Keystone Tire & Rubber Co., New York City.

On and after January 1, 1919, Byron T. Mottinger, E. E., will be associated with the Quaker City Rubber Co., Wisconsin, Philadelphia, Pennsylvania, as chief engineer and master mechanic. He is now general superintendent of power of the Fort Dodge, Des Moines & Southern Railroad, Boone, Iowa.

TRADE NOTES.

The Republic Rubber Corp., Youngstown, Ohio, has acquired the entire assets of The Knight Tire & Rubber Co., Canton, Ohio, and has taken over the operation of the Knight plant. The selling organization of the Knight company will continue indefinitely under that name and the capital stock has been reduced from \$1,500,000 to \$150,000.

The Alling Rubber Co., Danbury, Connecticut, has removed from 264 to 268 Main street, where it has nearly double floor space and better shelving accommodations. The company intends to add new lines. It now deals in rubber goods, automobile tires and supplies.

The plant of the Rubber & Celluloid Products Co., 56 Ferry street, Newark, New Jersey, situated on Wilson avenue of the same city, which was recently destroyed by fire, will be rebuilt at an approximate cost of \$50,000. The new structure will be one and two stories in height, 42 by 390 feet. The officers of the company are: A. Albright, Jr., president; T. B. Denton, vice-president; T. M. Kays, secretary, and C. M. Freeman, treasurer. This concern manufactures the "Rubberbet" brushes.

The Combination Rubber Manufacturing Co., Bloomfield, New Jersey, manufacturer of "Viking" tires and tubes and mechanical rubber goods, at the annual meeting of its stockholders on November 4, elected the following officers: William H. Servis, president; Horace T. Cook, vice-president; Fred L. Conover, treasurer; Frank W. Servis, secretary; Arthur R. Colvin, factory manager, and William A. Robbins, superintendent.

The Denver Rubber Co., 1645 Lawrence street, Denver, Colorado, western distributor for The B. F. Goodrich Rubber Co., Akron, Ohio, has four men—Ferguson, Davis, Cary and Holmes, its entire force of traveling salesmen—in service. The officers of the concern include R. A. Kincaid president and treasurer, and V. C. Wist, secretary. It was established in 1889.

The George W. Eno Rubber Co., Inc., has just moved into its new building at 1159-63 Post street, San Francisco, California, which will be the headquarters for its business north of Tehachapi. R. T. MacMillin, managing director, is in charge of this

territory. The company is the Pacific Coast representative of the Akron Rubber Mold and Machine Co., Akron, Ohio.

Brighton Mills, Passaic, New Jersey, have discontinued their New York office at 257 Fourth avenue, and hereafter will handle all business from their office at Passaic, New Jersey. The officers of the company are: William L. Lyall, president and treasurer; Harry V. R. Scheel, assistant treasurer; Thomas M. Gardner, secretary; and Timothy J. Kelly, superintendent.

The Sterling Tire Co., 234 West 55th street, New York City, has registered with the Secretary of State of New York and received authorization to do business in that State. The concern is a Delaware corporation.

The Owen Tire & Rubber Co. has removed its office from 1900 to 2336 Euclid avenue, Cleveland, Ohio, but correspondence should be directed to the factory at Bedford, Ohio.

The Manhasset Manufacturing Co., Putnam, Connecticut, manufacturer of tire fabrics and yarns, has recently completed a two-and-one-half-story addition, 60 by 60 feet, to its main mill, and will use it for plant extension in the general manufacture of tire duck.

The Eagle Packing & Rubber Co., Inc., 123 Chambers street, New York City, manufacturer of asbestos packings and mechanical rubber goods, has leased the second loft at the above address. H. W. Austin is president of the company and J. E. Paul is superintendent of production.

The rubber substitute and chemical business of the late George F. Lufbery, Jr., at Elizabeth, New Jersey, has been taken over by W. J. Moren, who has been in Mr. Lufbery's employ for the past eleven years. The business will be continued along the same lines as formerly.

The Cameron Machine Co., 51-61 Poplar street, Brooklyn, New York, has opened a new sales office and service station at 503 First National Bank building, Cincinnati, Ohio, in charge of Frank C. Risselt, who is well-known to the rubber trade.

The Guaranteed Tire Service Co., 241 Main street, Dubuque, Iowa, has changed its name to Tire Service Co. It has also discontinued acting as distributor for the Savage Tire Corp., San Diego, California, and is now exclusive branch distributor for the entire line of the Miller Rubber Co., Akron, Ohio, covering northeastern Iowa, southwestern Wisconsin and northwestern Illinois. A large tire-repair plant has been installed, which makes a specialty of retreading.

The Ehmman Tire & Rubber Co., La Salle and 27th streets, Chicago, Illinois, has changed its name to the Inland Rubber Co., which name will be used in all business transactions on and after December 1, 1918.

GOODRICH IN CALIFORNIA.

M. D. Bixby was recently appointed manager of the Los Angeles, California, branch of The B. F. Goodrich Rubber Co., Akron, Ohio, controlling all Southern California and Arizona territory. Mr. Bixby has been with the Goodrich company since 1914 and previous to that time was with the Diamond Rubber Co. in Chicago. He has made the following appointments in his territory: L. E. Nollen, district superintendent of operations; E. G. Ketchum, manager mechanical sales; M. B. McKinsey, manager pneumatic tire sales; E. W. Perry, manager of tire cure sales; G. M. Gay, in charge of service department; J. F. Howard, manager of credit department; B. Schuttre, manager of traffic department, and E. Hegerling, manager of stock department.

PRODUCTION OF RUBBER IN FIJI ISLANDS.

The British Trade Commissioner to New Zealand, who has lately visited the Fiji Islands, reports that rubber cultivation is receiving much attention there, New Zealand farmers having started large plantations on Fiji lands of a suitable nature. Quantities of rubber of a very high grade have already been produced.

DIVIDENDS.

The Ajax Rubber Co., Inc., 1796 Broadway, New York City, has declared its quarterly dividend of \$1.50 per share, payable December 15 to stock of record November 30, 1918.

E. I. du Pont de Nemours & Co., Wilmington, Delaware, declared a dividend of one per cent, payable November 11, for the benefit of the United War Work Campaign, the checks being specially marked and the recommendation made that they be turned over directly to the fund by the recipients.

The General Electric Co., Schenectady, New York, has declared quarterly dividends of \$2 per share and two per cent in common stock at par, both payable January 15, 1919, to stock of record December 7, 1918.

The Mason Tire & Rubber Co., Kent, Ohio, on October 31, declared a six per cent cash dividend, payable at the rate of two per cent on the 20th of February, May, and August, 1919.

BOSTON TO SAN FRANCISCO LINKED BY MOTOR TRUCKS.

Two three-ton motor trucks of The Goodyear Tire & Rubber Co. recently made a successful journey from Boston to San Francisco and return, a distance of 7,763 miles. The freighters left Boston on September 1, with a cargo of airplane tires for the military authorities at San Francisco, and completed the 3,700-mile run in 21 days, allowing a one-day stop at Akron, Ohio. The trucks followed the Old Post Road to New York, then the Lincoln Highway to San Francisco, by way of Philadelphia, Pittsburgh, Akron, Fort Wayne, Cedar Rapids, Omaha, Cheyenne, Salt Lake City, Carson City, Sacramento and Stockton.

From San Francisco the trucks proceeded to Los Angeles, by way of Stockton, Fresno and Bakersfield, and thence over the National Old Trails Route, through the Mojave Desert and Needles, California, to Phoenix, Arizona, where the Goodyear

BOSTON—SAN FRANCISCO FREIGHT TRUCKS.

cotton plantation is located. Here a load of baled cotton was taken on for delivery to the Goodyear Cotton Mills, at Goodyear, Connecticut.

Doubling back to Ash Fork, Arizona, the trucks picked up the National Old Trail and continued on through Flagstaff, Albuquerque, Santa Fe, Las Vegas, Trinidad, Kansas City, St. Louis, Indianapolis, Dayton and Columbus to Akron, and from Akron to Boston over the regular route through Pittsburgh, Philadelphia, and New York.

The trucks were equipped with 44 by 10-inch all-weather cord tires on the rear wheels and 38 by 7-inch, rib-tread tires on the front wheels.

RUBBER PLANTING A FAILURE IN HAWAII.

Rubber planters in Hawaii who some years ago took up Ceara rubber cultivation in vigorous fashion, are being disappointed in their expectations. In fact, a very great part of the plantations has already been abandoned or planted to other crops.

The Editor's Book Table.

NINETEENTH YEAR BOOK, 1918. THE RUBBER ASSOCIATION of America, Inc. 52 Vanderbilt Avenue, New York City. (Paper cover, octavo, 120 pages.)

THIS annual publication follows its predecessors closely in style and contents, giving in well-arranged form lists of officers, directors, standing and special committees, and membership, the constitution and by-laws, and the reports of officers and chairmen of the various committees and trade divisions. There are also included the addresses delivered at the annual dinner last January, as well as half-tone illustrations from photographs taken at various meetings of the association. From the secretary's report we learn that there are 315 firm members and 249 associate members, a larger membership than ever before in the history of the association. The treasurer's report shows the finances to be in excellent condition.

CHEMICAL ENGINEERING CATALOG, THIRD ANNUAL (1918) Edition. The Chemical Catalog Co., Inc., New York. (Cloth, 9 by 12, 836 pages. Price, \$5.)

The third annual edition of this valuable reference work is intended for the use of chemical engineers, buyers and others seeking information on chemical and metallurgical equipment, machinery, chemicals and supplies. It is a collection of condensed catalogs and indexed data compiled by the publishers under the supervision of a special committee representing the American Institute of Chemical Engineers, American Chemical Society and the New York Section of the Society of Chemical Industry. Free distribution of the book is limited to chemical engineers, superintendents, buyers and others in responsible charge in manufacturing establishments, and to chief chemists and to departments of chemistry in universities, colleges and technical schools.

PRACTICAL INSTRUCTION ON ELECTRICAL FIRE HAZARDS. By Thomas Henry Day. The Insurance Institute, Hartford, Connecticut. (Pamphlet, 16mo, 120 pages, illustrated.)

This is a series of lectures given before the Insurance Institute by Mr. Day of the New England Insurance Exchange. It treats of the proper installation and the later inspection of electric wires and appliances, shows the causes of fires through overheating, short-circuiting, electrolysis, grounding of current, etc., and the results of non-compliance with the necessary rules for safe installations. The book contains many diagrams and half-tones from photographs of faulty work and the fires or leaks resulting therefrom.

COMMUNICATIONS OF THE NETHERLAND GOVERNMENT INSTITUTE for Advancing the Rubber Trade and the Rubber Industry. Part VII. By Dr. G. van Ierssen, translated by J. C. van Marcken. International Association for Rubber Cultivation in the Netherlands Indies, Delft, Holland. (Paper covers, 39 pages.)

This is the final instalment of English translations of a Dutch work published in 1916. It consists of chapters on "Porosity of Vulcanized Rubber" and "Remarks on the Nature of the Vulcanization Process." Much valuable information has been made available to the American and English rubber trade through the translation of the original Dutch report of the institute's original investigations on the characteristics of crude rubber, methods for its valuation and the chemical and physical changes induced by vulcanization.

A. S. T. M. STANDARDS, 1918. PUBLISHED BY THE AMERICAN Society for Testing Materials. Philadelphia, Pennsylvania. (Size, 6 by 9 inches, 908 pages. Price \$9.)

This compilation embraces a large number of standard specifications, tests, methods, definitions and recommended practice of interest to engineer and chemist. The specifications cover ferrous and non-ferrous metals, cement, lime, gypsum and clay products

and miscellaneous materials, among which rubber is included. Rubber manufacturers, and rubber chemists will find data of interest in the specifications on cotton rubber-lined rubber hose and air line hose for pneumatic tools; in the tests for cotton rubber-lined hose; standard methods for analysis and test of white pigments; dry red lead; coal; yellow-orange, red and brown pigments containing iron and manganese.

GIDS VOOR BETREKKINGZOEKENDE IN DE CULTURES TER Oostkant van Sumatra. Dr. Ch. F. Haje, Middelburg, Holland. Publisher, J. H. de Bussy, Amsterdam, Holland. (Paper cover, 75 pages, map, 8 full-page illustrations.)

The object of this work is to acquaint young Hollanders intending to seek positions on plantations on the East Coast of Sumatra with their future surroundings and, to a certain extent, with their prospects. After a brief historical review and sketches of Belawan and Medan, a clear summary of the various products and the work connected therewith is given. There is a chapter on Eastern labor, the manner of recruiting, and hints regarding the attitude to be adopted toward coolies of different nationalities. Another chapter deals with the Occidental staff, salaries, promotion, etc., and points out various questions to be considered by married men. The program of the first course in Indology, instituted by the Kolonial Instituut, Amsterdam, recommended to the prospective assistant, completes this useful little book.

NEW TRADE PUBLICATIONS.

IN LINE WITH THE NATION-WIDE MOVEMENT FOR THE CONSERVATION of pneumatic tires, the Miller Rubber Co., Akron, Ohio, has recently issued a new tire repair book designed for the use of the car-owner. It takes up such repairs as can be made at home, but discourages the undertaking of extensive repairs where crude workmanship may ruin the tire. The actual experience of the Miller tire department has been drawn upon for the information contained in the publication. Illustrations are included, a series of practical hints and suggestions concerning tire trouble, and a comprehensive discussion of rims and the application of tires on different types of rims.

* * *

"INDUSTRIAL ATHLETICS," IS THE NAME OF THE EIGHT-PAGE monthly now being issued by the recently formed American Industrial Athletic Association, mentioned in our issue of September 1, 1918. An account of the first athletic meet, with illustrations, is given, as well as articles on the value of athletics, women in war work, how sports help industrial production, etc. The organization is strictly limited in its membership to amateur performers. Extracts from the constitution and a membership application blank complete the first number of the publication. Its address is Box 277, Goodrich Station, Akron, Ohio.

* * *

"REGULATIONS GOVERNING THE PRODUCTION OF RUBBER Products," Issue No. 1, October 1, 1918, that were superseded by Issue No. 2, November 1, 1918, have both been issued in pamphlet form by The War Service Committee of the Rubber Industry and were published in full in THE INDIA RUBBER WORLD, November 1, 1918.

* * *

"THE GRAVE LOG" IS THE TITLE OF THE HOUSE-ORGAN OF W. R. Grace & Co., Hanover Square, New York City, bankers, importers of crude rubber, and other products. The publication is printed monthly on first-class stock, in pamphlet form, seven by ten inches, with paper covers, and contains 48 pages in English and Spanish. The first number was issued in April and contained

pictures of the 194 employees of the company who had at that time entered government service. Later issues have contained portraits of officers of the company and the new line of steamers operating in combined passenger and freight service to ports on the west coast of South America, the first to run to those ports under the Stars and Stripes.

THE ALTENBURG TIRE EQUIPMENT CO., DAVENPORT, IOWA, HAS issued an attractive 40-page illustrated catalog of tire repair equipment for all requirements. The Altenburg process of re-treading is featured with detailed description and numerous illustrations.

THE OBITUARY RECORD.

SUCCESSFUL AND RESPECTED RUBBER RECLAIMER.

ABRAMHAM MARCUS, treasurer and general manager of the Somerset Rubber Reclaiming Works, East Millstone, New Jersey, passed away on November 1, 1918. He was born in Dorpat, Russia, September 30, 1883, the son of the late

Samuel and Sarah Marcus, with whom he came to this country in 1896.

He worked in a shirt factory and at the expiration of four years had saved enough money to go into the junk business at Perth Amboy, New Jersey, where he remained for seven years, finally going to New Brunswick, New Jersey, where he became a partner in the New Brunswick Iron & Metal Co., which business he was interested in at the time of his death.

In 1910 he founded a corporation under the name of **Somerset Rubber Reclaiming Works**, with a factory at East Millstone, New

ABRAHAM MARCUS.

Jersey, of which corporation he was treasurer and general manager from the time of its origin until his demise. Under his management this concern has become one of the most progressive of its kind in the United States.

During his régime there were never any labor troubles in the factory, as all the employees were contented with their lot, since they found in their general manager a man to work for who understood their position, wishes and desires. It was this human element in Mr. Marcus that made him respected by all with whom he came in contact.

As a philanthropist he had not an equal for a man of his means, and the many unmentioned deeds of charity performed by him are a touching testimonial to his exceptional kindness. There is hardly an organization or institution of a charitable or semi-charitable character that does not count him among its most generous patrons.

He was president of the New Brunswick Lodge, I. O. B. A.; chairman of the Religious Committee and president of the Sons and Daughters of Zion; a former vice-president of the Congregation of Ahavas; trustee of the Congregation of Anshe Emes; national director of the Rabbinical College of New York; former vice-chancellor of the Knights of Pythias; member of New Brunswick Lodge, B. P. O. E.; life member of the American Red Cross Society; member of the United States Chamber of Commerce, and a member of The Rubber Association of America, Inc.

He was ever preeminently identified with every war relief movement, and his mite was always cheerfully and ungrudgingly given whenever he was called upon.

Mr. Marcus was known throughout the rubber industry of the

United States and Canada, and the trade has lost a successful and respected member.

MAKER OF RUBBER SUBSTITUTES AND CHEMICALS.

George F. Lufbery, Jr., the well-known manufacturer of rubber substitutes and chemicals for the rubber trade, died at his home in Elizabeth, New Jersey, last month, aged 43 years.

Though born in France, Mr. Lufbery was of American parentage, and his father, the late George F. Lufbery, was a pioneer in the manufacture of rubber substitutes, the firm being known as Lufbery & Chardonier, with factories at Chauny, France. When a youth the son spent a winter at a Florida resort, and while there decided to complete his education in the native land of his parents, entering and later graduating from the Indiana Normal College at Valparaiso. Entering

GEORGE F. LUFBERY, JR.

business, he developed a good trade in the products of his father's factory in France, which establishment, however, was totally destroyed during the German invasion. Nothing daunted, he equipped a factory at Elizabeth, New Jersey, and continued the manufacture of rubber substitutes and chemicals for the rubber trade.

Mr. Lufbery was intensely loyal and active in the various war relief campaigns. He was also a member of the local State Militia Reserve. Indeed, it was the performance of his duties as such that cost him his life. At the time of the disastrous South Amboy munition plant explosion he reported for duty at the armory and there contracted a cold that resulted in pneumonia.

Mr. Lufbery was treasurer of the Society for the Study and Prevention of Tuberculosis; a member of the Young Men's Christian Association; a trustee of the Park Methodist-Episcopal Church, and president of the Forum connected with that congregation. The Chamber of Commerce of Elizabeth, New Jersey, adopted resolutions expressing regret at the loss of so valued a citizen.

He is survived by his widow; also by a brother and sister residing in Paris, France, and a step-mother living in Lawrenceville, New Jersey. He was also a first cousin of the late Major Raoul Gervais Lufbery, the American ace, whose death in the French aviation service was recorded in THE INDIA RUBBER WORLD of June 1, 1918.

SUMMER TOUR OF THE AKRON BOY SCOUTS.

THE RUBBER TRADE IN AKRON.

By a Special Correspondent.

IN November, The B. F. Goodrich Co., Akron, Ohio, made the following announcement:

During the past year the many unusual demands, due largely to war conditions, including the patriotic subscriptions to Liberty Loans and War Savings Stamps and the generous contributions to the various war activity funds, have created a situation which this company has already recognized in its payment of wages to its employees on the factory payroll and which it feels equally bound to recognize in its payment for services to salaried employees.

Each salaried employee will, therefore, receive on December 1, 1918, additional compensation for services rendered and to be rendered, equal to 25 per cent of the total salary paid to each such employee during the year 1918.

Since the beginning of the war, Goodrich employees have "stuck on the job" as well as contributed 3,800 men to the colors. The action of the company in voluntarily giving the bonus announced means the distribution of at least \$2,000,000, and it applies not only to salaried employees in the Akron factory, but also to those in the field force.

Many employees are planning to use the bonus to pay up the balance due on their Liberty Bonds, some are going to put it in the bank, some are going to purchase Goodrich stock; but all are going to do something worth while with it, without question.

* * *

The B. F. Goodrich Co., Akron, has made the following appointments: C. H. Wheeler, formerly chief supervisor of production, in charge of all pneumatic tire production; I. R. Renner, formerly chief supervisor of construction, in charge of pneumatic tire construction and quality; J. T. Johnson, Jr., manager of experimental tire department.

Misses Ruth and Mary Sterley, two of the Goodrich nurses whose pictures appeared in *THE INDIA RUBBER WORLD* November 1, 1918, are now in France.

Miss Mary Stevenson, another Goodrich nurse, is planning to enter Red Cross service.

New training quarters for athletes of The B. F. Goodrich Co., Akron, were opened late in October, adjoining the rooms occupied by the Goodrich fire department. Athletic equipment of all kinds has been installed. The rooms are open to all Goodrich men who secure a permit from Director Connelly for the use of them.

* * *

The Mason Tire & Rubber Co., Kent, has been making large shipments of rubberized raincoats to the Government on contracts placed about two months ago. Five weeks after the contract was signed, the company had taken over a large unused plant, equipped it completely, and commenced deliveries at the rate of 2,000 coats per week. This number has since been increased. The raincoat plant will be maintained regardless of war work.

* * *

The Swinehart Tire & Rubber Co., Akron, is adding to its plant a two-story, reinforced-concrete brick-front building, 50 by 167 feet, to be used for vulcanizing and storage purposes.

* * *

The Electric Rubber Reclaiming Co., Barberton, is now manufacturing rubber heels and fiber soles, rubber stair-treads, door mats and matting, and sheet packing, besides its regular line of products.

* * *

The Columbian Tire & Rubber Co., Columbiana, has increased its capitalization from \$300,000 to \$800,000 comprising \$500,000 common stock and \$300,000 preferred.

The Williams Foundry & Machine Co., Akron, manufacturer of tire-building and repair equipment, including all kinds of the necessary tools, presses, and vulcanizers, has just completed its new office building, besides other recent additions to its plant.

PLANT OF WILLIAMS FOUNDRY & MACHINE CO.

The company was reorganized a year ago and since that time has greatly increased its manufacturing space, facilities, and volume of business. It completely equips tire-building factories as well as making the requisite tools and machinery.

* * *

John C. Reich has been appointed to fill the position formerly occupied by Robert E. Lee, now in government service, as superintendent of labor for the Firestone Tire & Rubber Co., Firestone Park, Akron. Mr. Reich comes from the Western Electric Co., Chicago, Illinois, where he gave considerable study to industrial development, health insurance, labor conditions, and kindred subjects. His training has particularly fitted him for his present position.

* * *

Miss Laura Sweeney, of the factory hospital of The Goodyear Tire & Rubber Co., is the first Goodyear nurse to be assigned to an overseas unit of the United States Army Medical Corps. She recently left Akron for New York City, to prepare for her trip to the war zone.

Miss Gladys Halford, another Goodyear nurse, recently left for California, there to await the sailing of the Red Cross vessel on which she expects to go to Siberia.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

THE abrupt cessation of hostilities abroad and the probable ending of the war have brought about some marked changes in rubber manufacturing establishments where war materials were being made. As a rule the Government has shown a disposition to be quite fair in regard to contracts, and while expressing a desire that the manufacturers should accept cancellations, is endeavoring to have them do so without detriment to the industries, or any loss on material in process of manufacture. The production of such articles as gas-masks, however, the need of which, it is hoped, will nevermore be realized, has been abruptly stopped, and in them rubber tubing and elastic web were used, so the cancellation affects factories making those parts. The clothing makers are curtailing production, and possibly have ceased cutting new fabrics, though finishing all garments which were in progress. The tire manufacturers are allowed an increased production for civilian use. The footwear manufacturers are enabled to furnish boots for their regular trade, an accomplishment not possible while the Government demanded their full boot output for the soldiers.

* * *

When A. M. Paul purchased the business of the Davidson Rubber Co. several years ago, the catalog of its products made a goodly volume, so great was the number and variety of the goods manufactured. To-day a little 24-page pamphlet, small enough to go in an ordinary-size letter envelope, is sufficient to picture, describe and price the lines of goods now produced. Concentration and specialization take the place of unlimited

variety, and with the manufacture of a small number of items commanding a large sale, the business has been so systematized that the income has shown a remarkably large increase, though the assortment is reduced to 20 per cent of the previous output. As an example of the concentration it may be mentioned that where formerly more than forty varieties of water bottles and fountain syringes were listed, now only two styles of each are made, only two styles of bulb syringes, and two kinds of nipples, of one color only. The same simplification applies to tobacco pouches, ice caps, etc., and the house has discontinued special markings and individual labels for jobbing or retail customers. The business dates back to 1857, and the present structure, (or part of it), was built 50 years ago, yet when one goes through the factory he finds all the machinery and equipment of the latest, another point which makes for efficiency, and this, having its influence on the quality of the output, is an added cause for an increase, within a comparatively short time, of over 50 per cent in the annual business done by this company.

* * *

It will be remembered that C. J. Bailey, the proprietor of the longest established rubber store in this city, died last April. The business has recently been incorporated as the C. J. Bailey Co., with a capital of \$50,000. The officers are H. E. Bailey,

M. S. LAWRENCE.

president; Leah Bailey, clerk, and M. S. Lawrence, treasurer and general manager. The two first are the son and daughter of the late Mr. Bailey. Mr. Lawrence has been associated with Mr. Bailey's business for more than two score years, having started with him in the dry goods business in Lynn, occupying an important position when Mr. Bailey established the lace business in Boston, and was for two years a lace buyer. When Mr. Bailey's rubber brushes and tires gained prominence,

Mr. Lawrence opened a branch house in Montreal, Quebec, and later, for two years managed the London, England, and Paris, France, houses of the concern, with residence in the former city. Of late years he has been Mr. Bailey's right-hand man in the Boston store, and the decision of the heirs to place him in charge of the business is a wise and proper one.

* * *

The Clark Rubber Manufacturing Co. reports a constantly increasing business in its specialty of rubber heels, and while, in the last few months it has been difficult to fill all the orders coming in, the prospect is for a better source of labor supply, which will enable the company to keep up with the demands of the trade.

* * *

The "Hood Arrow" is a neat, newsy publication issued semi-monthly by the service department of the Hood Rubber Co., Watertown, and sold to the employees at one cent per copy. The November 15th issue contains a list of all the employees of that company who have entered the Army or Navy, with each individual's latest address, thus giving their fellow workers the opportunity to send Christmas greetings. It is a long list, nearly nine pages, though the last page gives only the names and departments of those who had not sent their addresses. An interesting war-time item, headed "How War Changes Destinies," reads as follows:

A stranger in the person of Arved Alex secured employment here several months ago. He was assigned to the Tube Room, Tire Bldg. Arved was a bright blond man of 28, educated for 10 years in the best colleges in Europe. He spoke five languages and had a large account in a Somerville bank. Recently Arved caught the "flu," pneumonia developed and he

died. His uncle came here to see Mr. Dwyer and explained why the young man was working here. "Arved," he said, "was superintendent of a rubber concern as large if not larger than the Hood; but when Germany tried to induct him into Service he fled the country by way of Siberia, whence he came to America."

* * *

The Boston Rubber Shoe Co. has been making over 4,000 pairs of hip rubber boots a day for the United States Government, and because of this has been unable to fill civilian orders for its regular trade. In this respect it is in the same position as all other rubber footwear manufacturers. On account of the armistice and its expected culmination in restoring peace in Europe, it is more than probable that present boot orders will be cancelled, and thus the boot makers will be available for filling the civilian demand.

* * *

The L. J. Mutty Co. has increased its trade in automobile top fabrics and upholstery fabric remarkably in the last few years. It is furnishing large amounts of its top fabric to the Government to equip its tractors. The foreign business of the concern has increased 1,000 per cent since the war started, and extends not only to Europe, but to South America, the Philippines, Malaysia and Australia. This in part is caused by the government regulations that only one in four automobiles exported may be furnished with a top. This resulted in a big demand abroad for top fabrics, which demand this house has specially catered to, with the result that the "Dridek" trademark of the company's goods is becoming well-known in foreign countries.

* * *

Fred T. Ryder, of the Rinex Sole Division of the United States Rubber Co., has been covering some of his territory by automobile. Last month he had some strenuous experiences with muddy roads. Once he was stalled for several hours on a short stretch of unpaved highway on the State road between Brunswick and Gardiner, Maine. Yet even at that, he can hardly appreciate the mud about which his son writes in describing his experiences in the 26th Division "over there."

* * *

The new mill about to be erected by Everlastik, Inc., in Chelsea, was intended primarily for the manufacture of non-elastic webbing for war purposes. However, with the conclusion of the war it is believed that the demand for the goods of this enterprising concern will be so increased that the new mill will be fully occupied on its completion.

* * *

The newly organized Citizens National Bank of Boston, which will open for business early this month, has a strong directorate including several prominent business men. The rubber business is represented by Captain Francis H. Appleton, of F. H. Appleton & Son, Inc., and Abraham Sydeman, of the Plymouth Rubber Co.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

ALL manufacturing establishments throughout Rhode Island were closed on "Liberty Day," Monday, November 11, in celebration of the surrender of Germany and the signing of the armistice. As soon as the whistles and bells sounded the prearranged code about 3 o'clock in the morning, houses were ablaze with lights, thousands of persons swarmed to the streets, parading, cheering, singing and waving flags.

At Bristol the operatives from the National India Rubber Co. and the Narragansett Rubber Co. made a solid phalanx of more than 3,500 in the parade and in Woonsocket the employees of the Alice Mill joined in the demonstration. In

Providence thousands of men, women and girls from the Revere Rubber Co., the Davol Rubber Co., Bourn Rubber Co., Glendale Elastic Fabric Co., Mechanical Fabric Co. and the Valley street plant of the United States Rubber Co. swelled the ranks of the paraders.

* * *

Following the announcement of the signing of the armistice there was a general cessation of overtime activities in the rubber manufacturing establishments of the State, and while the management of the various plants refused to discuss the situation, it was generally understood that a halt had been called on all government goods and contracts, at least temporarily. It was stated, however, that, irrespective of future employment on these contracts, the regular lines were so far behind normal conditions of the market that there was sufficient work on hand or in sight to keep the mills running to capacity for many months to come.

At the Davol Rubber Co. the manufacture of gas masks was discontinued November 13, but of the 45 men and women that were employed on this work, less than half a dozen were laid off. All of the women were given work in other departments of the plant. When the manufacture of the masks was started, very few new employes were taken on, most of those assigned to this work being withdrawn from other departments. The Revere Rubber Co. was also engaged in making gas-masks.

* * *

Colonel Samuel P. Colt, of the United States Rubber Co., is a member and president of the Rhode Island Limit Men, an association composed of firms and individuals of this State who have purchased \$1,000 worth (maturity value) of War Savings Stamps, and he is making a special effort to secure the enrollment of at least 2,000 members before the close of the year. Already there is a total membership of more than 1,400. Among the members are the Bourn Rubber Co., Mechanical Fabric Co., Davol Rubber Co., and the Revere Rubber Co., all of this city; National India Rubber Co. and Narragansett Rubber Co., of Bristol, and Woonsocket Rubber Co., of Woonsocket.

* * *

To the United War Work Fund the Woonsocket Rubber Co. contributed \$10,000, credit for \$6,000 of which was given to the Alice Mill, at Woonsocket, while the other \$4,000 goes to Massachusetts, where the other plants of the concern are located. The Glendale Elastic Fabric Co. donated \$2,000 to the fund, of which \$1,500 was credited to Massachusetts and \$500 to this State.

* * *

The developments that have followed the taking over of the site of the old Alco Co.'s plant on Valley street by the United States Rubber Co., and combining with the adjoining plant of the Revere Rubber Co., have been rapid and extensive. The combined properties now operated under the direction of the Revere Co. have a total area of 909,687 square feet, of which 444,854 square feet are included in the newly acquired Alco site. Additional machinery and facilities are being introduced. In the old Alco plant, foundations for forty new vulcanizers of large size are being laid and a number of large-size mixing machines installed. A large oil tank will be erected at the old Revere plant, as fuel oil will be used more extensively in the operations of these factories.

* * *

The Ninigret Mills Co. is the style of a new corporation chartered last month under the laws of Rhode Island with a capital stock of \$50,000. The incorporators are Frederick E. Fowler, Charles Perry and Charles S. Fowler, all of Westerly. The new concern will manufacture fabric for auto tires and will conduct business at the Arnold Mill, in Canal street, Westerly.

Among the extensive improvements and alterations that have recently been under way at the plant of the Bourn Rubber Co., Warren street, Providence, was the changing of the walls and foundations of the boiler house preparatory to enlarging the boiler equipment. Plans have just been completed for a storage building to be erected on Warren street. It is to be of brick, of mill construction, one story high, 60 by 90 feet, with concrete flooring and gravel roof.

* * *

At the National India Rubber Co.'s plant at Bristol alterations, extensions and improvements continue. During the past month extra heavy foundations have been put in at the large new storage building which was erected about a year ago.

* * *

John H. Mott, for 34 years foreman of the packing department of the National India Rubber Co., Bristol, died on November 17, in his 69th year. He was born in Bristol and made the first rubber shoes at the Byfield Rubber Co., Bristol, now the Narragansett Rubber Co., when that plant commenced operations.

* * *

John Anderson, foreman of the shipping department of the insulated wire division of the National India Rubber Co., Bristol, died on October 28, of double pneumonia. He was 32 years of age and a native of Scotland. He had been in the employ of the National company for a number of years.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

THE rubber industries of Trenton, through both employes and company officials, contributed liberally to the United War Work Fund. All the Trenton plants were placed on the 100 per cent list. The Acme, Hamilton, Home, United & Globe, Thermoid, Whitehead Brothers, Joseph Stokes, Ajax, Empire, Delion, Essex and the Joseph Stokes Rubber companies each contributed \$1,000. George R. Cook, president of the Acme Rubber Manufacturing Co., gave \$1,500; Charles E. Stokes, vice-president of the Home Rubber Co., \$500; Louis P. Destribats, manager of the Ajax Rubber Co., Inc., \$200; while General C. Edward Murray, former head of the Empire Rubber & Tire Co., gave \$800. Charles E. Stokes, of the Home Rubber Co., was chairman of the industrial section of the last war drive. Speakers visited all the rubber concerns and concerts were given at each plant to arouse interest in the drive.

* * *

All the Trenton rubber manufacturers were well represented in the peace celebration parade and the majority of them had floats in the line of march. The Essex Rubber Co. had the largest turnout and the girl employes marched in blue bloomers and blue waists. The United & Globe Cos. blew their big factory whistle from 3:30 o'clock in the morning until late in the afternoon.

* * *

The Trenton rubber concerns are now well supplied with coal for the coming winter. John S. Broughton, the Mercer County fuel administrator, recently secured permission from the Government to allow the rubber concerns not only to secure a good supply for the winter months but also to store coal for future use.

* * *

The Thermoid Rubber Co., Trenton, has nearly completed a two-story steel and brick semi-fireproof building which is intended to take care of increased business in several departments and provide increased storage space. The new structure is a continuation of the building erected several years ago and will give the company, when completed, a two-story factory approximately 280 feet in length and 70 feet wide.

The Crescent Insulated Wire & Cable Co., Inc., Trenton, was recently one of several wire companies awarded a contract by the Government for Signal Corps wire for use overseas.

Here are pictured two popular rubber men of Trenton who are so well-known in the trade that to name them would seem almost unnecessary. They were evidently enjoying a holiday at some popular resort, judging by their happy expression, particularly that of the British officer, who is doubtless thinking of the enthusiasm his address created at a recent war-work meeting.

F. E. FULPER AND CAPTAIN BUCKLETON

Young Oakley has been in the aviation service for some time.

Milton Cohn, private secretary to John S. Broughton, president of the United & Globe Rubber Manufacturing Cos., and now connected with a base hospital supply in France, was surprised, while driving an ambulance across a battlefield, to pick up a piece of fire hose made by the Globe company. On the hose were the words, "United & Globe Fire Hose, manufactured by the United & Globe Rubber Manufacturing Companies, Trenton, N. J." The United & Globe ship their products to many foreign countries. Cohn is 23 years old and formerly lived in Brooklyn, New York. Several years ago he was given a position in the United & Globe's New York office. Because of his efficient work he was transferred to the main office at Trenton and made private secretary to President Broughton. He has been in France nearly a year.

UNITED & GLOBE FIRE HOSE FOUND ON A FRENCH BATTLEFIELD.

A recent fire badly damaged the drying room at the United & Globe plant. The blaze started from an overheated pipe.

The Delion Tire & Rubber Co. contemplates the erection of additions and alterations costing \$75,000.

The Truck Tire Sales & Service Co. has been incorporated with \$50,000 capital and has opened headquarters at 42 Barnes street, Trenton. John M. Goodridge, Edith Goodridge and Thomas N. Balderston are the incorporators. Mr. Balderston has made a study of the manufacture of solid tires and has been at the Philadelphia headquarters of the United States Tire Co. for some time familiarizing himself with the details of the business. The company is now installing a new ten-ton hydraulic press, and will handle only United States solid and truck tires.

The Semple Rubber Co., Trenton, has leased for a term of years the large three-story factory building of the Japanese Silk Garment Co., situated on Lambertson street. The building will be used by the Semple company in connection with its factory on Murray street for the manufacture of automobile tubes. The company has outgrown the Murray street plant.

Charles H. Cook, treasurer of the Hamilton Rubber Manufacturing Co., sustained lacerations and contusions of the head when an automobile in which he was riding recently crashed into a pole near his home on West State street. The machine was driven by his daughter.

RUBBER-SET AND RUBBER CUSHION BRUSHES.

In the manufacture of rubber-set brushes the tufts are partly secured by the application of unvulcanized rubber before being placed in the bands or ferrules, and owing to the hardness of rubber after vulcanization, it is necessary to drill holes in that portion of the brush in the band or ferrule before the brush can be nailed. The process in making rubber cushion brushes is to rout and undercut the blocks. The bristles are sifted by an agitator through the holes of a piece of rubber somewhat larger than the recess of a block. The ends of the bristles protruding through the rubber are ironed down, and liquid rubber is placed over the ironed ends and vulcanized. The rubber containing the tufts is inserted in the back of the brush, in the end of which a hole is bored to allow the passage of air under the rubber to give the cushion effect. Hair brushes are made by this process both in the United States and in England.

Brushes have always been specifically provided for in the tariff acts at ad valorem rates of duty varying from 7½ per cent in the acts of 1789 and 1790 to 40 per cent ad valorem in most of the acts of the last half century. The rate in the Act of 1913, now in force, is 35 per cent. The provision applies alike to toilet and paint brushes. ("The Brush Industry," Tariff Information Series, No. 8. United States Tariff Commission, Washington, D. C.)

REAPPRAISEMENTS.

RAINCOATS.—The foreign market value of raincoats, imported from the Associated British Clothing Manufacturers of Leeds, England, is advanced in a reappraisal decision handed down on November 19 by Judge Howell, of the Board of General Appraisers. The raincoats in question, exported from England on July 1, 1913, and entered at this port on August 1, 1918, were valued by the importers on the invoice of 41s. each. The official decision of the general appraiser, fixing the value at 43s. each, reads as follows:

Double breasted raincoats cotton, C. 1023, entered at 41s.; re-appraised at 43s. each.

RUBBER BOOTS TO BE PLENTIFUL SOON.

Relief from the acute shortage of rubber boots for civilian use in this country is forecast by the action of the Government in asking that all manufacturers of rubber boots and shoes consider the cancellation of present contracts for rubber boots which expire December 31.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

At the time of writing, the constitution of the committee which is to advise the Ministry of Munitions as to what steps if any are advisable with regard to the government control of rubber, has not been made public, but it is understood that the Rubber Manufacturers' Association will be represented on it. Meanwhile, though there is a good deal of ferment in plantation companies, prices are keeping up well, as there is little disposition on the part of the public to dispose of shares. In the trade the general feeling is that when peace comes the price of rubber and also of shares will go up because so many countries are almost denuded of rubber goods. At the same time the huge war demand will of course fall off, and with the further increase in the output which is to be expected, prices will then fall again. The opinion is expressed that the trade will not be able to absorb all the rubber produced in a few years. A lot of rubber is now being used in place of leather, not because people prefer rubber soles to leather, but because of the scarcity and high price of leather. When leather comes down to more natural prices the rubber sole will go, to a large extent, unless the makers cut their present large profits. At the recent exhibition of footwear and leather substitutes in London, Sir Edward Fenton, chief inspector of boots for the Army Clothing Department, said that during July and August 200,000 pairs of boots had been made in this country with leather substitutes, though such substitutes were not used for army boots. That there is nothing like leather still seems to sway the official mind. The trade generally remains very busy and, unlike some others, it has no apprehension at all as to its immediate future if the peace rumors which are prevalent as I write come to an early maturity, such is the congested state of order books for civilian requirements.

Trade has continued much on what are now normal lines, though a feature has been the demand for waterproofs, owing to the incessant rain of the later part of the summer, a business in which advanced prices have proved no deterrent. In civilian business the sales to men always exceed those to women; now it is the reverse as so many women are engaged in work of one sort or another, and moreover they have more money to spend on themselves. With the present high prices of textiles the waterproof, whether rubber or merely rain-proof, is likely to remain at a high price for some time.

DETERMINATION OF THE STATE OF CURE.

In a recent paper entitled "Comparative Methods for Determining the State of Cure of Rubber," embodying work done for the Rubber Growers' Association and communicated to the "Journal of the Society of Chemical Industry" for August 31, 1918, Dr. H. P. Stevens raises an important point with regard to the testing of rubber samples. Specifications usually state that the rubber goods must stand certain physical as well as chemical tests in order to show the state of vulcanization, and Stevens shows that whereas the chemical test for combined sulphur is independent of the age of the sample, the physical tests, particularly the load supported per unit of cross-sectional area at a given elongation and *vice versa*, depend upon the age and external condition of the rubber. Comparable results are obtainable, therefore, only when the samples are tested at a fixed period subsequent to vulcanization. Further, the temperature to which the samples have been exposed also affect the results, as Stevens proved by testing at both summer and winter temperatures. In the specifications with which I am familiar there is no reference to the above causes of discrepancy and nothing definite is known as to the age of the samples being tested.

It is not uncommon for a sample to be submitted a day or two after manufacture, and if this is approved of, the manufacturer of the bulk quantity is then proceeded with. It may take some months to complete the order so that a sample taken on delivery may be as many months old as the original sample was days. Moreover, summer may have given place to winter, or *vice versa*. It certainly seems, then, that Stevens' paper should be taken to heart by those responsible for physical tests made in connection with important contracts. As has been said, the chemical tests are not affected in the same way and Stevens' main objection to these seems to be the time they occupy. Many will agree with him on this point. I remember, when Weber's book was first published, hearing a Teutonic rubber chemist if I may be allowed to say so—remark that life was too short for Weber's methods. I doubt, however, if Weber mentioned extracting rubber for a week as Stevens does in his painstaking and methodical work.

GOVERNMENT SUPPRESSION OF RUBBER IMPORTS.

On October 11 the trade received notice that a committee of the Ministry of Munitions with Sir Clarendon Hyde as chairman, had been formed to regulate the import and supply of raw rubber to manufacturers. The notice was also sent to reclaimers, as all scrap and waste rubber are included in the regulations. Under the various salvage schemes the authorities have recognized that the scrap rubber business has become quite a big thing and that the reclaimer is now considered a much more important personage than in days of yore.

JOURNALISTS ON THE TRAMP.

It will not be news to American readers to hear that a party of American journalists have been doing Great Britain. More, I believe, are to come, though whether the Editor of THE INDIA RUBBER WORLD will be among them I have no information. British journalists have also been on the tramp, and a special article contributed by one of them to a prominent paper in the North of England contains references to Pirelli's works which are of more than passing interest. After saying that Italy has not drawn much upon women for industrial war work, the writer remarks that Pirelli's great rubber works have always had many women but even to-day the proportion to men is not much higher. The women work nine hours on an average and get from 7 to 9 lire (\$1.35 to \$1.74) a day. In only one room were women seen in men's clothes, and this had always been the case. Further on the writer says: "At Pirelli's rubber factories we beheld in their stately chapel-like laboratories the production of an electric spark at a tension of 600,000 volts—a high act of modern scientific ritual that cannot be performed anywhere else in the world. It appears that they can actually go up to 800,000 volts."

GUAYULE.

The illustrated article on the guayule industry in the issue of THE INDIA RUBBER WORLD for July 1, 1918, was very interesting. No doubt many besides myself were surprised by the scientific developments which have taken place. Those who introduced guayule rubber to the English manufacturer found that their path was not all roses, as a good deal of prejudice existed. I remember the extensive exhibit at the Second London Rubber Exhibition, under theegis of H. van der Linde. This attracted a good deal of attention because of the rubber-manufacturing machinery installed. The sample of guayule which I took away with me seems to be in much the same condition

to-day as at first; it is certainly not oxidized like certain other brands of extracted rubbers on offer at that date. The guayule sample was well-rubbed with sulphur on account of its tackiness, the resin content being about twelve per cent. I do not know whether sulphur is going to be generally used, but it has obvious disadvantages. Perhaps the tackiness will be removed in the future so as to render any such addition unnecessary.

I asked a rubber manufacturer the other day as to his opinion of guayule. He said it was a long time since he had heard the name, but when it was introduced to the English trade he made numerous trials with it. The results, he said, were carefully recorded in note-books which could be referred to if occasion arose. What had been particularly against it was the variation in the quality lost in washing. He had bought it, he said, at prices varying from 36 to 84 cents per pound and there was an impression in the trade that the sellers were getting what they could in an endeavor to induce the manufacturers to arrive at its real, relative commercial value.

PERSONAL AND TRADE NOTES.

At Dublin, on September 17, Dr. Dunlop, the inventor of the pneumatic tire, was summoned for using a motor car contrary to the regulations. The doctor, who is 79 years of age, pleaded necessity and was fined the mitigated penalty of \$2.40, the magistrate characterizing him as a public benefactor.

Dr. E. M. Muspratt, owing to advancing age, has resigned the chairmanship of British Insulated and Helsby Cable Co., Limited, and is succeeded in that position by James Taylor. Dr. Muspratt will still retain a seat on the board, to which Alexander Roger, of London, has been added. Dr. Muspratt was primarily a chemical manufacturer, and a director of the United Alkali Co., of which concern his son, Max Muspratt, is now chairman, while James Taylor has been head of the Helsby Cable Works for many years.

R. T. Byrne, who presided at the annual meeting of the England & Birmingham Rubber Co., in September, announces that the company has now acquired all of the shares of the Mitcham Rubber Co., near London, and that in order to finance its various extensions it has decided to issue the balance of \$50,000 preference shares, only £18,500 having so far been issued.

E. Mather, who has been for the last two or three years president of the Amalgamated Society of India Rubber Cable and Asbestos Workers, has resigned this position on appointment as manager of Messrs. Mandelberg's new proofing works, Manchester.

With regard to my recent reference to the changes at the Revolt Co.'s works, Manchester, I may add that Mr. Reed has now given up the management which he assumed temporarily, the post now being held by Mr. Crozier, managing director.

Lord Colwyn, chairman of Charles Macintosh & Co., Limited, is one of a committee of three peers appointed to inquire into the formation and financial arrangements of the British Cellulose and Chemical Manufacturing Co. Severe strictures have been made in responsible quarters about this large new concern, which was primarily established about three years ago for the manufacture of airplane dope from cellulose acetate, a body which has been made for some years by the Dreyfus process.

HOT-WATER BOTTLES FOR MUFF HAND-WARMERS IN CHINA.

The deluge of orders from China for rubber hot-water bottles has at last been explained. All China is not suffering from indigestion nor an epidemic of Spanish influenza, but it seems that instead of carrying the old-fashioned charcoal hand-warmers in their muffs, the Chinese girls are using rubber hot-water bottles and this custom has become a style or fad. Hot-water bottles are the more popular in that thus used in a muff held close to the person they impart considerable heat to the body while warming the hands.

MISCELLANEOUS FOREIGN NOTES.

TRAVELERS' TREATY SOON GOES INTO EFFECT.

THE treaty designed to protect the rights and coordinate the activities of commercial travelers in all the countries of the Western Hemisphere, has been ratified by a sufficient number of countries to go into effect. This will be a most important step forward to promote the trade of the United States in Central and South America.

The new treaty will consolidate all the many annoying provincial and local taxes, licenses, and charges placed on commercial travelers into a single, uniform Federal tax. This will enable the trade representative to go anywhere in the country to which he is sent and solicit business in person or by correspondence for the period of one year.

The samples carried by the traveler are privileged to enter at the ports of each country without being subject to duties where they have no commercial value and may be exported within a period of six months, the commercial traveler furnishing a bond for strict compliance with the law.

AMERICAN ELECTRICAL EQUIPMENT FOR SWITZERLAND.

"La Revue de Lausanne" states that the United States has offered to make a loan of 750,000,000 francs to Switzerland in order to electrify the railways. Switzerland thus would become independent of German coal.

RUBBER SHEETING USED IN DISINFECTING WOUNDED GERMANS.

Under the title "Berlin Days," Neville Taylor Gherardi writes interestingly in "The Saturday Evening Post" regarding experiences in both Germany and Austria during the time her husband was naval attaché at Berlin. Her observations in an Austrian hospital disclose one of the many uses of rubber goods in connection with the war, about which little has been written. The narrative reads:

Nowadays in Europe one talks quite naturally about the little animals that walk on the men in the trenches. I saw in the hospital in Vienna how they kept them out. All patients are received in a big iron building, where all their garments are removed and the patients scrubbed with disinfectants, the badly wounded are put on stretched rubber instead of into tubs to disinfect them, then wrapped in sheets and taken into the hospital. The clothes are then passed through a high-temperature room, which kills all life in them, after which they are repaired, cleaned and ready for the man again when he is well. There are buildings large enough to disinfect a whole train at one time after it gets back from the Russian front.

That was before the present shortage of rubber within the Central Empires became acute. Henceforth this humane treatment will in many instances have to be effected by less convenient means, and the ever-increasing shortage of rubber surgical goods can but result in a considerably increased mortality in enemy hospitals.

NIPPLES FOR FEEDING BOTTLES.

As has been stated in a previous issue of THE INDIA RUBBER WORLD, feeding bottle nipples are extremely difficult to obtain in Germany. Reworked rubber is now usually employed in making them and a firm at Munich uses a rubber substitute called Sterilin, which is claimed to be free from smell and stickiness. Apparently the rubber substitute usually produced by the industrious German chemist is not quite the perfect article it claims to be.

TIRES FROM TOADSTOOLS.

The scarcity of cork in Germany led to an investigation of possible substitutes that is reported to have resulted in the invention by Wohlfart and Sachovitz of a process by which toadstools are converted into an elastic substance, suitable for making stoppers for bottles, rings for preserve jars and in making automobile tires, etc.

Rubber Planting Notes.

RUBBER PLANTING IN BRITISH MALAYA.

L. LEWTON-BRAIN, Director of Agriculture, Federated Malay States, publishes a series of statistical tables dealing with the rubber planting industry in the Malay Peninsula. These statistics show that in spite of the crisis through which the industry is passing (in common with most other industries), there was an addition of 93,950 acres to the planted area during the last year, bringing the total up to 1,045,820 acres, of which 621,622 acres are in the Federated Malay States. These figures refer only to estates of 100 acres and over. The statistics for the various portions of British Malaya are as follows:

	1916.	1917.
Federated Malay States.....	551,959	621,622
Straits Settlements.....	145,139	153,189
Ipohore.....	153,691	162,375
Kelantan and Kelah.....	98,436	105,484
Trengganu.....	2,645	3,150
Acres.....	951,870	1,045,820

The following interesting comparative table is given of estates of over 100 acres in extent:

	1916.	1917.
Number of estates.....	1,475	1,634
Area in possession.....	1,857,157	1,908,993
Planted in rubber.....	951,870	1,045,820
Pre-living.....	543,556	632,929
Newly planted.....	118,801	93,950

In addition to the above, an official approximation is made of the planted acreage of holdings of less than 100 acres each in the Federated Malay States. This is given at 271,862 acres, of which 109,535 acres are producing.

The number of laborers employed on the larger estates amounted to 352,552, of whom 228,850 were employed in the Federated Malay States. The labor force is made up as follows:

Tamils.....	200,451
Chinese.....	98,393
Malays.....	29,822
Javanese.....	14,044
Others.....	4,532

One of the tables gives the rubber crop for 1917 as 82,319 tons, as compared with 67,677 tons in 1916 and 1,580 tons in 1908.

RUBBER IN THE FRENCH AFRICAN COLONIES.

It is estimated that the average annual production of rubber in the French Colonies of Western Africa amounts to 2,000 tons, while French Equatorial Africa produces some 3,000 tons. There are considerable stocks now available at all shipping points in France's African Colonies.

FRENCH COLONIAL RUBBER.

The Belgian Minister of Colonies has delegated Dr. G. Van Pelt a government official of the Belgian Congo, to work for a while at the Colonial Institute, Marseilles, France. Dr. Van Pelt's labors in the past have been in researches at the rubber laboratory at Delft, Holland, and as technical director of one of the largest plantations in Sumatra. The Marseilles Colonial Institute proposes to study, with the doctor's help, the measures that can be taken to improve the preparation of African rubber for the market. The "Cashiers Colonialx," of October 18, 1918, issued by the Marseilles Colonial Institute, contains a report by Dr. Van Pelt on the subject, and a report by E. Baillaud, general secretary of the Colonial Institute, on the steps being taken to provide France with the rubber now needed. An account is given of the work being done by the bureau created in French Guiana to prevent frauds in the rubber exported from there.

Reports by the Planters' Syndicate of Indo-China and by the Professional Rubber Syndicate, which is assisting the French Ministry of Armaments in the organization of production, are also published in this issue.

BRAZILIAN RUBBER IN FRANCE.

The close harmony in which French rubber manufacturers are working to obtain the quantities of rubber they need for their factories has been well illustrated by their method of handling a recent shipment of eight hundred tons of Pará which the Bank of Brazil had shipped to France. The French Professional Rubber Syndicate, a voluntary organization, controlled the distribution of this rubber, which had been sold by the Brazilian Government to the French Government. For the present, all sales of rubber from Brazil for consumption in France are strictly governmental transactions, and it is thought that this system will continue as long as official regulation of payment and ocean freight rates remain in force.

AN END TO RUBBER FRAUDS IN FRENCH GUINEA.

Formerly, rubber brokers at Liverpool and Bordeaux were continually complaining of the impurities in rubber from French Guinea, such as leaves, bark, twigs, earth, sand and gravel. One particular lot of *Landolphia owariensis* rubber was shown on analysis, to contain:

	Per cent.
Humidity.....	0.15
Mineral matter.....	4.55
Resinous matter soluble in acetone.....	0.70
Vegetable impurities.....	6.10
Pure rubber.....	76.62
	100.00

If this analysis had applied to the whole annual production of the colony of 1,500 tons, there would have been about 375 tons of impurities. Government control (before shipment) is now so strict that the analysis of a recently exported lot gave the following results:

	Per cent.
Mineral matter.....	0.90
Humidity and substances soluble in acetone.....	4.00
Pure rubber.....	95.10
	100.00

Shipments now average less than five per cent impurities.

RUBBER-PLANTING INDUSTRY IN SOUTH INDIA.

At the annual meeting of the United Planters Association of Southern India, at Madras, in the latter part of August, 1918, the chairman described conditions in the rubber industry as follows:

Last year I remarked on the rapid fall in rubber price, which I thought might possibly be due to increase in home stocks, but hoped for a recovery later in the year. Rubber has been removed from the priority list, we are told, owing to currency difficulties. Freight is not available for shipment to the United Kingdom, thus cutting South Indian rubber out of the home market, and with America further restricting license for import into United States for August and September, prices are still falling, and the latest home price shows about 2s. per pound, practically the lowest on record. There is, at the present moment, large quantities of South Indian rubber awaiting shipment at West Coast ports. Rubber, unlike tea and coffee, has no local market to fall back on, and so financial aid is necessary and urgent. It is due to British enterprise and capital that Great Britain holds the commanding position she does as regards rubber supplies, an indispensable war requirement to her and her allies. Planters fully recognize that the best must be made of sea tonnage, and that the "best" can mean the carrying of only absolutely necessary war requirements and food commodities. I think those rubber companies

and estates that are in need of urgent financial aid have every right to expect and claim government aid and help in the same way as it has been given to the coffee planters by means of Taccavi loans.—(Report of the American Consul, Madras, India.)

BRITISH NORTH BORNEO RUBBER.

Despite war conditions the rubber trade is reported to have enjoyed undiminished prosperity in 1917. During that year the exports amounted to 5,470,900 pounds, valued at \$5,439,123 Straits dollars (Straits dollar, 56.7 cents, United States currency). This is an increase of 26 per cent over the total for 1916. The growth of the rubber industry in this region during the last 25 years is demonstrated by the fact that in 1892 the total exports of rubber amounted to \$59,253, and consisted entirely of wild sars.

Available figures for the first quarter of 1918, however, show a decrease over those for the same period of 1917—1,197,310 pounds against 1,370,321 pounds.

VIEWS ON RUBBER CROP RESTRICTION.

The uncertainty of being able to ship rubber, added to the limited American imports, is forcing to the front the question of restricting crops. It appears that, before the American action became known or was even dreamed of, many large companies had reduced their output from 20 to 30 per cent. Certain authorities suggest that events in Malaya should be carefully observed, while in the meantime the question of how to conduct eventual restrictions should be considered. The utmost economy in production is recommended. If conditions become worse, it is proposed to request the government to postpone the collection of certain taxes from such companies as are hard hit.

USE OF HYDROMETERS ON RUBBER ESTATES.

J. C. Hartiens, chemical engineer of the experimental station at Malang, Java, publishes in Bulletin No. 23, "Mededeelingen van het Proefstation Malang," an extended report on the use of the latex hydrometers known as the metrolac and the latexometer for determining the caoutchouc contents of rubber latex on plantations. The author summarizes the results of his investigations as follows:

The relation between specific gravity and rubber content of latex is very much influenced by the tapping system and probably by many other factors. Latexes showing the same rubber content may vary a great deal in composition of the serum and *vice versa*. Eaton's table showing the relation between specific gravity and rubber content of the latex cannot be considered reliable for general use. A limited number of latexes will show the relation indicated in the table, but no practical results can be expected from the use of hydrometers. This assumption was demonstrated experimentally by the author who remarks in conclusion that very often no reading with the instruments is obtainable on account of the thick or viscous nature of the latex, air bubbles, etc., and in many cases only dubious reading is obtained, caused by minute curdling in the latex. If good readings are possible, the corresponding rubber content very often shows great differences from the actual content.

The errors made in trial coagulation are always smaller than those made in using the instruments, even after correction. In consequence the author does not recommend the use of such instruments as metrolacs and latexometers and states that trial coagulation is still the best way to get reliable result.

RAILWAY TO DEVELOP PAPUAN INDUSTRIES.

The construction of a light railway, 18 miles in length, to connect Port Moresby, Papua, with the Laloki River, to serve a copper mining enterprise is being considered. This same line, it is claimed, will also be useful to several plantations, including rubber estates. The plan had already been decided upon before the war, but was temporarily abandoned owing to the subsequent situation in Europe.

HOPEFUL OUTLOOK FOR RUBBER PRODUCERS.

WHILE admitting that the war has been a serious trial to rubber producers, the "Financial Times" emphasizes that it has brought out certain features which promise prosperity in the near future, one of the chief of which is that proof has been afforded that synthetic rubber is not a commercial possibility.

During four years the pick of German chemists have been working to make synthetic rubber at no matter what cost. All their experiments in doing so to produce small quantities of a material mixed with certain proportions of natural and reclaimed rubber, makes an unsatisfactory substitute. The only real success achieved in this direction, in fact, is a great improvement in the process of reclaiming and remaking waste rubber, which might be useful in preventing rubber from going too high, but would have little effect so long as the natural product was available at anything like a reasonable price.

The war has resulted in the discovery of some new uses for rubber which are likely to prove of considerable importance in the future. Chief among these is the manufacture of rubber composite soles for boots, resorted to at first owing simply to the general shortage of leather. These soles have since fully proved their value, and are in great demand.

There will be a demand for rubber both in Great Britain and in the United States as soon as the war is over, and to a lesser extent in France and Italy. To this must be added the requirements which will be required in restock Belgium, Germany and Holland, which are practically denuded of rubber, while the high prices which Germany has for a long time been paying may be assumed that there is a great lack of rubber in all the neutral countries bordering upon the Central European zone.

When the demands to be met at once there would undoubtedly be a glut of rubber to go around, as stocks are by no means large at present. In America supplies were recently calculated at about four months' normal consumption and can hardly be expected to rise in this country they are believed to be smaller still. There is probably some accumulation in the East, where companies have kept their output at the factories rather than accept the very poor prices recently offered. . . . but this will not in any case be sufficiently large to have any great effect. If the industry were left to itself, therefore, and buyers had to compete against each other, we might easily see rubber for a time forced up to the extravagant level it touched in 1910, or even beyond. This prospect appears, however, to have been already foreseen by the British Government and to be the real reason for the appointment of a controller, whose first action has been to issue a warning that a maximum price may have to be fixed. It seems a little hard that an industry which was left severely alone to cope with the difficulties occasioned by the war should be promptly put under restraint when conditions take a turn in its favor, but a wild scramble for all the available supplies, with Germany—who has the greatest—outbidding everyone else, would raise the post-war economic problem too promptly and acutely, and would not be of real benefit in the long run.

The percentage of increase in the area under cultivation reached its highest point in 1911, but it was not until four years later that the expansion in the world's production culminated. Since 1915 the trend of the world has been downward, and in the next four years the annual growth will be smaller year by year, the shrinkage being considerable by the drop in the percentage of new area added. In the various arid other sources of supply, the output from Brazil, 240,000 tons for the last six years remained fairly constant at about 280,000 tons per annum, and there is little reason to expect any increase from this source, while it is possible that there may be a further diminution unless a higher level of prices is established. The same applies to the output from Africa and other sources of wild rubber, which have also kept fairly steady during the last five years at between 12,000 and 13,000 tons per annum. The plantation industry in the Middle East is therefore likely to remain the sole source from which increased supplies can be obtained and must tend more and more to dominate the crude rubber market as a whole.

The prospects for the industry generally appear, therefore, very hopeful for a period of at least ten years. At the end of that time it is possible that the increase of new plantations will have overtaken consumption, but in any such future crisis it will be the latexcomers who will have to bear the brunt of the consequent fall in price, while hardly any limit can be placed on the possible extension of the use of rubber.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED SEPTEMBER 10, 1918.¹

NO. 1,278,762. Breast pump with rubber bulb. O. O. R. Schwidetzky, Hadbrook Heights, assignor to Hecton, Dickinson & Co., Rubberford—both in New Jersey.

ISSUED SEPTEMBER 17, 1918.

1,278,822. Tire rim. J. B. Atkins, assignor to The Goodyear Tire & Rubber Co.—both of Akron, Ohio.

1,278,944. Surgical instrument with parts of both hard and soft rubber. J. T. Landis, Nashville, Tennessee.

1,279,001. Inner tube for pneumatic tires. C. R. Rawdon and J. H. Heitmann—both of St. Louis, Missouri.

1,279,006. Bath spray. W. Rose, Brooklyn, New York.

1,279,068. Combined airplane and balloon. C. J. Yavensky, Weyburn, Sask., Canada.

1,279,166. Resilient heel pad. S. Schulhoff, Trenton, New Jersey.

1,279,228. Inner tube for automobile tires. G. C. Berryman, assignor to 45/100 to C. A. Jones—both of Los Angeles, California.

1,279,242. Substitute for leather and method of manufacture. G. H. Bruce, New York City.

1,279,265. Resilient cushioned wheel. H. B. Coats, Crawfordsville, Indiana.

1,279,301. Means for repairing tire casings. E. K. Dull, Chicago, Illinois.

1,279,402. Tire mounting for vehicle wheels. D. Moriarty, New Orleans, Louisiana.

1,279,444. Wind-shield cleaner. F. H. Robertson, Cleveland, O.

1,279,467. Pneumatic mattress. A. I. Smith, New York City.

ISSUED SEPTEMBER 24, 1918.

1,279,601. Fabric and rubber belt. W. W. Spadone, Brooklyn, assignor to The Gotta Percha & Rubber Manufacturing Co., New York City—both in New York.

1,279,629. Demountable tire-rim holder. W. A. Yarger, Akron, assignor of one-half to H. W. Cowgill, Canton—both in Ohio.

1,279,651. Hot-water-bottle stopper. A. S. Campbell, Medford, Massachusetts. (Original application divided.)

1,279,694. Cushion tire. L. Hofmeister, Milwaukee, Wisconsin.

1,279,718. Rubber-coated cord. S. G. Lewis, Greensburg, Pennsylvania.

1,279,719. Tennis racket with rubber-coated wire-wound stringing. S. G. Lewis, Greensburg, Pennsylvania.

1,279,720. Tennis racket with stringing of rubber-coated vegetable fiber. S. G. Lewis, Greensburg, Pennsylvania.

1,279,764. Legging of elastic webbing, with non-elastic ends. P. J. Savage, New York City.

1,279,821. Fountain pen. C. L. Aragon, Reno, Nevada.

1,279,836. Tire casing. A. S. Burdick, assignor to Burdick Tire & Rubber Co.—both of Chicago, Illinois.

1,279,855. Rubber glove with thicker thumb and forefinger and ribs across inner side. J. D. Garvey, Chicago, Illinois.

1,279,924. Golf-training device. C. F. Smith, White Plains, New York.

1,279,925. Pneumatic cue. E. B. Smith, Chicago, Illinois.

1,279,926. Shaving-brush massage attachment. J. Smith, Jr., Phillipsburg, New Jersey.

1,279,936. Inflated ball. R. H. Taylor, Rochester, New York.

1,280,086. Armored tire. H. G. Robbins, Los Angeles, California.

ISSUED OCTOBER 1, 1918.

1,280,145. Demountable tire-rim. W. N. Booth, assignor to Kelsey Wheel Co., Inc.—both of Detroit, Michigan.

1,280,149. Cork-lined rubber boot. G. D. Breck, Cleveland, Ohio, assignee of W. J. Merrett, Pittsburgh, Pennsylvania.

1,280,170. Inner-grooved rubber hose and method of manufacture. N. D. Crawford, Elizabeth, New Jersey, assignor to New York Belt and Packing Co., New York City.

1,280,176. Tire rim. F. L. Darling, Long Beach, California.

1,280,184. Garment supporter. I. Dow, assignor of one-half to E. L. Allen—both of Burlington, Vermont.

1,280,197. Imitation-leather shoe with rubber upper, and method of manufacture. A. G. Emery, New York City, assignor to The Goodyear's Metallic Rubber Shoe Co., Naugatuck, Connecticut.

1,280,220. Cushion wheel. I. Hayman, Los Angeles, California.

1,280,247. Button loop for garment supporters. C. P. Kuehn, assignor to A. Stein & Co.—both of Chicago, Illinois.

1,280,363. Rubber paving for roads, etc. G. Anderson, London, England.

1,280,382. Non-skid tire tread. O. Braunwarth, New York City.

1,280,421. Lined waterproof mittens. H. J. Diem, assignor of one-half to Sanford Narrow Fabric Co.—both of New York City.

ISSUED OCTOBER 8, 1918.

1,280,692. Paper-cup holder with elastic rim-engaging device. C. Errett, New York City, assignor to Public Service Cup Co., Brooklyn—both in New York.

1,280,808. Pneumatic tire. D. F. Morgan, assignor to Hofmann-Morgan Rubber Co.—both of Chicago, Illinois.

1,280,836. Adjustable shoe-heel with rubber cushion. S. Quevedo, Havana, Cuba.

1,280,957. Rubber composition substitute for shoe-soles and method of manufacture. G. H. Bruce, Brooklyn, New York.

1,281,110. Garment supporter. B. H. White, Chicago, Illinois.

1,281,134. Fountain pen with separate attachable filling reservoir, etc. J. L. Clarke, Leamington Spa, England; D. E. and R. A. Clarke and C. S. Raymond-Barker, executors of said J. L. Clarke, deceased.

1,281,194. Self-filling fountain pen. F. H. Mooney, Chicago, Illinois, assignor to The Conklin Pen Manufacturing Co., Toledo, Ohio.

1,281,211. Respirator. E. D. Rogers, Oakdale, Louisiana.

1,281,226. Rubber and fabric composition shoe sole. J. J. Solomon, Oberlin, Ohio.

THE DOMINION OF CANADA.

PUBLISHED JULY 31, 1918.

185,288. Demountable tire-rim. C. R. Tizzard, Humber Bay, Ontario.

185,328. Resilient tire. The Runyan Cushion Wheel Co., assignee of A. L. Runyan—both of Omaha, Nebraska, U. S. A.

185,329. Resilient wheel. The Runyan Cushion Wheel Co., assignee of A. L. Runyan—both of Omaha, Nebraska, U. S. A.

185,473. Resilient tire. R. Blake, London, England.

185,608. Electrical cable. H. W. Fisher, Huguenot Park, Staten Island, New York, U. S. A.

185,639. Tire valve. H. F. Miller, Russellville, Nebraska, U. S. A.

185,735. Artificial car drum. E. Baum, Philadelphia, Pennsylvania, U. S. A.

185,744. Resilient tire. L. E. Clawson, San Francisco, California, U. S. A.

185,837. Cushion tire. J. T. Trotter, New York City, U. S. A.

THE UNITED KINGDOM.

PUBLISHED OCTOBER 9, 1918.

118,054. Rubber-covered rollers. F. Redway & Co., and J. Muskett, Cheltenham street, Peulden, Manchester.

118,118. Self-filling fountain pen. F. Riesenberger, Schoolship "Newport," care of Postmaster, New York City, U. S. A. (Not yet accepted.)

118,130. Point protectors for fountain pens. R. Fallois, Dungen, London.

118,149. Rubber-studded metal tire for tractors, etc. Dunlop Rubber Co., 14, Regent street, London, and C. Macbeth, Para Mills, Aston, Birmingham.

118,176. Collapsible gas-containers for motor vehicles. United Automobile Services Limited, Great Eastern Garage, Lowestoft, and J. C. Jolly, Cockton Hill, Bishop Auckland, Durham.

PUBLISHED OCTOBER 16, 1918.

118,327. Inflatable and deflatable gas-containers for motor vehicles. G. P. Ottino, 33 Chichester Road, Kilburn, London.

PUBLISHED OCTOBER 23, 1918.

118,447. Fountain pen. G. Dalton, 21 Norman Road, Canterbury, Kent.

118,472. Improvements in kite balloons. Aeronautical Instrument Co., and G. Brewer, 33 Chancery Lane, London.

118,474. Improvements in kite balloons. Aeronautical Instrument Co., and G. Brewer, 33 Chancery Lane, London.

118,500. Rubber tension cords for deadening landings-socks of airplanes. A. F. Hawksley, Fairhaven, Lytham, Lancashire.

118,507. Spring bulb formed integrally with nozzle. W. W. Jessup, 44 Bromfield street, Boston, Massachusetts, U. S. A.

118,523. Self-filling fountain pen. H. W. Horne, 27 Rose street, Edinburgh.

118,554. Rubber ring for artificial legs. E. Paoletti, 25 Corso dei Tintori, Florence, Italy.

118,571. Rubber buffers for joints for artificial limbs. E. Smith, 124 St. Stephen's Green, West, Dublin.

PUBLISHED OCTOBER 30, 1918.

118,641. Tire valve. H. P. Kraft, 219 Godwin avenue, Ridgewood, New Jersey, U. S. A. (Not yet accepted.)

118,745. Stocking suspenders. A. J. D'Ostrop, Key West, Monroe, Florida, U. S. A.

THE FRENCH REPUBLIC.

PATENTS ISSUED (WITH DATES OF APPLICATION).

487,592. (April 2, 1917.) Improvements in pneumatic shock absorbers for airplanes. E. Kuper.

487,599. (November 15, 1917.) Improvements in temporary or permanent supports for solid tires of vehicles. B. Lee and S. H. Lee.

487,696. (November 20, 1917.) Armored pneumatic tire. J. E. Dyart.

487,709. (November 21, 1917.) Pneumatic tire for vehicle wheels. W. D. McArthur.

487,794. (November 28, 1917.) Improvements in elastic fabrics. P. L. Josseland.

¹ For other patents under this date, see THE INDIA RUBBER WORLD, November 1, 1918.

- 487,943. (September 15, 1917.) Method of making heels and soles for shoes. Ch. Planchamp.
 487,870. (November 1, 1917.) Taps for crutches and canes. C. Lynde and P. J. Juch.
 487,871. (November 1, 1917.) Taps for crutches and canes. C. Lynde and P. J. Juch.

TRADE MARKS. THE UNITED STATES.

- N^{O.} 73,433. The word **MONOPOLIST** above a conventional bowl-shaped silhouette—brake linings and friction facings. The Asbestos and Rubber Works of America, New York City.
 63,024. The word **STELLA** beneath a circle within which is a star having the characters P and KC on either side of the top point and the letter M between the two bottom ones—rubber goods or goods incorporating rubber, namely, aprons for paper mills and all kinds of business concentrators. Franchi & C., Milan, Italy.
 56,259. Conventional silhouette bearing the monogram W. T. Co.—hot water bottles and bags, douche bags, syringes, invalid cushions, and ice bags. Whittall Tatum Co., New York City.
 107,893. The word **DIRECTORY**—stylographic and fountain pens, etc. Hinks, Wells & Co., Birmingham, England.
 108,505. The word **LIBERTY** beside a representative of the figure of liberty holding aloft a tire—rubber tires. Liberty Tire & Rubber Co., Green Bay, Wisconsin.
 110,577. Silhouette of Ajax rolling a tire—pneumatic-tire accessories, patching patches, blow-out patches, hook-on boots, reinforcers, flapping flaps, rubber and fabric valve-bases, cementless tube-patches, and oval inner-tube patches. Ajax Rubber Co., Inc., Milbrook, New York.
 111,844. The word **APACHE**—self-vulcanizing tires. M. J. Cagle, San Francisco, California.
 112,103. Silhouette of a star—billiard and pocket-billiard balls. The Brunswick-Balke-Collender Co., Chicago, Illinois.
 112,532. The word **LABELOS**—pure cut sheet india rubber, india rubber bottle stoppers, sheets, and mats. The Leyland & Birmingham Rubber Co., Limited, Leyland, England.

THE DOMINION OF CANADA.

 23,650. The word **WOLVAST**—surgical bandages and bandaging material. Reid Brothers, Seattle, Washington, and San Francisco, California, U. S. A.
 23,677. The word **KOCNUK**—general. Rubberset Co., Limited, Toronto, Ontario.
 23,681. Representation of a shield bearing the word **EFFICIENCY** and the monogram R. B.—hot-water bottles, ice bags, inflatable invalid cushions, rubber syringes, etc. Reid Brothers, Seattle, Washington, and San Francisco, California, U. S. A.
 23,707. The letters **H. T. S.**—rubber shoe heels and rubber goods of all kinds. W. Jeffries, Beamsville, and H. C. Jeffries, Toronto—both in Ontario.

ASBESTOS IN THE PHILIPPINES.

A number of years ago reports were received in Manila to the effect that there were deposits of asbestos in the province of Ilocos Norte, and in 1906 Dr. W. D. Smith, geologist of the Bureau of Science, made a technical reconnaissance and reported that evidence was plentiful of the existence of considerable quantities of asbestos at a place called Dugon-Dugon.

A corporation, to be known as the Dugon-Dugon Co., is now being formed, which will continue to give special attention to opening up the asbestos deposits and making this material available for market. Its property is located near Laoag, Ilocos Norte, about two and one-half miles inland from the sea on a stream that is navigable for small craft.—("Manila Merchants' Association Review.")

WHAT TEAM WORK AND EMULATION ACCOMPLISH.

AT the Elmira, Ontario, plant of the Dominion Rubber System, the spirit of team work has been invoked to speed up production. As the success of such a campaign depends

upon definite individual knowledge of the collective results, a great clock was erected showing the daily production of this factory in pairs of footwear. Watching the advancing hand has stimulated such enthusiasm that in a little more than three months production has been increased beyond 2,000 pairs a day, a very commendable record.

The Miller Rubber Co., Akron, Ohio, has found a very comprehensive way to foster enthusiasm and speed up production, with results that are most satisfactory to all concerned.

The plan is both individually and collectively stimulative and

hinges upon emulation, which has been said to be the mainspring of efficiency. A bonus for the best individual records and com-

petition between departments have resulted in remarkably high quality and huge quantity of product. A series of percentages has been arranged and the workmen are penalized a certain number of points for tardiness, absence, blemished articles and less than the average standard of quantity. At the end of each month prizes are awarded for the following records:

100 per cent....	\$10.00
95 per cent....	7.50
90 per cent....	5.00

TEAM WORK.

In addition to these individual rewards, the total average department records are posted regularly each month on special bulletin boards to stimulate departmental pride. These bulletins are jealously watched and a keen, friendly rivalry exists. So productive was this plan in the expenditure of more concentrated energy that even the change of schedule from a nine to an eight-hour day was made at piece-work rates with great increase of earnings to the operatives and correspondingly augmented production. Thus it is proved again that work that means certain, direct, personal benefit is entered into with all the zest of a thrilling game.

GOODYEAR INCREASES COTTON ACREAGE.

Pleased with the results of its 1918 campaign, the largest grower of Egyptian cotton in America, the Goodyear company, is already buying more land to put into this high priced staple. This concern has 12,000 acres of the silky cotton in the Salt River Valley in Arizona, and next year will plant 2,000 acres additional. The crop this year is above normal, it is declared, and a small army of Mexicans is at work picking it.

Review of the Crude Rubber Market.

Copyright, 1918.

NEW YORK.

THE somnolence of the market has ceased, the drowsy feeling which afflicted buyers and sellers until November 11, has vanished. In the first place, the Government permits the importation of 7,500 tons over and above the 25,000 tons allowed for the present period, besides which many expect a further increase in the quantities that may be imported after January 1, some even hope for an early abolition of all import restrictions. At the same time it may be well remembered that next year, lack of shipping may have more to do with the total volume of imports than any probable Government restrictions. Sellers are now asking almost as high prices as the maximum fixed by the Government, and buyers who would not buy at lower figures a few weeks ago are showing considerable interest in spite of the higher quotations.

"The Dutch East Indies Government has stopped the export of rubber, on October 8, 1918," says the "Straits Budget," from which we also learn that a new department of the Dutch Foreign Office has been established to unify economic and foreign policy and especially to renew economic relations with the belligerents.

PLANTATIONS.—Allocated rubber was quoted on November 12 at 51 cents for Latex and 49 cents for Ribs; April-June shipments were quoted at 53 cents for Latex and 52 cents for Ribs. Free rubber prices were, on November 26, 60 cents for Latex and 59 cents for Ribs.

PARAS.—Quotations, with the upward tendency continuing strongly, are: Upriver fine, 66 to 68 cents (a month ago 56 to 58 cents); Upriver coarse, 38 to 40 cents (a month ago 30 to 32 cents); Upper cauchó ball, 38 to 40 cents (a month ago 30 to 32 cents); Cametá, 26 to 28 cents (a month ago 21 to 22 cents).

CENTRALS.—Fractional changes only, untouched by the upward swing.

NEW YORK SPOT QUOTATIONS.

Following are the New York spot quotations, one year ago, and allocation and free rubber prices on November 25. Government option prices, c. i. f. New York, are given in the last column.

PLANTATION HEVEA—

*Rubber Association of America nomenclature.

RECLAIMED RUBBER.

Dullness has characterized the November market for reclaimed rubber, a condition that has ruled since the armistice, in all markets for rubber supplies. Buyers have apparently decided to await the Government's final policy with regard to raw materials and manufactured products. The release of an additional 7,500 tons of rubber imports and the removal and modification of restrictions in the manufacture of certain rubber products is an indication that the Government will soon relieve the industry of all restriction. Prices have not changed materially.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert B. Beers, broker in crude rubber and commercial paper, No. 3 William street, New York, advises as follows:

During November the demand for commercial paper has been light, due largely to the recent drive for the Liberty Loan and the United War Work Campaign, and the demand for paper has been principally from out-of-town banks, the best rubber makers going at 6 to 6 1/2 per cent, and those not so well known 6 1/2 to 7 per cent. From now on the prospect of improving demand and somewhat lower rates, as the money market should be easier.

THE MARKET FOR RUBBER SCRAP.

Copyright, 1918.

NEW YORK.

THE tendency is upward, at least in some lines. The fact that makers of auto tires under six inches can now make seventy-five per cent of their former output, instead of the fifty per cent to which they have been limited for some time, is expected to have an influence on scrap prices. Shipping facilities, it is thought, will be somewhat better, which will improve the general demand.

BOOTS AND SHOES.—An increase in the movement is noticeable at, say, around, 8 $\frac{1}{4}$ cents, while really good lots are worth 9 cents, c. i. f. mills.

INNER TUBES.—A very light demand with prices practically unchanged.

MECHANICALS.—As dull as ever, prices the same.

TIRES.—B white tires are selling at 5 $\frac{1}{4}$ and even 6 cents. Mixed tires cannot be had now for less than 5 $\frac{1}{4}$ cents.

THE MARKET FOR COTTON AND OTHER FABRICS.

Copyright, 1918.

NEW YORK.

DUE to the signing of the armistice, to the decision of the committee not to fix prices, and to the Government's forbidding domestic and foreign short selling there have been violent fluctuations during the past month in the New York cotton market. On October 30, middling uplands was 30.75 cents, on November 25, it was 29.75 cents.

SEA ISLAND COTTON.—Market continues very quiet, with little or no cotton changing hands, such little demand as there is being at lower figures than owners are willing to accept. Every now and then small distress lots are offered, indicating that it would pay mills to send orders in force for a few days, provided they need any cotton. Average extra choice sells for 70 cents at New York.

COTTON FABRICS.—The market has been lifeless with no change in prices. Present prices on hose and belting duck will remain the same until January 1. While Government business has subsided, the mills are sold ahead on regular orders to next July, and it is not reasonable to look for change in prices for the next six months.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

Copyright, 1918.

NEW YORK.

HESITATION and dullness were the characteristics of the base metal market. The government and the copper producers have agreed that the maximum price for copper shall remain at 26 cents for the rest of the year; it is said that orders have been accepted at lower figures for delivery next year. The War Industries Board has announced a universal control of tin; in this country the metal can only be obtained from the American Iron and Steel Institute. Import licenses are to be issued only to the United States Steel Products Co., which puts importers in the United States and Canada out of business until further notice. The Lead Producers Committee continues its control of lead and the output is oversold. Antimony, which has been dull for some time, has fallen still further.

The market for rubber chemicals is in a state of uncertainty, there is a little depression, but, with the coming of peace, a considerable revival is hoped for.

ANILINE OIL.—There is a very strong demand, which producers are able to satisfy, but there are no large stocks on hand.

BARYTES.—Consumption continues to be about half the former average, but the cost of production is still so high that prices are unchanged.

CARBON TETRACHLORIDE.—As government control has not yet ceased, this product is practically unobtainable in the open market.

LITHOPONE.—Manufacturers, who have for some time been able to sell easily all they could make and at very good prices, are looking forward to a large export trade. Stocks on hand, as reported to the Lithopone Institute, are less than 25 per cent of what they used to be.

SULPHUR FLOUR.—There are many inquiries for delivery next year, the tendency seems to be toward lower prices on account of the coming of peace.

SULPHURIC ACID.—Producers are still unable to meet the demand, as there has as yet been no relaxation of government regulation.

TALC.—Many months will probably pass before any imported talc is obtainable in this country and there is a strong demand for the domestic product.

TAR AND PITCH.—The demand has weakened somewhat, which is not quite what had been expected on the signing of the armistice.

WHITING.—Producers can still scarcely meet all the demands for government work. Whiting is not easy to get in the open market, and yet there have been some cancellations of orders by the rubber trade.

ZINC OXIDE.—The market continues quiet and prices unchanged.

THE GRACE COMPANY IN THE FAR EAST.

Grace Brothers, Limited, importers of crude rubber, London, England, have acquired an interest in Lee, Hodges & Co., an old-established house of Colombo, Ceylon, which gives increased facilities for the purchase of Ceylon commodities and for the export of the company's English and American products to the markets of Ceylon and India.

A new agency has also been established by Grace Brothers, Limited, London, at Freetown, Sierra Leone, British West Africa, conducted as Grace Brothers & Co., Limited, with H. T. Wittington in charge as agent. Business will also be conducted in the British and French colonies north and south of this point.

SUBSCRIPTIONS: \$3.00 per year, \$1.75 for six months, prepaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, \$3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank draft, Post Office or Express money order on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**Nineteen-Nineteen.**

"BUSINESS as Usual?" Not a bit of it! This Year of Our Lord, now that "Gott" has abdicated, promises to be the biggest, best and happiest for generations. And the rubber trade? Just watch it grow.

THE YEAR IN REVIEW.

TO detail all of the notable and interesting happenings in the rubber trade for the last twelve months is a task that would seriously infringe the paper conservation rules. A bird's-eye view, however, shows the industry passing through lightning-like changes, from unpreparedness to readjustment, to contraction, to practical stoppage except for war work, and then to reconstruction.

Although in January a year ago, the industry was unprepared, individuals in the trade were already in the thick of the fight. Many adventurous and patriotic young men were in service as volunteer soldiers, aviators and ambulance drivers. Many "dollar a day" men were holding down important positions in Washington as organizers and experts. Industrial engineers, chemists and mechanics, were already leaving rubber and filling necessary places in war work plants. Then followed the volunteers and the drafted men, from office and factory

all over the country, by thousands and by ten thousands. No doubt the year will be known as a year of victory, but it is much else. It was a year of conservation, in rubber, coal, daylight, sulphur, gasoline, in almost everything except air and water. Manufacturers conserved labor and for the first time, woman became a great and helpful factor in rubber-manufacturing plants. Conservation in the line of investment was not, however, practiced. There were the four Liberty Loans, in each of which the trade went over the top, rubber men subscribing millions, promptly and generously. Then there were the gifts to the Red Cross, to the War Workers, to the French, Belgian, Armenian and other orphan funds, not to forget the investment in Thrift Stamps and War Saving Certificates.

With it all, through capable, hard working committees at home, rubber goods used in war work were standardized and turned out in quantities never before thought possible. New methods, new devices, and new compounds were created over night. With the scrapping of old methods, the dropping of "non-essentials" and the putting of big plants on a war basis, there was no disorganization. On the contrary the most wonderful organization that any industry has ever seen was created. To sum up—it was a good fight, cheerfully and efficiently fought, and 1918 is a year of which the trade may well be proud.

THE VICTORY BANQUET.

THE Annual Banquet of the Rubber Association of America to be held on the evening of January sixteenth, promises to be the most notable gathering that the trade has ever seen. Never before has it been so firmly knit in the bonds of successful effort, friendship and patriotism. Not again will there be available such an array of speakers afire with vital facts and thrilling anecdote. The times teem with problems of vast import. It is not idle prophecy to predict that in the speeches will be sounded the key-note of the great reconstruction that is already well begun.

AN ERA OF TRUSTS IN SIGHT.

THAT Germany to win back her place in the sun, even if it be under an umbrella of debt, will be and is already organized into a series of trusts, is to be expected. But that other European countries should be leaning somewhat the same way is surprising. Leaning is too mild, they are openly advocating amalgamations that will give quantity production, and that, assisted by government, will put them beyond the reach of ordinary competition. France and Italy are already planning extensive reconstruction in manufactures assisted by their respective governments. But it is in Great Britain that the promise of great trusts and amalgamations is noted. No less an authority than the Right Honorable Sir Albert Stanley, M. P., president of the British Board of Trade,

in a notable address before the Industrial Reconstruction Council, recently said:

It appears to me, therefore, that one of the first problems that we have to solve, and one to which the most earnest attention of manufacturers must be directed, is such an organization of industry as will make possible the complete overhauling of our industrial equipment, and establish large-scale production in all cases where it is economically advantageous, whilst in no way checking individual initiative and enterprise. How that result may best be attained, whether by the consolidation of companies or firms engaged in identical or allied branches of production, or by other forms of cooperation, is a matter primarily for those concerned in the industries themselves to determine; but I do say that considerable development of the kind is essential, especially in view of the competition of the great industries of other countries, particularly, the United States and Germany, which started from a much later stage in the world's industrial knowledge and experience, and have consequently been less influenced by tradition and less handicapped by works not up to modern standards.

That the British have ever been great and enterprising merchants none can deny. They have also been honest and above board in their merchandizing. If now they use in manufacture the conspicuous ability shown in quantity production of war material they will indeed be competitors hard to beat. Of course no great British rubber trust has yet appeared, but something of the sort is in the minds of those who plan to preserve the English industries.

A FRIENDLY MESSAGE FROM BRITAIN.

IN another column will be found a most timely and friendly letter from the Association of Rubber Manufacturers whose headquarters are in London. It is a vote of confidence in the integrity of the American rubber trade, and as such is a merited rebuke for those who for personal gain or perhaps from motives more sinister, strive to make trouble between the two great English-speaking countries. Such efforts if continued by the short-sighted, the selfish, and the prejudiced on either side of the water, will have little effect hereafter, at least in the rubber trade.

RUBBER RESTITUTION.

THE rubber trade of Germany may or may not have been in sympathy with the aims of the Prussian War Lords. From no individual in it, however, has come the slightest protest or hint of disagreement with the policy of destruction and frightfulness visited upon the French, Belgians, and Russians. Not only that, but according to reports, the rubber mills in occupied territories were dismantled and the stocks and machinery sent to Germany. In any equitable peace adjustment, the mills should be rebuilt, new machinery installed, and stocks replenished, if not by the German Government, then by the German rubber manufacturers. We could wish for the good of their souls that they do this voluntarily,

but that is perhaps too much to hope for. At all events, willingly or unwillingly, it should be done.

ALLOCATING GERMAN CRUDE RUBBER.

THAT Germany may pay her gigantic debts she must run her factories to the limit. To do this, certain raw materials controlled by the Allies are necessary. Of these is rubber. To be sure there are two opinions regarding the scarcity of rubber in Germany. One belief is that nothing but a poor grade of reclaim is to be found in all Teutonia. The other claims that by the development of synthetic rubber, and by the extraction of rubber from certain weeds and shrubs indigenous to Germany and Austria-Hungary, no great scarcity exists. Be that as it may, the cards will soon be on the table and these obscure points cleared up.

Before the war the Central Powers used some 20,000 tons of crude rubber, and a greater number of tons of reclaimed rubber. Supposing the needs for home consumption and such export trade as is still pro-German remain about as above, will Germany be allowed to go into the open market and purchase as much as she needs, and will ships be furnished to transport it? Or is it to be passed through Allied hands and allocated? This is a somewhat interesting question to planters, producers, and more remotely, to rubber manufacturers.

THOSE WHO APPRECIATE THE TEUTONIC LACK OF inventiveness are skeptical regarding the peace value of the floods of substitutes that war has forced them to develop and use. As far as the rubber industry is concerned the interest centers about synthetic rubber and cotton substitutes. With regard to the first there is no probability that it will have commercial value in times of peace, while the second may or may not be worth consideration. That the Allies refuse to grant protection to these or other war products would be only fair to a world impoverished by German greed. That is, unless a recreated Germany extends protection to Allied inventions.

JOINT ACTION ON THE PART OF THE USERS OF RAW materials is earnestly advocated by European publicists. If this crystallized into action it would mean cooperative buying of crude rubber either through government or a purchasing syndicate. If England, France, and the rest of the big European countries thus assured themselves of their crude rubber supply, would manufacturers in the United States buy as individuals what is left, or would they also buy, perhaps through The Rubber Association of America?

THERE ARE 2,000,000 ACRES OF PRODUCING CULTIVATED rubber trees in the world. Of these 1,600,000 acres are under British control. The market value of the shares representing this immense acreage was in August last, according to the London "Times," \$750,000,000.

Echoes of the Great War.

Function of the War Trade Board. Revised Procedure for Licensing Exports to or Through Allied Countries. The War Trade Board of the United States Russian Bureau, Inc. New Export Conservation List. Individuals Named as Enemies in President's Proclamation. More Athletic Goods for Men in Service. Jeannette War Service Activities to Continue. Service Notes and Personals.

FUNCTION OF THE WAR TRADE BOARD.

SPEAKING of the functions of the War Trade Board for the present and immediate future, Vance C. McCormick, chairman, said recently:

The War Trade Board has a function to perform until the peace treaty is signed. Under the terms of the armistice the blockade of the enemy countries is maintained, and the control over exports and imports is to be exercised.

Sufficient tonnage must be conserved by this control to supply the needs of our two million troops overseas, to guarantee them all possible protection and bring them safely home. There must be protection assured our Allies and the distressed and needy nations of Europe in the matter of supplies. When this work has been done, international trade can be quickly restored. Pending that time I have every confidence that the patriotism and justice of the American people will have them exercise patience until these vitally important plans are worked out and normal trade is resumed.

In the meantime the War Trade Board, in cooperation with the Allies, is relaxing just as far as possible every restriction which does not conflict with the above policy.

REVISED PROCEDURE FOR LICENSING EXPORTS TO OR THROUGH ALLIED COUNTRIES.

The War Trade Board announces the adoption of a simplified procedure effective for the issuance of export licenses for shipments which are:

(A) Destined to the United Kingdom, France, Italy, or Belgium (excluding their colonies, possessions, and protectorates), either directly or by way of any other country or colony; or

(B) Destined to any country or colony by way of the United Kingdom, France, Italy, or Belgium, excepting shipments destined to Switzerland by way of Italy.

The changes in the procedure are:

That holders of orders for export to the destinations and in the manner mentioned above in paragraphs (A) and (B) will be permitted to purchase or otherwise acquire or commence to manufacture or produce or fit the articles specified in the application for the fulfillment of a specific export order prior to the issuance of an export license.

That applications for licenses to export to the destinations and in the manner mentioned above in (A) and (B) will no longer be referred by the War Trade Board to the War Industries Board.

(1) Applications for licenses to export any commodities to the destinations and in the manner mentioned above in (A) and (B) must include one of each of the following papers properly executed:

(a) Application Form X, to which should be attached

(b) Such Supplemental Information Sheets as may be required by the rules and regulations of the War Trade Board to be used in connection with shipments of certain commodities or shipments to certain countries (such as Form X-1, X-2, etc.).

(c) A new Supplemental Information Sheet, Form X-122, in place of Form X-115.

(2) In Form X-122 the applicant is required to show that permission to import or purchase (if such permission is required) has been duly granted by the government of the allied country to or through which the shipment is to be made.

(3) Applications filed with Form X-122 attached should be mailed directly to the War Trade Board, Washington, D. C.

They will then be referred by the War Trade Board to the War Mission of the allied country to or through which shipment is to be made.

(4) This simplified procedure will relieve applicants for export licenses from giving certain information and making certain agreements as formerly prescribed on Form X-115.

THE WAR TRADE BOARD OF THE UNITED STATES RUSSIAN BUREAU, INC.

This company has been organized by the War Trade Board at the direction of the President of the United States to aid in supplying the needs of the people of Russia, in encouraging Russian production and trade, and assisting in the marketing of Russian products in America and their exchange for American goods, for the purpose of helping the Russians to help themselves in stabilizing the economic situation in Russia. It has a capital stock of \$5,000,000, all of which has been issued and fully paid in cash out of government funds. The stock is owned in its entirety by the United States Government.

The company will engage in the business of exporting to Russia and Siberia agricultural implements, shoes, clothing, and other commodities which the Russian population need, and of importing Russian and Siberian raw materials in return. One of the chief objects will be the encouragement of private capital to engage in trade in Russia and Siberia as shipping becomes available for the purpose. The policy will be to cooperate with, encourage and promote such trade with Russia as will assist in the rehabilitation of her economic life, and to cover by direct operations only such portions of the field as cannot at present be served readily by private enterprise.

The head office of the Russian Bureau is in the War Trade Board Building at Washington, D. C. The board of directors of the company consists of the members of the War Trade Board. Hon. Vance C. McCormick, chairman of the War Trade Board, is president of the company; John Foster Dulles is secretary and treasurer, and Henry B. Van Sinderen is acting manager. The directors are Vance C. McCormick, Thomas L. Chadbourne, Jr., Edwin F. Gay, Albert Strauss, Alonzo E. Taylor, J. Beaver White, and Clarence M. Woolley.

NEW EXPORT CONSERVATION LIST.

The new list effective December 20, 1918, superseding all previous lists, includes the following items of rubber interest. Shippers are reminded that individual licenses are required for shipment of all commodities covered by the export conservation list to all countries, including Canada and Newfoundland: Crude rubber, guayule, balata, gutta percha, gutta siak, jelutong, reclaimed rubber, scrap rubber, burlap, aniline oil, corn oil, gasoline, naphtha.

INDIVIDUALS NAMED AS ENEMIES IN PRESIDENT'S PROCLAMATION.

The President of the United States has designated the following persons as included within the term "enemy," under the Trading-with-the-Enemy Act: Charles Duisberg, Christian Hess, and Rudolph Mann, of Leverkusen, Germany; A. W. Faber, Stein, Germany; H. Otto Traun, Hamburg, Germany; Paul Mecke, Heppel Leop. Estate of Von der Heide, and Bitumen Wundersche, all of Unna, Germany; H. Rost & Co., Dr. F. Lampert, Mrs. Anna L. Lampert, Mrs. Caroline Soltan, and Mrs. Olga J. C. Schrupf, all of Hamburg, Germany; and Robert Bosch and associates, of Stuttgart, Germany.

MORE ATHLETIC GOODS FOR MEN IN SERVICE.

During the past year contracts for athletic equipment amounting to \$795,000 have been awarded by the War Department Commission on Training Camp Activities. The last contract, awarded in November, called for the following items of interest to the rubber trade: 5,400 medicine balls, 6,000 Rugby footballs, 12,000 soccer footballs, 3,000 Rugby bladders, 6,000 soccer bladders, 18,000 playground balls and 3,000 basket-balls.

There is still about half a million dollars available for further expenditures and the Commission is inclined to enlarge the shipments of their supplies rather than otherwise. It is realized that the armistice increases the need for athletic supplies, as the let-down will be severe unless particular effort is made to maintain the morale of the men.

JEANNETTE WAR SERVICE ACTIVITIES TO CONTINUE.

Jeannette, Pennsylvania, does not intend to neglect the future welfare of returning soldiers and their dependents now that the war is over. The Jeannette War Service Union prides itself on having, in a little city of only 12,000 inhabitants, over 4,200 monthly contributors and no delinquents. The president, Seneca G. Lewis, general manager of the Pennsylvania Rubber Co., states that although the Union has a fund exceeding \$15,000 in the treasury, after meeting all possible contingencies in connection with war work, it is intended to continue indefinitely in order to safeguard absolutely all returning men who may need assistance.

SERVICE NOTES AND PERSONALS.

While the majority of the sons of the rubber men will soon return home and resume their pre-war occupations, others will continue to wear khaki. Of the last-named type is Lieutenant-Colonel Fred Garcin, now stationed at San Francisco, but likely at any moment

LIEUTENANT-COLONEL
F. R. GARCIN.

to be sent overseas, perhaps to Siberia, or to any of the scores of places in Central Europe where Uncle Sam's Regulars are in more or less temporary control. For Colonel Garcin is of the Regular Army, having chosen this profession some four years before the war began. Furthermore, he joined the Artillery, which branch of the service has shown such notable advancement in the past four years, and has called for the severest sort of scientific attainment. The fact that Mr. Garcin was advanced from the grade of second lieutenant to that of lieutenant-colonel testifies to his ability as an officer. Incidentally, he is the youngest officer of his rank in the service. It is interesting to note that he is the only son of Edward H. Garcin, long known as a prominent manufacturer of mechanical rubber goods and asbestos and rubber specialties.

Looking Backward—and Forward.

What Men Prominent in the Trade Say of the Year's Happenings.

FROM IMPORTANT MEMBERS OF THE WAR SERVICE COMMITTEE.

THE consensus of opinion appears to be that with the complete withdrawal of government control and supervision the rubber industry is about to enter a period of great expansion and prosperity in which wartime conservation and standardization will prove a beneficial influence; that the necessary readjustments will be effected with comparative ease, and that the inevitable cancellations of government contracts will work no great hardships because of the volume of long-standing orders for normal business in most lines of rubber goods.

BOOT AND SHOE DIVISION.

GEORGE H. MAYO, CHAIRMAN.

"The footwear division of the War Service Committee of the Rubber Industry worked in the closest harmony throughout the war, and one and all contributed patriotically to the service of the Government. There seems to be much that could properly be done under peace conditions for the welfare of the industry and I am in hopes it will seem wise to the committee to continue some of the constructive work that has been undertaken by them."

CLOTHING DIVISION.

N. LINCOLN GREENE, CHAIRMAN.

"During the period of the war we have given to the Government our capacity, and more, and with the abrupt cancellation of government contracts, will naturally find it somewhat difficult to readjust production to a normal basis, although we fully expect to get from under such a condition at an early date.

"In our opinion, the cessation of the war will not be the cause of great reduction in prices, for such goods as we will market for the coming season are based on what we would term the peak of prices in labor, materials, and findings.

"The experience and advantage that has been gained through a classification of various types of business into committees under the supervision of the War Industries Board will be of great benefit in shaping policies for the future, having always

in mind the thought of conservation; it having been clearly shown that many articles and many of the minor details that have been treated as essential in the past might be easily dispensed with.

"It is our opinion that there will be some months of depression, to be followed by the largest and most active business ever known to our industry."

CRUDE RUBBER AND KINDRED PRODUCTS DIVISION.

CHARLES T. WILSON, CHAIRMAN.

"The War Trade Board will continue to exercise their control over crude rubber until actual peace is declared. Therefore, the duties of the division in carrying out their instructions in respect to their various regulations will be likely to go on until this time."

FOREIGN TRADE DIVISION.

E. H. HUXLEY, CHAIRMAN.

"With the close of the war we find ourselves free to develop our export trade without the ball and chain of government control being dragged after us. This is a great relief, but we still have serious problems to solve.

"Shall we be able to hold the trade that has come to us with so little foreign competition, and shall we be able to increase it? We are now confronted with a period when competition will be free and open to all, and when it will not be confined to our fellow-American manufacturers, but to the tried and experienced exporting manufacturers of Europe. With anything like equal conditions we shall be successful competitors. To make the conditions equal, however, we must have reasonably equal labor conditions and rates of pay; reasonably equal facilities for shipping and reasonably equal rates; and, also, access to and prices for raw materials on a par with our foreign competitor. Optimists believe that we shall have these equalities, and it is not difficult to be an optimist. There is much to be accomplished to bring about the result, but there appears to be no reason to doubt that it will come. We cannot, of course, overlook that most important feature, namely, manufacturing methods, but no one

doubts the ability of the United States to compete on this score, for the ingenuity, resourcefulness and initiative of the American manufacturer are proverbial.

"The closing of the war cannot help being beneficial, and with the many advantages of the position in which the United States finds itself, optimism would appear to be thoroughly justified in contemplating the future."

GAS DEFENSE DIVISION.

DR. W. C. GEER, CHAIRMAN.

"The Gas Defense Division of the War Service Committee of the Rubber Industry has spent considerable time during the past year in assisting the Gas Defense Service of the War Department in writing their specifications for the various rubber parts of gas-masks. We have cooperated with them in the development of design, compounding, and manufacturing methods, and a large amount of work has been done.

"Since the gas-mask is purely a war munition, the ending of the war means the closing of the work and, therefore, as soon as the orders from the Gas Defense Service ceased, due to the signing of the armistice, the work of the Gas Defense Division of the War Service Committee also ceased. There is nothing more for us to do."

HARD RUBBER DIVISION.

H. WEIDA, CHAIRMAN.

"For the past eighteen months practically all the hard-rubber manufacturers were making hard-rubber parts for war essentials, requiring from 60 to 95 per cent of their total output, and due to the governmental needs it was necessary to refuse to take orders for the regular commercial lines which were enjoyed before the war.

"Now that the war is over, every effort is being made to put the industry back on a peace basis, with the idea of again serving our customers with the same dispatch as before the war.

"The future of the hard-rubber industry is very promising, and with the increased manufacturing facilities of the United States, brought on by the war, and the constant new uses to which hard rubber can be profitably put, together with the possibility of supplying the European countries with the same line furnished them by Germany before the war, I am sure that the very best years in the history of the industry are before us."

INSULATED WIRE AND CABLE DIVISION.

WALLACE S. CLARK, CHAIRMAN.

"The cessation of active hostilities has meant the suspension of manufacture and the probable ultimate cancellation of orders for some \$30,000,000 worth of insulated wire and cable.

"The first effect of this will be to allow many long-standing orders for the smaller sizes of commercial rubber-insulated conductors to be manufactured and shipped by manufacturers. Secondly, it should allow the replacement of depleted stocks throughout the country.

"It is felt by the division that this activity will largely carry the manufacturers over the pause before the return of normal business. In so far as the division has gone into this matter, the attitude of the various government departments concerned in the termination of existing contracts has been fair and reasonable."

MECHANICAL GOODS.

E. S. WILLIAMS, CHAIRMAN.

"The ending of the war finds the Mechanical Goods Division of the War Service Committee in the position of not having received official notification of the approval of the various recommendations this committee made with regard to conservation and standardization of mechanical goods. The committee submitted a questionnaire to all mechanical-goods manufacturers and after due consideration, somewhat prolonged by the complexity of the subject, a number of recommendations were made to the Conservation Division of the War Industries Board last summer. These recommendations cover a maximum number of goods, allowable for belting, steam hose, water hose, and many other lines.

"The mechanical-rubber business has been built up on a multiplicity of styles and grades of goods, each produced to meet particular conditions of competition and use. It is felt that while there are great difficulties in the way of a standard maximum number of grades, still, a great deal of good would be accomplished by the adoption of some such standards. The Conservation Division appeared to favor the recommendations made, but for one reason and another official sanction and promulgation was delayed and the signing of the armistice found the matter still pending.

"It is now hoped that the benefit of the work already done will not be lost, and that the regular organization of the Rubber Association will take up the matter and make such modifications as seem advisable under peace conditions and try to bring about an agreement on the subject which will be beneficial to all."

MEDICAL RUBBER GOODS AND SUNDRIES DIVISION.

A. W. WARREN, CHAIRMAN.

"The ending of the war necessarily caused the cancellation of many large contracts from the medical department of the United States Army, and while these contracts are now pending adjustment, it is not thought among the trade that the sudden discontinuation of the placing of large orders will in any way affect this particular branch of the rubber industry.

"As a matter of fact, most of the contracts had been placed with specifications for delivery not later than December 31, and while the contracts were unusually large for this particular class of merchandise, it did not to any great extent interfere with the commercial business, on account of the preferential rating given the medical rubber goods industry."

PNEUMATIC TIRE DIVISION.

G. M. STADELMAN, CHAIRMAN.

"The ending of the war means the termination of the activities of the Pneumatic Tire Division of the War Service Committee at the same time the War Industries Board ceases to function.

"Were it not for the fact that the Pneumatic Tire Division expects to ally itself with the Rubber Association of America as a division of that association, all of the good work which has been done with respect to conservation and standardization would be lost. It is my belief, however, that this work will be carried on by this new body."

RAILWAY SUPPLIES DIVISION.

H. E. RAYMOND, CHAIRMAN.

"It is understood that the life of the War Service Committee of the Rubber Industry will terminate January 16, 1919, coincident with the annual meeting of The Rubber Association of America. Automatically its sub-committees will cease to be. The Rubber Association will continue to serve the Government where needed to wind up matters pending, inclusive of railroad needs.

"My division of activity will have accomplished several important acts of standardization, continuing for all time to come, which the war's ending will not destroy."

RECLAIMED RUBBER DIVISION.

F. H. APPLETON, CHAIRMAN.

"In my opinion, now that the rubber manufacturers are no longer making war goods, and therefore, are enabled to resume their regular lines, it would seem that the demand for reclaimed rubber should return to normal."

SOLID TIRE DIVISION.

J. W. THOMAS, CHAIRMAN.

"It is to be hoped that our industry will recognize that, notwithstanding the termination of the war, there is still a great patriotic work to be done by many of the committees which have been appointed. Generally speaking, the standardization work of any industry tends to improve the general economic conditions of the country. The prevention of waste and the concentration of effort along certain well-defined lines is as much a patriotic duty in times of peace as in war.

"Our industry as a whole will be immensely benefited by the standardizations which have been formulated by the Solid Tire Division, and the truck owner will be equally benefited if the truck builder recognizes the value of this work and accepts the standardizations in the same spirit that prompted their creation. The work in the immediate future by the Solid Tire Division is to promote the general adoption in commercial lines of the standardizations which the division has created. The honest effort and whole-hearted enthusiasm which has been shown in the work of the Solid Tire Division is very gratifying, and is indicative of what our industry can really accomplish by the continuation of such committee work in time of peace."

THE RUBBER ASSOCIATION AND THE WAR SERVICE COMMITTEE.

"More remarkable has been the manner in which the rubber industry, through its representatives, has enforced the restrictions and managed the details of import and export licensing, curtailment, and allocation, affecting it under the direction of the War Trade Board. For untiring and impartial service, sound judgment and keen foresight, the officials of The Rubber Association of America and the members of the War Service Committee of the Rubber Industry, including its numerous divisions, deserve the grateful appreciation of the whole trade.

"Following the industrial mobilization of the country in December, 1917, and the organization of the War Service Committee to assist the Government, events of great moment to the rubber industry crowded one upon another in rapid sequence. To prevent crude rubber and rubber goods from reaching the enemy, all imports of crude rubber and allied gums, cotton and other materials were put under license. The Rubber Association was asked by the War Trade Board to act as consignee of all importations of crude rubber from foreign countries, to be released only under guarantees of good faith. For the same reasons, to prevent shortage and to conserve them for ourselves and our allies, rubber and allied gums, also numerous chemicals and compounding ingredients, were placed on the Export Embargo List. That the enemy might not profit from American business, the Enemy Trading List was issued, prohibiting trade with certain Latin-American firms. In February, these precautions were followed by placing all imports and exports under license.

"By May the demands upon the available ship tonnage had become so great that drastic restrictions in overseas commerce became necessary and the importation of crude rubber, along with other commodities, was curtailed. To prevent speculation, maximum prices for the various grades were fixed in advance. The basis of importation for a three months' period was set at 100,000 tons per annum; government needs, estimated at 35,000 tons, were deducted and the balance allocated pro rata to each firm on a basis of 7/16 of its 1917 consumption. This arrangement and subsequent modifications were worked out with the aid of data furnished by a series of questionnaires issued to the trade by the War Service Committee, in which, for the first time in history, rubber manufacturers told how much crude and reclaimed rubber they consumed."

ENTHUSIASTIC SERVICE.

"Hampered by coal and labor shortages, enforced holidays, transportation difficulties, adverse priorities, embargo, restriction, curtailment, and allocation of raw materials and finished products, high taxes and constantly advancing costs for wages and most commodities, rubber men have persisted in patriotic optimism and practical helpfulness rather than self-pity. Their zeal to further American participation in the war is imperishably written in the records of every campaign for Liberty Bonds, War Savings Stamps, United War Work and Red Cross funds; it is seen in the innumerable firm and community funds to provide wholesome entertainment, reading matter, athletic goods, comfort kits and smokes for the boys in service; it is mani-

fested by the enthusiasm for Americanization in rubber mills, that foreign-born employees may be educated in our language and ideals. Service flags in virtually every establishment bear eloquent testimony to the thousands of officials and employees in various branches of war service, many being in executive government positions of great responsibility."

PRACTICAL PATRIOTISM.

"This world conflict has placed rubber goods among the prime essentials of modern warfare, and the industry may take a just pride in the notably high average quality of the goods supplied and the marked absence of anything savoring of profiteering. Even the unfortunate raincoat scandal is being shown in the courts to be the fault of irresponsible workers and careless inspectors rather than that of the rubber industry. The dispatch with which enormous quantities of waterproof garments, gas-masks, and other rubber goods were supplied to the Army and Navy was truly wonderful, while the eagerness with which the entire heavy-footwear producing capacity of the country was placed at the disposal of the Government until military needs for millions of pairs of rubber boots, overshoes and gaiters were met, regardless of more lucrative civilian orders, exemplifies the sort of practical patriotism that has animated the trade."

CYCLE AND MOTOR TRUCK TIRES.

"The past year has witnessed enormous economic changes brought about by the war, which affect the rubber industry greatly. Higher transportation costs have increased the use of the bicycle, with a consequent greater demand for tires. But of far more importance is the enormous development of motor trucks for army use, delivery purposes, short-haul and even long-distance overland freights in which a few rubber companies were among the pioneers. More than half a million motor trucks are now in use in the United States, and it is confidently predicted that in five years there will be four millions. A phenomenal growth of the solid-tire industry has resulted. Meanwhile, too, cord construction has removed the previous limits of pneumatic-tire sizes, and 12-inch cord tires are now being successfully used on the heaviest trucks, prolonging their life and increasing their speed. Nothing can stop this great economic movement except the failure to build hard-surfaced roads of adequate strength to carry the greater tonnage at the higher speed required, and with government officials everywhere awake to the need, an adequate construction program seems assured.

"New industries have been created and further incentive given to the old by the abnormal conditions affecting raw materials. The prevailing spirit of economy, the necessity to conserve rubber, the high cost and shortage of tires, and the importance of obtaining maximum service from them have all been factors in the new industry of retreading or rebuilding tires, which has assumed considerable importance in America during the last twelvemonth. Henceforth thousands of automobile tires, such as were formerly discarded prematurely, will be rehabilitated for further service at a lower cost per mile than that of new tires."

THE SPIRIT OF COOPERATION.

"Certainly the magnificent spirit of patriotism and cooperation in which the trade as a whole has faced the problems and hardships of the war, always making its decisions for the good of the entire industry, indicates with what confidence the period of readjustment and reconstruction may be looked forward to. In this connection legalized export combinations in America will go a long way to offset the scheme of a possible Prussian rubber trust to secure an inordinate share of foreign trade."

RUBBER PRODUCTION IN THE FAR EAST.

Messrs. Harrisons and Crosfield, Limited, London, England, calculate that the annual production of plantation rubber in the Far East will amount to 350,000 tons when the 2,000,000 acres of trees have all attained 400 pounds per acre.

Activities of the Rubber Association of America, Inc.

DECEMBER has been an eventful month for the rubber industry in the removal of manufactured rubber products from the export conservation list, the withdrawal of all restrictions governing the production of rubber products, and the removal of all restrictions relating to the imports of crude rubber. Imports will continue to be consigned to The Rubber Association and the usual guarantees required. Members of the Association were promptly informed of these and other events of interest to the trade by the following communications from The Rubber Association and the War Service Committee:

MANUFACTURED PRODUCTS FREE OF EXPORT.

December 2, 1918.

To all rubber manufacturers:

We quote herein a letter received from the Bureau of Imports of the War Trade Board, under date of November 27, 1918:

For your information we advise you that manufactured rubber products have been removed from the Export Conservation List, effective November 27, 1918. This means that after that date it will not be necessary for exporters to obtain their licenses for export shipments of manufactured rubber products from the Bureau of Exports in Washington, as heretofore. The branch offices of that Bureau will issue the licenses in the future.

TRAFFIC COMMITTEE'S VIEW OF TRANSPORTATION PROBLEM.

December 4, 1918.

To firm members of The Rubber Association of America:

The Traffic Committee wishes to bring to the attention of the members of this association what is believed by many to be the most important transportation problem ever presented to the American people, namely, the future operation of our transportation facilities through the medium of government ownership or the restoration of the properties to their owners with continued private control under reasonable governmental regulation.

The committee believes that the cessation of the war has brought about a very great change in the transportation needs of the country and that the best interests of the shipping public can be met only by private control and operation subject to reasonable regulation by our Government, such regulation to permit efficient competition. The committee realizes that undoubtedly many methods formerly in vogue in connection with the operation of our transportation system should not be used again and that any of the benefits to the public that have been made possible by unified control should be retained.

Please understand that the Traffic Committee has reached this conclusion only after careful thought and investigation and the committee's consideration was not subject to any influence other than the desire to protect the transportation interests of the industry.

At the annual meeting of the Traffic Club of New York, held on Tuesday, the 26th ultimo, those present were particularly fortunate to have the privilege of listening to a clear presentation of the transportation problems by Lewis J. Spence, Director of Traffic, Southern Pacific Co. Mr. Spence's views of the situation are so clear and fundamentally sound that this committee believes that every one interested in transportation matters should read his address.

We appreciate fully that with respect to a problem of this kind the members may have reached a conclusion based on their experience with transportation conditions, but we respectfully suggest that if the individual members can share the view of this committee, the able presentation of the matter by Mr. Spence should be placed in the hands of the congressmen and senators of your congressional districts and states, accompanied by an appeal for their support in reasonable and sane regulation of transportation facilities, to the end that they may be returned to their owners for operation with reasonable businesslike regulation by our Government.

PACIFIC COAST EXPORT BILLS OF LADING.

December 10, 1918.

To firm members of The Rubber Association of America:

Your attention is directed by the Traffic Committee to the following notice issued by Regional Directors A. H. Smith and C. H. Markham of the Eastern and Allegheny Regions, respectively,

relating to the issuance of export bills of lading via Pacific Coast ports:

To All Concerned:

For the purpose of issuing export bills of lading via Pacific Coast ports, the Trans-Pacific Export Bill of Lading Agency is hereby established as of December 15, 1918, located at 143 Liberty street, New York City, with C. H. Morehouse, Agent, in charge.

To minimize the work and facilitate the issuance of export bills of lading, the following rules are prescribed:

The exporter or shipper will be required to make all necessary copies of bills of lading, showing thereon the export license number and date of expiration; the railroad permit number, weight, measurement, rate, inland, ocean and State toll charges.

All bookings with steamship lines must be made by the shipper or exporter through their own agencies.

Railroad permits are required in all cases and may be obtained by the exporter or shipper through their Pacific Coast representative or by agent with whom the booking was made. Such permits are issued by the North Pacific Export Committee at Seattle, Washington, and the California Export Committee at San Francisco, California.

Advices of clearances at ports of exit, when required, must be obtained by exporters or shippers through the agency with whom booking was made.

The payment of all bills covering inland, ocean and State toll charges must be made within the provisions of Director General's Orders Nos. 25 and 25-A.

NOMINATING COMMITTEE'S REPORT.

December 12, 1918.

To the firm members of The Rubber Association of America:

Pursuant to article VI, section 2, paragraph (a) of the constitution and by-laws of The Rubber Association of America, Inc., the undersigned Committee on Nominations submit the following list of nominations for four directors to succeed those whose terms expire in January, 1919:

James Newton Gunn, United States Tire Co.; John S. Lowman, Philadelphia Rubber Works Co.; A. D. Thornton, Canadian Consolidated Rubber Co., Ltd.; Seneca G. Lewis, Pennsylvania Rubber Co.

These nominations are to be voted upon at the annual meeting to be held at the Waldorf-Astoria, New York, on January 16, 1919.

In accordance with the amendment to the constitution and by-laws adopted at the annual meeting of the Association in January, 1918, all directors of The Rubber Associations are now elected for terms of three years.

CALL FOR ANNUAL MEETING.

December 16, 1918.

To the firm members of The Rubber Association of America:

You are hereby notified that the annual meeting of The Rubber Association of America, Inc., will be held at the Waldorf-Astoria, New York, on Thursday, January 16, 1919, at 4 o'clock p. m., at which meeting four directors to serve three years, to succeed those whose terms expire at that time, will be elected, and the reports of the officers submitted.

The Board of Directors recommends that the constitution and by-laws of the Association be amended so that elections to membership in the Association may be by vote of the Board of Directors, as well as by the Executive Committee; also that Article XII of the constitution and by-laws entitled "Entertainments" be amended so that entertainments and dinners of the Association may be held at the discretion of the Board of Directors or the Executive Committee, instead of at the discretion of the Executive Committee alone, as it reads at present; also that Article XIV entitled "Expulsions or Suspensions" be amended so that the Board of Directors will have equal authority with the Executive Committee in such cases.

Every firm member of the Association is entitled to be represented at the annual meeting by the registered firm representative, but the firm representative's voting power may be delegated to some one in the employ of or acting for such member by giving a written proxy. Each firm member is entitled to one vote. Should your firm representative be unable to attend the annual meeting, he may execute the enclosed blank proxy and direct the person in whose favor he executes such proxy to present the same at the entrance to the meeting.

The annual meeting will be followed by the nineteenth annual banquet, which this year takes the form of a Victory Banquet, in the grand ball-room of the Waldorf-Astoria, at 7.30 o'clock in the evening.

FIRM AND ASSOCIATE MEMBERS ELECTED.

The Executive Committee elected the following firm and associate members at the meeting of December 19:

FIRM MEMBERS AND REPRESENTATIVES.

Arnold W. Francis, Arnold W. Francis, 66 New street, New York City.

The Rosendale-Reddaway Belting & Hose Co., Henry P. Wherry, 23 Euclid avenue, Newark, New Jersey.

Alfred Hale Rubber Co., David A. Cutler, Atlantic, Massachusetts.

ASSOCIATE MEMBER.

W. H. Parker, National Standard Co., Niles, Michigan.

VICTORY BANQUET.

The nineteenth annual banquet of The Rubber Association of America, Inc., will take the form of a Victory Banquet and will be held in the grand ballroom of the Waldorf-Astoria, 5th avenue and 34th street, New York, on Thursday evening, January 16, 1919, at seven-thirty o'clock. Tickets will be twelve dollars.

Arrangements have been made for seating guests at round tables accommodating parties of eight or ten persons. Members desiring entire tables, or those who wish to sit together but do not require an entire table, will kindly state their wishes when ordering tickets, using the form provided. Tickets are sold only to members or to those in their employ, but there is no limitation to the number which each member may purchase.

WAR SERVICE COMMITTEE OF THE RUBBER INDUSTRY.

RUBBER RESTRICTIONS REMOVED.

THE following telegram and detailed information was sent to the rubber trade on December 13, 1918, as a result of the meeting of the chairmen of the various war service committees held on the same date:

We are pleased to advise that all restrictions governing production of rubber products and the amount of crude rubber that may be imported from primary markets have been withdrawn effective to-day. Rubber will be consigned to the Rubber Association as heretofore and the usual guarantee will be required, but maximum prices on allocation features are entirely eliminated.

WAR SERVICE COMMITTEE OF THE RUBBER INDUSTRY.

DETAILS OF THE RULINGS.

To the rubber industry:

Confirming our telegram of this date, we quote below letter received from the War Industries Board:

United States War Industries Board,
Washington, D. C.

December 12, 1918.

War Service Committee of the Rubber Industry, U. S. A.:

Beg to advise that effective December 13, 1918 all restrictions governing the production of all rubber articles, including casings and tubes under six inches, are herewith withdrawn. This ruling annuls Issue No. 2, Regulations Governing the Production of Rubber Products and revised schedules on casings and tubes authorized November 16, 1918, by the rubber section for the October-December period. Kindly wire all manufacturers accordingly.

H. T. DUNN, Chief.

Rubber Section, War Industries Board.

From the above you will note that all restrictions as to production of manufactured rubber goods have been removed, effective immediately.

We also received the following instructions from the War Trade Board contained in letter and telegram of this date:

By a regulation passed this day by the War Trade Board the restriction as to quantity of crude rubber which may be licensed for shipment from overseas has been revoked, effective immediately. On and after this date, licenses to import crude rubber from overseas will be issued without limit as to quantity, provided applicant conforms with all existing regulations of the War Trade Board. The War Trade Board also withdraws the maximum prices and the allocation features. Rubber will continue to be consigned to The Rubber Association

as heretofore and the Association will continue to require the usual guarantees.

Your attention is directed to the fact that the relaxation of this restriction only affects shipments from overseas. We are informed it will not be the general policy of the War Trade Board to issue licenses for the importation of rubber from countries other than those of origin until after February 13, 1919, and that this same policy will apply to shipments now in the United States which have arrived in violation of the regulations.

WAR SERVICE COMMITTEE.

RUBBER GOODS IMPORTS PERMITTED.

DECEMBER 20, 1918.

To manufacturers and importers of rubber manufactured goods:

We quote below letter received from the War Trade Board notifying us of the revocation of the regulation prohibiting the importation of manufactured rubber goods:

For your information we would advise you that the War Trade Board ruling prohibiting the importation of rubber manufactured goods has been revoked by War Trade Board ruling No. 427 and the Bureau of Imports has been instructed to issue licenses permitting the importation of rubber manufactured goods provided applications conform to other regulations of the War Trade Board.

STANDARDIZATION AND CONSERVATION SHOULD CONTINUE.

While all conservation rulings have been revoked, the War Industries Board expresses the hope in the following letter from the Conservation Division, that the rubber industry will continue to eliminate needless waste:

Owing to the changed conditions in the rubber industry the Conservation Division has decided, with the concurrence of the Rubber Section, that the various conservation schedules that have been issued to rubber manufacturers will be rescinded. Will you please notify the members of the industry of this decision?

The information that we have received in the course of our inquiries regarding these schedules indicates clearly that substantial savings of labor, material, equipment and capital are resulting. We heartily appreciate the ready spirit of cooperation that has been shown by the rubber industry and we hope that the industry of its own accord will find it possible to continue to observe those provisions of the schedules which eliminate needless waste and can be carried out without real hardship.

NEW DIVISIONS TO BE ORGANIZED.

In view of the above communication the War Service Committee has suggested that the chairmen of those divisions not already divisions of The Rubber Association extend an invitation to the manufacturers to attend a luncheon-meeting at the Waldorf-Astoria January 16 and organize similar divisions of the Rubber Association.

REDUCTION IN ZINC OXIDE PRICES.

The New Jersey Zinc Co., New York City, announced December 14, 1918, a reduction in prices on its brands of zinc oxide and lithopone used by the rubber trade. The new price list, which became effective immediately, and which applies on contracts for the first quarter of 1919, follows:

AMERICAN PROCESS.		Carloads.	Less Carloads.
Special	10½	10¾
XX	10	10¼
FRENCH PROCESS "FLORENCE BRANDS."		Carloads.	Less Carloads.
White Seal	13	13½
Green Seal	12½	12¾
Red Seal	12	12¾
Lithopone	7½	8

Above prices apply only when packed in barrels. When packed in bags the price is one-eighth of a cent per pound less.

ABOLITION OF EXPORT DUTY ON RUBBER AT IQUITOS.

The duty of \$0.44 per 100 pounds on rubber exported from Iquitos, Peru, has been repealed. Rubber exports from other Peruvian points is still subject to the regular export duty of 8 per cent, ad valorem, except rubber from Putumayo, which pays only half that amount.

Government Specifications for Tires, Tubes, Repair Materials and Accessories.

THE Motor Transport Corps of the United States Army, the War Service Committee of the Rubber Industry, and the Special Board of Officers, convened under paragraph 30, S. O. 91, W. D., 1918, have prepared and approved the following specifications for pneumatic tires, including automobile, motorcycle and bicycle tires; solid motor tires, repair material and accessories. These specifications were revised to November 1, and supersede those published in THE INDIA RUBBER WORLD October 1, 1918.

CLINCHER BICYCLE TIRES.

SIZES 28 BY 1½ INCHES AND 28 BY 1½ INCHES.

FABRIC CONSTRUCTION.

Specification No. 1221A.

NOVEMBER 1, 1918.

1. GENERAL. (a) Bicycle pneumatic casings manufactured in accordance with this specification shall be of fabric or cord construction of the sizes known as 28 by 1½ inches and 28 by 1½ inches.

(b) The manufacturer of casings must guarantee them to be free from defects in workmanship and material.

(c) The casings shall be plainly marked with the manufacturer's name and size of tire.

2. TYPE. All casings furnished on this specification shall be of the manufacturer's standard non-skid double clincher type, designed to satisfactorily fit the standard 28 by 1½ inches single clinch all steel bicycle rim.

3. CONSTRUCTION. (a) Carcass of the casings must consist of two plies of fabric (including both sides of the fabric) having a tensile strength for both warp and filler of not less than 110 pounds per inch or its physical equivalent of cords as approved by the Government. Methods of testing to be the same as provided in the specifications for pneumatic automobile casings.

(b) All fabric must be thoroughly dried in accordance with standard manufacturing practice before it is started through the process of rubberizing.

(c) The sidewall of the casing shall not be less than 0.130 inch thick when measured on the cured casing.

4. PHYSICAL MEASUREMENTS AND TESTS. (a) The cross-sectional diameter of each tire inflated at 40 pounds shall not be less than 1.29/64 inches in 28 by 1½ inches and 1.37/64 inches in 28 by 1½ inches.

(b) Strength of the union between plies of fabric shall average ten pounds or more per inch using the standard dead weight friction test as provided in the specifications for pneumatic automobile casings.

(c) The strength of the union between tread and plies or between tread and plies shall average ten pounds or more using the standard dead weight friction test as above provided.

5. FLAPS. Each casing shall have a flap in accordance with the standard commercial practice.

6. COMPOUNDS. (a) Tread—The tread shall be made from and have the characteristics of a compound containing at least 55 per cent by volume of the best quality new wild or plantation rubber. The minimum tensile strength shall be 1,600 pounds per square inch with a minimum elongation of 400 per cent (2 to 10 inches) as determined by the average of four test pieces when stretched at the rate of twenty inches per minute. The test pieces shall be cut longitudinally and shall be 1-inch wide of a gage length of two inches, the ends being gradually enlarged to a width of approximately one inch. The permanent set determined by the average of four tests with test pieces as above, shall not exceed 25 per cent after an elongation of 400 per cent (2 to 10 inches) for ten minutes. All tests shall be made at a temperature between 65 degrees and 90 degrees F.

(b) Friction—The friction shall be made from a standard character of a compound containing at least 55 per cent by volume of the best quality new wild or plantation rubber.

(c) Sidewalls—The sidewalls shall be made from and have the characteristics of a compound containing at least 55 per cent by volume of the best quality new wild or plantation rubber. The minimum tensile strength of the sidewall rubber shall be 1,200 pounds per square inch with a minimum elongation of 400 per cent (2 to 10 inches). The permanent set shall not exceed a maximum of 25 per cent as determined by the average of four tests as described in 6(a).

(d) Compound shall be free from ingredients known to the rubber trade as oil substitutes.

(e) The manufacturer must state the amount and kind of reclaimed rubber used in compounds.

(f) All above test pieces must be cut from casings.

7. INSPECTION. The Government reserves the right to make any inspection, test or analysis necessary to assure the product meeting all requirements of this specification.

8. TUBES. The inner tube shall meet the specifications of the automobile and motorcycle tubes, with the following exceptions: (a) minimum ply size shall be 1-inch; (b) minimum gage shall be 0.048-inch; (c) the valve shall be Schrader's 1022, or its approved equivalent.

9. PACKING. Packing shall be as per specifications accompanying the request for bid.

PNEUMATIC MOTORCYCLE CASINGS (NON-SKID).

SIZE 28 BY 3 INCHES.

FABRIC CONSTRUCTION.

Specification No. 1064A.

NOVEMBER 1, 1918.

1. GENERAL. (a) Pneumatic motorcycle casings manufactured in accordance with this specification shall be of fabric construction of the size known to the trade as 28 by 3 inches.

(b) Casings must be designed to carry a load of 325 pounds, when inflated to 40 pounds per square inch.

(c) The manufacturers of casings must guarantee them to be free from defects in material and workmanship.

(d) Casings shall be plainly marked with manufacturer's name, serial number and size of tire.

(e) It is so soon as possible it is desired that all casings be marked with the equivalent metric sizes as recommended by the Society of Automotive Engineers.

2. TYPE. All casings manufactured in accordance with this specification shall be of the manufacturer's standard non-skid clincher type, designed for the S. A. E. clincher motorcycle CC rim of the size 28 by 3 inches.

3. CONSTRUCTION. (a) Splices on the first ply of fabric shall be gumstripped.

(b) Carcass of casing shall consist of four separate plies of tire fabric, with friction cords and skid coat on one side. The carcass of one ply frictioned on two sides and skid-coated on one shall be at least 0.048-inch. Each ply shall have not more than two splices which must be at least seven inches apart measured on the circumference of the casing.

(c) The splices in the casing shall be at least three inches apart when measured on the circumference of the casing.

(d) All fabric must be thoroughly dried according to standard manufacturing practice before it is started through the operations of rubberizing.

(e) The usual method of inspection used by tire companies in commercial practice to discover defects in casing of fabric shall be employed. All fabric shall be tested in an approved testing machine to determine the tensile strength in the following manner: the distance between the grips on the machine shall be approximately three inches, and the separation of the jaws shall be at the rate of 20 inches per minute. Six samples shall be cut from each roll in such a manner as to eliminate any unnecessary waste of material. Three samples shall be cut longitudinally to determine the warp strength and three samples shall be cut transversely to determine the filler strength. The samples shall be prepared in the following manner: unrolled to 23 inches (1-inch width) fabric shall be dried one hour and thirty minutes at 110 degrees C. Breaking test shall be completed within thirty seconds of time of removing test strip from oven. The results must show a tensile strength of not less than 165 pounds per inch width for either warp or filler.

(f) Beads shall be constructed with a core filler as in standard commercial practice.

(g) There shall be a cushion of rubber compound applied over the fabric which shall be wider than the breaker. The minimum gage of this cushion shall be 1/16 inch.

(h) Over the cushion there shall be at least one breaker strip of open-weave fabric such as is used in standard commercial practice, coated on both sides with a compound of the same nature as the cushion and tread of a nature to form a perfect union between the cushion and tread when the cure is effected. This breaker strip shall have a minimum width of 1½ inches. The breaker shall be made from standard cotton weighing not less than 8 ounces per square yard.

(i) The tread of the casing shall not be less than 1/16 inch thick in the center, 3/16 inch of which shall be the minimum thickness for that part of the tread in the middle of the non-skid portion.

(j) The sidewall of the casing shall have a minimum thickness of 0.045-inch.

4. PHYSICAL MEASUREMENTS AND TESTS. (a) Cross-sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. E. shall not be less than 2.15/16 inches nor more than 3/10 inches.

(b) Tires shall be capable of withstanding water pressure of 250 pounds per square inch without apparent injury. This test to be made at the discretion of the inspector.

(c) The strength of the union between plies of fabric shall average 16 pounds or more per inch using the standard friction test, viz., a section of tire shall be cut one inch up with the measured circumference. The plies are to be started and pulled down two inches at one bead, which head is to be clamped in the jaws of standard friction testing machine.

(d) Strength of the union between cushion and carcass shall be not less than 16 pounds per inch using the standard dead weight friction test as above provided.

(e) Strength of the union between sidewall and carcass shall be not less than 10 pounds per inch, using the standard dead weight friction test as above provided.

5. ROAD TESTS. Manufacturers bidding on government requirements must make the following conditions:

(a) Casings will not be given consideration unless the maker submitting the bid furnishes an affidavit stating that he has measured and certified to maintain at least one motorcycle used exclusively for test work, and that this same machine averages at least 1,000 machine miles per machine per week.

(b) The speeds, loads, tire sizes, inflations and road conditions must be such that the casings are properly tested. The Government may appoint an inspector to see that the above conditions are complied with.

(c) A bidder is to submit a sample of the casing to be submitted to the Government, stating that the casings to be delivered are the same cross-section and practically duplicate, in construction and material, as the one which he has previously tested in accordance with paragraphs (a) and (b) and a sufficient number of casings satisfactory to the Government, not less than six, have averaged on the wear wheels at least 4,000 miles.

6. LINING. The inside of each casing shall be properly lined in accordance with the standard practice of the tire manufacturers.

7. FLAPS. Each casing shall have a flap centered inside of the casing in accordance with standard commercial practice.

8. COMPOUNDS. (a) Tread.—The tread shall be made from and have the characteristics of a compound containing at least 65 per cent by volume of the best quality new wild or plantation rubber. Compound shall be free from ingredients known to the rubber trade as oil substitutes and/or reclaimed rubber. The minimum tensile strength shall be 2,000 pounds per square inch with a minimum elongation of 450 per cent (2 to 11 inches), as determined by the average of four test pieces, each stretched at the rate of 20 inches per minute. The test pieces shall be cut longitudinally and shall be $\frac{1}{4}$ -inch wide over a gage length of two inches, the ends being gradually enlarged to a width of approximately one inch. The permanent set determined by the average of four tests with the test pieces as above shall not exceed 25 per cent after an elongation of 400 per cent (2 to 10 inches) for ten minutes followed by a rest of ten minutes. All tests shall be made at a temperature between 65 and 90 degrees F.

(b) Friction and Cushion.—These shall be made from and have the characteristics of a compound containing at least 75 per cent by volume of the best quality new wild or plantation rubber. The compound shall be free of ingredients known to the rubber trade as oil substitutes and/or reclaimed rubber.

(c) Sidewall.—The sidewall shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality new wild or plantation rubber. Reclaimed rubber to the extent of 15 per cent by weight of total compound is allowed, but the amount and kind must be declared by the manufacturer. Compound shall have a minimum tensile strength of 1,500 pounds per square inch and a minimum elongation of 450 per cent (2 to 11 inches) and a maximum set of 25 per cent, tested as specified in 8(a). The compound shall be free of ingredients known to the rubber trade as oil substitutes.

(d) All test pieces must be cut transversely to the direction of travel. The Government reserves the right to make any inspection, test or analysis necessary to insure the product meeting all requirements of this specification.

9. WRAPPING AND MARKING. All casings shall be spirally wrapped according to standard practice and properly labeled on the outside showing the size and type, and name of manufacturer. A label with the month and year of manufacture stamped on it shall be pasted in a conspicuous place.

11. PACKING. Packing shall be as per specifications accompanying the request for bid.

PNEUMATIC MOTORCYCLE CASINGS (NON-SKID).

SIZE 29 BY $\frac{3}{4}$ INCHES.

FABRIC CONSTRUCTION.

Specification No. 1065A.

NOVEMBER 1, 1918.

1. GENERAL. (a) Pneumatic motorcycle casings manufactured in accordance with this specification shall be of fabric construction of the size known to the trade as 29 by $\frac{3}{4}$ inches.

(b) Casings must be designed to carry a load of 400 pounds when inflated to 45 pounds per square inch.

(c) The manufacturer of casings must guarantee them to be free from defects in material and workmanship.

(d) Casings shall be plainly marked with manufacturer's name, serial number and size of tire.

2. TYPE. All casings manufactured in accordance with this specification shall be of the manufacturer's standard non-skid clincher type, designed for the S. A. E. clincher motorcycle CC rim of the size 28 by 3 inches.

3. CONSTRUCTION. (a) Splices on the first ply of fabric shall be gum-stripped.

(b) Carcass of casing shall consist of four separate plies of tire fabric, with friction coat on two sides and skim coat on one side. The gage of one ply frictioned on two sides and skim-coated on one shall be at least 0.045-inch. Each ply shall have not more than two splices which must be at least seven inches apart measured on the circumference of the casing. The splices in the casing shall be at least three inches apart when measured on the circumference of the casing.

(c) All fabric must be square-woven (23 by 23) from Egyptian long-staple cotton or its physical equivalent as approved by the Government, weighing 17½ ounces to the square yard with an allowable variance of plus or minus 3 per cent.

(d) All fabric must be thoroughly dried according to standard manufacturing practice before it is started through the operations of rubberizing.

(e) The usual methods of inspection used by tire companies in commercial practice to discover defects in each roll of fabric shall be used. The fabric shall be tested in an approved testing machine to determine the tensile strength in the following manner: the distance between the grips on the machine shall be approximately three inches, and the separation of the jaws shall be at the rate of 20 inches per minute. Samples shall be cut from each roll in such a manner as to eliminate any unnecessary waste of material. Three samples shall be cut longitudinally to determine the tensile strength of the carcass and three samples shall be cut transversely to determine the filler strength. The samples shall be prepared in the following manner: unravel to 23 yards (1-inch width); fabric shall be dried one hour and thirty minutes at 113 degrees C. Breaking test shall be completed within thirty seconds of time of removing test strip from oven. The results must show a tensile strength of not less than 165 pounds per inch width for either warp or filler.

(f) Beads shall be constructed with a core filler as in standard commercial practice.

(g) One chafing strip of square-woven fabric weighing not less than 8 ounces per square yard shall be used on each side of the casing. The chafing strip shall extend upward on the side of the casing at least $\frac{3}{4}$ -inch from the channel of the bead.

(h) There shall be a cushion of rubber compound applied over the fabric which shall be wider than the breaker. The minimum gage of this cushion shall be 0.045-inch.

(i) Over the cushion there shall be at least one breaker strip of open-weave fabric such as is used in standard commercial practice, coated on both sides with a rubber compound having the physical properties of 2½ times that of a natural rubber to form a perfect union between the cushion and tread when the cure is effected. This breaker strip shall have a minimum width of 2½ inches. Breaker shall be made from long-staple cotton weighing not less than 8 ounces per square yard.

(j) The tread of the casing shall be not less than $\frac{5}{16}$ -inch thick in the center, $\frac{3}{16}$ -inch of which shall be the minimum thickness for that part of the tread under the middle of the non-skid portion.

(k) The sidewall of the casing shall have a minimum thickness of 0.050-inch.

4. PHYSICAL MEASUREMENTS AND TESTS. (a) Cross-sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. E. shall not be less than $3\frac{1}{16}$ inches.

(b) The casing shall be capable of withstanding water pressure of 275 pounds per square inch without apparent injury. This test is to be made at the discretion of the inspector.

(c) The strength of the union between plies of fabric shall average 16 pounds or more per inch, using the standard friction test, viz.: a section of the casing is to be cut one inch in width measured circumferentially. The plies are to be started and pulled apart two inches at a time, which head is to be clamped in the jaws of standard friction testing machine. The test shall be made on any ply of fabric in accordance with the standard draft weight friction test. The rate of separation shall not be more than one inch per minute.

(d) Strength of the union between the breaker and tread and between the breaker and cushion shall be at least 28 pounds per inch, using the standard draft weight friction test as above provided.

(e) Strength of the union between cushion and carcass shall be not less than 16 pounds per inch, using the standard draft weight friction test as above provided.

(f) Strength of union between sidewall and carcass shall be not less than 10 pounds per inch, using the standard draft weight friction test as above provided.

5. ROAD TEST. Manufacturers bidding on government requirements must meet the following conditions:

(a) Casings will not be given consideration unless the maker submitting the bid furnishes an affidavit stating that he has maintained and will maintain the standard of the standard draft weight friction test, will continue to maintain at least one motorcycle used for road test, will use at least one machine averaging at least 1,000 machine miles per machine per week.

(b) The speeds, loads, tire sizes, inflations and road conditions must be stated in the bid. The Government may appoint an inspector to see that the above conditions are complied with.

(c) A bidder must supply an affidavit before delivering any casings to the Government, stating that the casings to be delivered are the same cross-section and practically duplicate, in construction and material, casings which he has previously tested in accordance with paragraphs (a) and (b), and a sufficient number of casings satisfactory to the Government, not less than six, have averaged on the rear wheels at least 4,000 miles.

6. LIRING. The inside of each casing shall be properly lined in accordance with the standard practice of the tire manufacturers.

7. PLAYS. Each casing shall have a flap cemented into inside of the casing in accordance with standard commercial practice.

8. COMPOUNDS. (a) Tread.—The tread shall be made from and have the characteristics of a compound containing at least 65 per cent by volume of the best quality new wild or plantation rubber. Compound shall be free from ingredients known to the rubber trade as oil substitutes and/or reclaimed rubber. The minimum tensile strength shall be 2,000 pounds per square inch with a minimum elongation of 450 per cent (2 to 11 inches), as determined by the average of four test pieces when stretched at the rate of 20 inches per minute. The test pieces shall be cut longitudinally and shall be $\frac{1}{4}$ -inch wide over a gage length of two inches, the ends being gradually enlarged to a width of approximately one inch. The permanent set determined by the average of four tests with the test pieces as above shall not exceed 25 per cent after an elongation of 400 per cent (2 to 10 inches) for ten minutes, followed by a rest of ten minutes. All tests shall be made at a temperature between 65 and 90 degrees F.

(b) Friction and Cushion.—These shall be made from and have the characteristics of a compound containing at least 75 per cent by volume of the best quality new wild or plantation rubber. The compound shall be free of ingredients known to the rubber trade as oil substitutes and/or reclaimed rubber.

(c) Sidewall.—The sidewall shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality new wild or plantation rubber. Reclaimed rubber to the extent of 15 per cent by weight of total compound is allowed, but the amount and kind must be declared by the manufacturer. Compound shall have a minimum tensile strength of 1,500 pounds per square inch and a minimum elongation of 450 per cent (2 to 11 inches) and a maximum set of 25 per cent, tested as specified in 8(a). The compound shall be free of ingredients known to the rubber trade as oil substitutes.

(d) All test pieces must be cut from casings.

(e) As soon as possible it is desired that all casings be marked with the equivalent metric sizes as recommended by the Society of Automotive Engineers.

9. WRAPPING AND MARKING. All casings shall be spirally wrapped according to standard practice and properly labeled on the outside, showing the size and type, and name of manufacturer. A label with the month and year of manufacture stamped on it shall be pasted in a conspicuous place.

11. PACKING. Packing shall be as per specifications accompanying the request for bid.

PNEUMATIC AUTOMOBILE CASINGS (NON-SKID).

SIZE 30 BY $\frac{3}{4}$ INCHES.

FABRIC CONSTRUCTION.

Specification No. 1066A.

NOVEMBER 1, 1918.

1. GENERAL. (a) Pneumatic automobile casings manufactured in accordance with this specification shall be of fabric construction of the size known to the trade as 30 by $\frac{3}{4}$ inches.

(b) Casings must be designed to carry a load of 570 pounds when inflated to 45 pounds per square inch.

(c) The manufacturers of casings must guarantee them to be free from defects in material and workmanship.

(d) Casings shall be plainly marked with manufacturer's name, serial number and size of tire.

(e) As soon as possible it is desired that all casings be marked with the equivalent metric sizes as recommended by the Society of Automotive Engineers.

2. TYPE. All casings manufactured in accordance with this specification shall be of the manufacturer's standard non-skid clincher type, designed for the S. A. E. clincher rim of the size 30 by $\frac{3}{4}$ inches.

3. CONSTRUCTION. (a) Splices on the first ply of fabric shall be gum-stripped.

(b) Carcass of casing shall consist of not less than four nor more than five separate plies of tire fabric, with friction coat on two sides and skim coat on one side. The gage of one ply frictioned on two sides and skim coated on one shall be at least 0.045-inch. Each ply shall have not more than two splices, which must be at least seven inches apart measured on

be such that the casings are properly tested. The Government may appoint an inspector to see that the above conditions are complied with.

(c) A bidder must supply an affidavit before delivering any casings to the Government, stating that the casings to be delivered are the same as the Government and practically duplicate, in construction and material, casings which he has previously tested in accordance with paragraphs (a) and (b), and a sufficient number of casings satisfactory to the Government, in accordance with the Law of the Government.

6. **TENSILE.** The inside of each casing shall be properly lined in accordance with the standard practice of the tire manufacturers.

7. **PLIES.** No. 10.

8. **COMPOUNDS.** (a) Tread.—The tread shall be made from and have the characteristics of a compound containing at least 65 per cent by volume of the best quality new wild or plantation rubber. Compound shall be free from ingredients known to the rubber trade as oil substitutes. (b) Sidewall.—The sidewall shall be made from and have the characteristics of a compound containing at least 75 per cent by volume of the best quality new wild or plantation rubber. The compound shall be free of ingredients known to the rubber trade as oil substitutes and/or reclaimed rubber.

(c) Sidewall.—The sidewall shall be made from and have the characteristics of a compound containing at least 65 per cent by volume of the best quality new wild or plantation rubber. Reclaimed rubber to the extent of 15 per cent by weight of total compound is allowed, but the compound and kind must be declared on the invoice. Compound shall have a minimum tensile strength of 1,500 pounds per square inch and a minimum elongation of 450 per cent (2 to 11 inches) as determined by the average of four test pieces taken stretched at the rate of 20 inches per minute. The test pieces shall be cut longitudinally and shall be 1/4 inch wide over a core length of two inches, the ends being gradually enlarged to a width of approximately one inch. The permanent set determined by the average of four tests with the test pieces as above shall not exceed 25 per cent after elongation of 400 per cent (2 to 10 inches) for ten minutes, followed by a rest of ten minutes. All tests shall be made at a temperature between 65 and 90 degrees F.

(d) Friction and Cushion.—These shall be made from and have the characteristics of a compound containing at least 75 per cent by volume of the best quality new wild or plantation rubber. The compound shall be free of ingredients known to the rubber trade as oil substitutes and/or reclaimed rubber.

(e) All test pieces must be cut from casings.

9. **INSPECTION.** The Government reserves the right to make any inspection, test or analysis necessary to insure the product meeting all requirements of this specification.

10. **WRAPPING AND MARKING.** All casings shall be spirally wrapped according to standard practice and properly labeled on the outside, showing the size and type, and name of manufacturer. A label with the month and year of manufacture stamped on it shall be pasted in a conspicuous place.

11. **PACKING.** Packing shall be as per specifications accompanying the request for bid.

PNEUMATIC AUTOMOBILE CASINGS (RIBBED OR NON-SKID).

SIZE 33 BY 4 INCHES.

CORD CONSTRUCTION.

Specification No. 1069A.

NOVEMBER 1, 1918.

1. **GENERAL.** (a) Pneumatic automobile casings manufactured in accordance with this specification shall be of cord construction, of the size known to the trade as 33 by 4 inches.

(b) Casings must be designed to carry a load of 815 pounds when inflated to 75 pounds per square inch.

(c) The manufacturer of casings must guarantee them to be free from defects in material and workmanship.

(d) Casings shall be plainly marked with manufacturer's name, serial number and size of tire.

(e) As soon as possible, it is desired that all casings be marked with the equivalent metric sizes as recommended by the Society of Automotive Engineers.

2. **TYPE.** All casings manufactured in accordance with this specification shall be of the manufacturer's standard non-skid or ribbed (as ordered) straight side type designed for the standard S. A. E. straight side rim of the size 33 by 4 inches and the casing have a minimum width of 2 1/4 inches.

3. **CONSTRUCTION.** (a) Carcass of casing shall consist of not less than four nor more than eight separate plies of cord applied in such a manner that an equal number of plies shall run in each diagonal direction across the casing.

(b) All cord material to be of the best quality combed Sea Island or Salsarules cotton or their physical equivalent as approved by the Government.

(c) All cord fabric must be thoroughly dried according to standard manufacturing practice before it is started through the operation of rubberizing.

(d) The usual methods of inspection used by tire companies in commercial practice to discover defects in each roll of cord fabric shall be employed, and tests to determine tensile strength of cords shall be made on ten individual cords taken from each roll. The results shown must be up to the standard specified by the tire manufacturer.

(e) Two chaining strips of fabric weighing not less than eight ounces per square yard, shall be used on each side of the casing. Each chaining strip shall extend upward on the side of the casing at least 1 1/8 inches from the heel of the bead. One chaining strip shall extend at least 3/16 inch above the other.

(f) There shall be a cushion of rubber compound applied over the cords which shall be wider than the breaker. The minimum gage of this cushion shall be 0.050 inch.

(g) Over the cushion there shall be at least one breaker strip of open-weave fabric such as used in standard commercial practice, coated on both sides with a rubber compound having the physical and chemical properties of a nature to form a perfect union between the cushion and tread when the cure is effected. The breaker strip shall have a minimum width of 2 1/4 inches. Breaker shall be made from long-staple Egyptian cotton or its physical equivalent as approved by the Government and shall be much not less than ten ounces per square yard.

(h) The tread of the casing shall not be less than 3/4 inch thick in the center, 3/4 inch of which shall be the minimum thickness for that part of the tread under the non-skid portion.

(i) The sidewall of the casing shall have a minimum thickness of 0.0625 inch.

4. **PHYSICAL MEASUREMENTS AND TESTS.** (a) Cross-sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. E. shall be not less than 4.2 inches.

(b) Tires shall be capable of withstanding water pressure of 350 pounds per square inch without apparent injury. This test is to be made at the discretion of the inspector.

(c) The minimum strength of the casing shall be 2,000 pounds. This "strength factor" is the product of the number of cords per inch measured at the tread at right angles to the cords and the number of cords per inch measured at right angles from the cords. The result is multiplied by the number of plies.

(d) The strength of the union between breaker and tread and between breaker and cushion shall be not less than 32 pounds per inch, using the standard dead weight friction test as provided in paragraph No. 4, fabric casing specifications.

(e) The strength of the union between sidewall and plies shall average 14 pounds of more per inch, using the standard dead weight friction test as above provided.

(f) The strength of the union between cushion and plies shall average 16 pounds of more per inch, using the standard dead weight friction test as above provided.

5. **TESTS.** A flap shall be furnished with each casing, as in standard commercial practice.

6. **COMPOUNDS.** (a) Tread.—The tread shall be made from and have the characteristics of a compound containing at least 70 per cent by volume of the best quality new wild or plantation rubber. The minimum tensile strength shall be 400 pounds to the square inch, with a minimum elongation of 500 per cent (2 to 12 inches) as determined by the average of four test pieces taken stretched at the rate of 30 inches per minute. The test pieces shall be cut longitudinally and shall be 1/4 inch wide over a core length of two inches, the ends being gradually enlarged to a width of approximately one inch. The permanent set determined by the average of four tests with the test pieces as above shall not exceed 25 per cent after elongation of 400 per cent (2 to 10 inches) for ten minutes, followed by a rest of ten minutes. All tests shall be made at a temperature between 65 and 90 degrees F.

(b) Friction and Cushion.—These shall be made from and have the characteristics of a compound containing at least 85 per cent by volume of the best quality new wild or plantation rubber. The compound shall be free of ingredients known to the rubber trade as oil substitutes and/or reclaimed rubber.

(c) Sidewall.—The sidewall shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality new wild or plantation rubber. Reclaimed rubber to the extent of 15 per cent by weight of total compound is allowed, but the compound and kind must be declared on the invoice. Compound shall have a minimum tensile strength of 1,500 pounds per square inch and a minimum elongation of 450 per cent (2 to 11 inches). The permanent set shall not exceed 25 per cent after elongation of 400 per cent (2 to 10 inches) for ten minutes, followed by a rest of ten minutes. All tests shall be made at a temperature between 65 and 90 degrees F.

(d) All above test pieces must be cut from casings.

(e) The above compounds shall be free of ingredients known to the rubber trade as oil substitutes and/or reclaimed rubber.

9. **INSPECTION.** The Government reserves the right to make any inspection, test or analysis necessary to insure the product meeting all requirements of this specification.

10. **WRAPPING AND MARKING.** All casings shall be spirally wrapped according to standard practice and properly labeled on its outside, showing the size and type, and name of manufacturer. A label with the month and year of manufacture stamped on it shall be pasted in a conspicuous place.

11. **PACKING.** Packing shall be as per specifications accompanying the request for bid.

PNEUMATIC AUTOMOBILE CASINGS (RIBBED OR NON-SKID).

SIZE 35 BY 5 INCHES.

CORD CONSTRUCTION.

Specification No. 1069A.

NOVEMBER 1, 1918.

1. **GENERAL.** (a) Pneumatic automobile casings manufactured in accordance with this specification shall be of cord construction, of the size known to the trade as 35 by 5 inches.

(b) Casings must be designed to carry a load of 1,500 pounds when inflated to 75 pounds per square inch.

(c) The manufacturer of casings must guarantee them to be free from defects in material and workmanship.

(d) Casings shall be plainly marked with manufacturer's name, serial number and size of tire.

(e) As soon as possible, it is desired that all casings be marked with the equivalent metric sizes as recommended by the Society of Automotive Engineers.

2. **TYPE.** All casings manufactured in accordance with this specification shall be of the manufacturer's standard non-skid or ribbed (as ordered) straight side type designed for the standard S. A. E. straight side rim of the size 35 by 5 inches and the casing have a minimum width of 2 1/4 inches.

3. **CONSTRUCTION.** (a) Carcass of casing shall consist of not less than four nor more than ten separate plies of cord applied in such a manner that an equal number of plies shall run in each diagonal direction across the casing.

(b) All cord material to be of the best quality combed Sea Island or Salsarules cotton or their physical equivalent as approved by the Government.

(c) All cord fabric must be thoroughly dried according to standard manufacturing practice before it is started through the operations of rubberizing.

(d) The usual methods of inspection used by tire companies in commercial practice to discover defects in each roll of cord fabric shall be employed, and tests to determine tensile strength of cords shall be made on ten individual cords taken from each roll. The results shown must be up to the standard specification of the individual manufacturer.

(e) Two chaining strips of fabric weighing not less than eight ounces per square yard, shall be used on each side of the casing. Each chaining strip shall extend upward on the side of the casing at least 1 1/8 inches from the

heel of the bead. One chafing strip shall extend at least 3/16-inch above the other.

(d) There shall be a cushion of rubber compound applied over the cords which shall be wider than the breaker. The minimum gage of this cushion shall be 0.0625-inch.

(e) Over the cushion there shall be at least one breaker strip of open-weave fabric such as is used in standard commercial practice, coated on both sides with a rubber compound having the physical and chemical properties of a nature to form a perfect union between the cushion and tread when the cure is effected. This breaker strip shall have a minimum width of 3 1/2 inches. Breaker shall be made from long-staple Egyptian cotton or its physical equivalent as approved by the Government and shall weigh not less than ten ounces per square yard.

(f) The tread of the casing shall not be less than 7/16-inch thick in the center, 3/16-inch at the sides. The breaker strip shall have a minimum thickness for that part of the tread under the middle of the non-skid portion of 350 pounds per square inch without apparent injury. This test is to be made at the discretion of the inspector.

(g) The sidewall of the casing shall have a minimum thickness of 0.0625-inch.

4. PHYSICAL MEASUREMENTS AND TESTS. (a) Cross-sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. E. shall be not less than 5.4 inches.

(b) Tires shall be capable of withstanding water pressure of 350 pounds per square inch without apparent injury. This test is to be made at the discretion of the inspector.

(c) The minimum strength of the casing shall be 2,500 pounds. This "strength factor" is the product of the number of cords per inch measured at the tread at right angles to the cords, multiplied by the strength of the individual cord as taken from the cord casing, multiplied by the number of plies.

(d) The strength of the union between breaker and tread and between breaker and cushion shall be not less than 32 pounds per inch, using the standard dead weight friction test as provided in paragraph No. 4, fabric casing specifications.

(e) Strength of the union between sidewall and plies shall average 14 pounds or more per inch, using the standard dead weight friction test as above provided.

(f) Strength of the union between cushion and plies shall average 16 pounds or more per inch, using the standard dead weight friction test as above provided.

5. ROAD TEST. Manufacturers bidding on government requirements must make the following conditions:

(a) Casings will not be given consideration unless the maker submitting the bid furnishes an affidavit stating that he has maintained and will continue to maintain at least two cars used exclusively for test work, and that these cars average at least 1,000 car miles per car per week.

(b) The speeds, loads, tire sizes, inflation and road conditions must be such that the casings are properly tested. The Government may appoint an inspector to see that the above conditions are complied with.

(c) A bidder must supply an affidavit before delivering any casings to the Government, stating that the casings to be delivered are the same cross-section and practically duplicate, in construction and material, casings which he has previously tested in accordance with paragraphs (a) and (b), and a sufficient number of casings to supply to the Government, not less than six, have averaged on the rear wheels at least 5,000 miles.

6. LINING. The inside of each casing shall be properly lined in accordance with the standard practice of the Government.

7. FLAPS. A flap shall be furnished with each casing, as in standard commercial practice.

8. CONSTRUCTION. (a) Tread.—The tread shall be made from and have the characteristics of a compound containing at least 70 per cent by volume of the best quality new wild or plantation rubber. The minimum tensile strength shall be 500 per cent (2 to 12 inches) as determined by the average of four test pieces when stretched at the rate of 20 inches per minute. The test pieces shall be cut longitudinally and shall be gradually enlarged to a width of approximately one inch. The permanent set determined by the average of four tests with test pieces as above, shall not exceed 25 per cent after an elongation of 400 per cent (2 to 10 inches) for ten minutes, followed by a rest of ten minutes. All tests shall be made at a temperature between 65 and 90 degrees F.

(b) Friction and Cushion.—These shall be made from and have the characteristics of a compound containing at least 85 per cent by volume of the best quality new wild or plantation rubber.

(c) Sidewall.—The sidewall shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality new wild or plantation rubber. The minimum tensile strength shall be 500 per cent (2 to 11 inches) and a minimum elongation of 450 per cent (2 to 11 inches). The permanent set shall not exceed a maximum of 25 per cent, tested as specified in 8(a).

(d) The above compounds shall be free of ingredients known to the rubber trade as oil substitutes and/or reclaimed rubber.

9. INSPECTION. The Government reserves the right to make any inspection, test or analysis necessary to insure the product meeting all requirements of this specification.

10. WRAPPING AND MARKING. All casings shall be spirally wrapped according to standard practice and properly labeled on the outside showing the size and type, and name of manufacturer. A label with the month and year of manufacture stamped on it shall be pasted in a conspicuous place.

11. PACKING. Packing shall be as per specifications accompanying the request for bid.

PNEUMATIC AUTOMOBILE CASINGS (RIBBED OR NON-SKID).

SIZE 36 BY 6 INCHES.

CORD CONSTRUCTION.

Specification No. 1070A.

NOVEMBER 1, 1918.

1. GENERAL. (a) Pneumatic automobile casings manufactured in accordance with this specification shall be of cord construction, of the size known to the trade as 36 by 6 inches.

(b) Casings must be designed to carry a load of 2,000 pounds when inflated to 90 pounds per square inch.

(c) The manufacturer of the casings must guarantee them to be free from defects in material and workmanship.

(d) Casings shall be plainly marked with manufacturer's name, serial number and size of tire. As soon as possible, it is desired that all casings be marked with the equivalent metric sizes as recommended by the Society of Automotive Engineers.

2. TYPE. All casings manufactured in accordance with this specification shall be of the manufacturer's standard non-skid or ribbed (as ordered) straight side type designed for the standard S. A. E. straight side rim of the type used by 6 inches.

3. CONSTRUCTION. (a) Carcass of casings shall consist of not less than four nor more than twelve separate plies of cord applied in such a manner that the total number of plies shall run in each diagonal direction across the casing.

(b) All cord material to be of the best quality combed Sae Island or Salarabais cotton or their physical equivalent as approved by the Government.

(c) All cord fabric must be thoroughly dried according to standard manufacturing practice before it is started through the operations of rubberizing.

(d) The usual methods of inspection used by tire companies in commercial practice shall be employed, and tests to determine tensile strength of cords shall be made on ten individual cords taken from each roll. The results shown must be up to the standard specification for standard commercial practice.

(e) Two chafing strips of fabric weighing not less than eight ounces per square yard shall be used on each side of the casing. Each chafing strip shall extend upward on the side of the casing at least 1 1/2 inches from the heel of the bead. One chafing strip shall extend at least 1/2-inch above the other.

(f) There shall be a cushion of rubber compound applied over the cords which shall be wider than the breaker. The minimum gage of this cushion shall be 0.080-inch.

(g) Over the cushion there shall be at least one breaker strip of open-weave fabric such as is used in standard commercial practice, coated on both sides with a rubber compound having the physical and chemical properties of a nature to form a perfect union between the cushion and tread when the cure is effected. This breaker strip shall have a minimum width of 4 1/2 inches. Breaker shall be made from long-staple Egyptian cotton or its physical equivalent as approved by the Government and shall weigh not less than ten ounces per square yard.

(h) The tread of the casing shall not be less than 9/16-inch thick in the center, 7/32-inch of which shall be the minimum thickness for that part of the tread under the middle of the non-skid portion of 350 pounds per square inch without apparent injury. This test is to be made at the discretion of the inspector.

(i) The sidewall of the casing shall have a minimum thickness of 0.0625-inch.

4. PHYSICAL MEASUREMENTS AND TESTS. (a) Cross-sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. E. shall be not less than 6.3 inches.

(b) Tires shall be capable of withstanding water pressure of 350 pounds per square inch without apparent injury. This test is to be made at the discretion of the inspector.

(c) The minimum strength of the casing shall be 3,000 pounds. This "strength factor" is the product of the number of cords per inch measured at the tread at right angles to the cords, multiplied by the strength of the individual cord as taken from the cord casing, multiplied by the number of plies.

(d) The strength of the union between breaker and tread and between breaker and cushion shall be not less than 32 pounds per inch, using the standard dead weight friction test as provided in paragraph No. 4, fabric casing specifications.

(e) Strength of the union between sidewall and plies shall average 14 pounds or more per inch, using the standard dead weight friction test as above provided.

(f) Strength of the union between cushion and plies shall average 16 pounds or more per inch, using the standard dead weight friction test as above provided.

5. ROAD TEST. Manufacturers bidding on government requirements must make the following conditions:

(a) Casings will not be given consideration unless the maker submitting the bid furnishes an affidavit stating that he has maintained and will continue to maintain at least two cars used exclusively for test work, and that these cars average at least 500 car miles per car per week.

(b) The speeds, loads (which may be of merchandise), tire sizes, inflation and road conditions must be such that the casings are properly tested. The Government may appoint an inspector to see that the above conditions are complied with.

(c) A bidder must supply an affidavit before delivering any casings to the Government, stating that the casings to be delivered are the same cross-section and practically duplicate, in construction and material, casings which he has previously tested in accordance with paragraphs (a) and (b), and a sufficient number of casings to supply to the Government, not less than four, have averaged on the rear wheels at least 5,000 miles.

6. LINING. The inside of each casing shall be properly lined in accordance with the standard practice of the Government.

7. FLAPS. A flap shall be furnished with each casing, as in standard commercial practice.

8. CONSTRUCTION. (a) Tread.—The tread shall be made from and have the characteristics of a compound containing at least 70 per cent by volume of the best quality new wild or plantation rubber. The minimum tensile strength shall be 500 per cent (2 to 12 inches) as determined by the average of four test pieces when stretched at the rate of 20 inches per minute. The test pieces shall be cut longitudinally and shall be gradually enlarged to a width of approximately one inch. The permanent set determined by the average of four tests with test pieces as above, shall not exceed 25 per cent after an elongation of 400 per cent (2 to 10 inches) for ten minutes, followed by a rest of ten minutes. All tests shall be made at a temperature between 65 and 90 degrees F.

(b) Friction and Cushion.—These shall be made from and have the characteristics of a compound containing at least 85 per cent by volume of the best quality new wild or plantation rubber.

(c) Sidewall.—The sidewall shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality new wild or plantation rubber. The minimum tensile strength shall be 500 per cent (2 to 11 inches) and a minimum elongation of 450 per cent (2 to 11 inches). The permanent set shall not exceed a maximum of 25 per cent, tested as specified in 8(a).

(d) The above compounds shall be free of ingredients known to the rubber trade as oil substitutes and/or reclaimed rubber.

9. INSPECTION. The Government reserves the right to make any inspection, test or analysis necessary to insure the product meeting all requirements of this specification.

10. WRAPPING AND MARKING. All casings shall be spirally wrapped according to standard practice and properly labeled on the outside, showing the size and type, and name of manufacturer. A label with the month and

year of manufacture stamped on it shall be pasted in a conspicuous place.

11. **PACKING.** Packing shall be as per specifications accompanying the request for bid.

PNEUMATIC AUTOMOBILE CASINGS (RIBBED OR NON-SKID).

SIZE 38 BY 7 INCHES.

CORD CONSTRUCTION.

Specification No. 1071A.

NOVEMBER 1, 1918.

1. **GENERAL.** (a) Pneumatic automobile casings manufactured in accordance with this specification shall be of cord construction, of the size known to the trade as 38 by 7 inches.

(b) Casings must be designed to carry a load of 2,700 pounds when inflated to 100 pounds per square inch.

(c) The manufacturer of casings must guarantee them to be free from defects in material and workmanship.

(d) Casings shall be plainly marked with manufacturer's name, serial number and size of tire.

(e) As soon as possible, it is desired that all casings be marked with the equivalent metric sizes as recommended by the Society of Automotive Engineers.

2. **TYPE.** All casings manufactured in accordance with this specification shall be of the manufacturer's standard non-skid or ribbed (as ordered) straight side type designed for the standard S. A. E. straight side rim of the size 38 by 7 inches.

3. **CONSTRUCTION.** (a) Carcass of casing shall consist of not less than four nor more than fourteen separate plies of cord applied in such a manner that an equal number of plies shall run in each diagonal direction across the casing.

(b) All cord material to be of the best quality combed Sea Island or Sakellarides cotton or their physical equivalent as approved by the Government.

(c) All cord fabric must be thoroughly dried according to standard manufacturing practice before it is started through the operation of rubberizing.

(d) The usual methods of inspection used by tire companies in commercial practice to discover defects in each roll of cord fabric shall be employed, and tests to determine tensile strength of cords shall be made on ten individual cords taken from each roll. The results shown must be up to the standard specification of the individual manufacturer.

(e) Two chafing strips of fabric weighing not less than twelve ounces per square yard, shall be used on each side of the casing. Each chafing strip shall extend upward on the side of the casing at least 1 1/4 inches from the level of the bead. One chafing strip shall extend at least 3/4 inch above the other.

(f) There shall be a cushion of rubber compound applied over the cords which shall be wider than the breaker. The minimum gauge of this cushion shall be 0.090-inch.

(g) Over the cushion there shall be at least one breaker strip of open-weave fabric such as is used in standard commercial practice, coated on both sides with a rubber compound having the physical and chemical properties of a nature to form a perfect union between the cushion and tread when the cure is effected. This breaker strip shall have a minimum width of 5 1/2 inches. Breaker shall be made from long-staple Egyptian cotton or their physical equivalent as approved by the Government and shall weigh not less than eighteen ounces per square yard.

(h) The tread of the casing shall not be less than 3/4-inch thick in the center, 1/2-inch of which shall be the minimum thickness for that part of the tread under the middle of the non-skid portion.

(i) The sidewall of the casing shall have a minimum thickness of 0.0625-inch.

4. **PHYSICAL MEASUREMENTS AND TESTS.** (a) Cross-sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. E. shall be not less than 7.35 inches.

(b) Tires shall be capable of withstanding water pressure of 350 pounds per square inch without apparent injury. This test is to be made at the discretion of the inspector.

(c) The minimum strength of the casing shall be 3,500 pounds. This "strength factor" is the product of the number of cords per inch measured at the tread at right angles to the cords, multiplied by the strength of the individual cord as taken from the cord casing, multiplied by the number of plies.

(d) The strength of the union between breaker and tread and between breaker and cushion shall be not less than 32 pounds per inch using the standard dead weight friction test as provided in paragraph No. 4, fabric casing specifications.

(e) Strength of the union between sidewall and right friction test as pounds or more per inch, using the standard dead weight friction test as above provided.

(f) Strength of the union between cushion and plies shall average 16 pounds or more per inch, using the standard dead weight friction test as above provided.

5. **ROAD TEST.** Manufacturers bidding on government requirements must meet the following conditions:

(a) Casings will not be given consideration unless the maker submitting the bid furnishes an affidavit stating that he has maintained, and will continue to maintain at least two cars used exclusively for test work, and that these cars average at least 500 car miles per car per week.

(b) The speeds, loads (which may be of merchandise), tire sizes, inflations and road conditions must be such that the casings are properly stressed. The Government may appoint an inspector to see that the above conditions are complied with.

(c) A bidder must supply an affidavit before delivering any casings to the Government stating that the casings to be delivered are the same cross-section and practically duplicate, in construction and material, casings which he has previously tested in accordance with paragraphs (a) and (b), and sufficient number of casings satisfactory to the Government, not less than four, have averaged on the rear wheels at least 5,000 miles.

6. **LINING.** The inside of each casing shall be properly lined in accordance with the standard practice of tire manufacturing.

7. **FLAPS.** A flap shall be furnished with each casing, as in standard commercial practice.

8. **COMPOUNDS.** (a) **Tread.**—The tread shall be made from and have the characteristics of a compound containing at least 70 per cent by volume of the best quality new wild or plantation rubber. The minimum tensile strength shall be 400 pounds to the square inch, with a minimum elongation of 500 per cent (2 to 12 inches) as determined by the average of four test pieces when stretched at the rate of 30 inches per minute. The test pieces shall be cut longitudinally and shall be 1/4-inch wide over a gauge length of 2 inches, the ends being gradually enlarged to a width of approximately one inch. The permanent set determined by the average of four tests with the test pieces as above shall not exceed 25 per cent after a minimum elongation of 400 per cent (2 to 10 inches). The permanent set shall not exceed a maximum of 25 per cent, tested as specified in 8(a).

(b) **Friction and Cushion.**—These shall be made from and have the characteristics of a compound containing at least 85 per cent by volume of the best quality new wild or plantation rubber.

(c) **Sidewall.**—The sidewall shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality new wild or plantation rubber. The compound shall have a minimum tensile strength of 1,500 pounds per square inch and a minimum elongation of 450 per cent (2 to 11 inches). The permanent set shall not exceed a maximum of 25 per cent, tested as specified in 8(a).

(d) All above test pieces must be cut from casings.

(e) The above compounds shall be free of ingredients known to the rubber trade as oil substitutes and/or reclaimed rubber.

9. **INSPECTION.** The Government reserves the right to make any inspection, test or analysis necessary to insure the product meeting all requirements of this specification.

10. **WRAPPING AND MARKING.** All casings shall be spirally wrapped according to standard practice and properly labeled on the outside showing the size and type, and name of manufacturer. A label with the month and year of manufacture stamped on it shall be pasted in a conspicuous place.

11. **PACKING.** Packing shall be as per specifications accompanying the request for bid.

PNEUMATIC AUTOMOBILE CASINGS (RIBBED OR NON-SKID).

SIZE 40 BY 8 INCHES.

CORD CONSTRUCTION.

Specification No. 1072A.

NOVEMBER 1, 1918.

1. **GENERAL.** (a) Pneumatic automobile casings manufactured in accordance with this specification shall be of cord construction of the size known to the trade as 40 by 8 inches.

(b) Casings must be designed to carry a load of 3,650 pounds when inflated to 110 pounds per square inch.

(c) The manufacturer of casings must guarantee them to be free from defects in material and workmanship.

(d) Casings shall be plainly marked with manufacturer's name, serial number and size of tire.

(e) As soon as possible, it is desired that all casings be marked with the equivalent metric sizes as recommended by the Society of Automotive Engineers.

2. **TYPE.** All casings manufactured in accordance with this specification shall be of the manufacturer's standard non-skid or ribbed (as ordered) straight side type designed for the standard S. A. E. straight side rim of the size 40 by 8 inches.

3. **CONSTRUCTION.** (a) Carcass of casing shall consist of not less than four nor more than sixteen separate plies of cord applied in such a manner that an equal number of plies shall run in each diagonal direction across the casing.

(b) All cord material to be of the best quality combed Sea Island or Sakellarides cotton or their physical equivalent as approved by the Government.

(c) All cord fabric must be thoroughly dried according to standard manufacturing practice before it is started through the operations of rubberizing.

(d) The usual methods of inspection used by tire companies in commercial practice to discover defects in each roll of cord fabric shall be employed, and tests to determine tensile strength of cords shall be made on ten individual cords taken from each roll. The results shown must be up to the standard specification of the individual manufacturer.

(e) Two chafing strips of fabric weighing not less than twelve ounces per square yard, shall be used on each side of the casing. Each chafing strip shall extend upward on the side of the casing at least two inches from the level of the bead. One chafing strip shall extend at least 3/4-inch above the other.

(f) There shall be a cushion of rubber compound applied over the cords which shall be wider than the breaker. The minimum gauge of this cushion shall be 0.090-inch.

(g) Over the cushion there shall be at least one breaker strip of open-weave fabric such as is used in standard commercial practice, coated on both sides with a rubber compound having the physical and chemical properties of a nature to form a perfect union between the cushion and tread when the cure is effected. This breaker strip shall have a minimum width of 6 1/2 inches. Breaker shall be made from long-staple Egyptian cotton or their physical equivalent as approved by the Government and shall weigh not less than eighteen ounces per square yard.

(h) The tread of the casing shall not be less than 1 1/16-inch thick in the center, 1-inch of which shall be the minimum thickness for that part of the tread under the middle of the non-skid portion.

(i) The sidewall of the casing shall have a minimum thickness of 0.0625-inch.

4. **PHYSICAL MEASUREMENTS AND TESTS.** (a) Cross-sectional diameter of each tire inflated according to the recommended weight and load schedule of the S. A. E. shall be not less than 8.4 inches.

(b) Tires shall be capable of withstanding water pressure of 350 pounds per square inch without apparent injury. This test is to be made at the discretion of the inspector.

(c) The minimum strength of the casing shall be 4,000 pounds. This "strength factor" is the product of the number of cords per inch measured at the tread at right angles to the cords, multiplied by the strength of the individual cord as taken from the cord casing, multiplied by the number of plies.

(d) The strength of the union between breaker and tread and between breaker and cushion shall be not less than 32 pounds per inch using the standard dead weight friction test as provided in paragraph No. 4, fabric casing specifications.

(e). Strength of the union between sidewall and plies shall average 14 pounds or more per inch, using the standard dead weight friction test as above provided.

(f). Strength of the union between cushion and plies shall average 16 pounds or more per inch, using the standard dead weight friction test as above provided.

5. **ROAD TEST.** Manufacturers bidding on government requirements must submit the following conditions:

(a). Casings will not be given consideration unless the maker submitting the bid furnishes an affidavit stating that he has maintained and will continue to maintain at least 500 miles per car wheel exclusively for test work, and that these cars average at least 500 miles per car wheel.

(b). The speeds, loads (which may be of merchandise), tire sizes, inflations and road conditions must be such that the casings are properly tested. The Government may appoint an inspector to see that the above conditions are complied with.

(c). A bidder must supply an affidavit before delivering any casings to the Government, stating that the casings to be delivered are of the same cross-section and practically duplicate, in construction and material, casings which he has previously tested in accordance with paragraphs (a) and (b), and a sufficient number of casings satisfactory to the Government, not less than four, have averaged on the rear wheels at least 5,000 miles.

6. **LINING.** The inside of each casing shall be properly lined in accordance with the standard practice of tire manufacturers.

7. **FLAPS.** A flap shall be furnished with each casing, as in standard commercial practice.

(a). **Tread.**—The tread shall be made from and have the characteristics of a compound containing at least 70 per cent by volume of the best quality new wild or plantation rubber. The minimum tensile strength shall be 1,500 pounds per square inch, with a minimum elongation of 500 per cent (2 to 12 inches) as determined by the average of four test pieces when stretched at the rate of 20 inches per minute. The test pieces shall be 1/2 inch wide, 1/4 inch thick and 4 inches long. The length of two inches, the ends being gradually enlarged to a width of approximately one inch. The permanent set determined by the average of four tests with a tensile force of 50 pounds shall not exceed 10 per cent. The elongation of 400 per cent (2 to 10 inches) for ten minutes, followed by a rest of ten minutes. All tests shall be made at a temperature between 65 and 80 degrees F.

(b). **Friction and Cushion.**—These shall be made from and have the characteristics of a compound containing at least 85 per cent by volume of the best quality new wild or plantation rubber.

(c). **Sidewall.** The sidewall shall be made from and have the characteristics of a compound containing a minimum of 65 per cent by volume of the best quality new wild or plantation rubber. The minimum tensile strength shall be 1,500 pounds per square inch and a minimum elongation of 450 per cent (2 to 11 inches). The permanent set shall not exceed a maximum of 25 per cent, tested as specified in 8(a).

(d). **Reclaim.** All above test pieces shall be made of reclaim.

(e). The above compounds shall be free of ingredients known to the rubber trade as oil substitutes and/or reclaimed rubber.

8. **INSPECTION.** The Government reserves the right to make any inspection, test or analysis necessary to insure the product meeting all requirements of this specification.

9. **WRAPPING AND MARKING.** All casings shall be spirally wrapped according to standard practice and properly labeled on the outside showing the size and type, and name of manufacturer. A label with the month and year of manufacture and a sample of the finished unvulcanized stock.

10. **PACKING.** Packing shall be as per specifications accompanying the request for bid.

SOLID MOTOR TIRES.

Specification No. 10718.

NOVEMBER 1, 1918.

1. **TYPE.** The tires to be furnished shall be "pressed on" type, provided with the standard channel base band of tire manufacturers, and shall be suitable for pressing on to S. A. E. standard axle tubes for commercial sized wheels built to S. A. E. tolerance for artillery wheels.

2. **RUBBER.** The rubber compound shall contain not less than 65 per cent by volume of best quality new wild or plantation rubber. If reclaimed rubber or mineral rubber is used, it must be in addition to the 65 per cent of new rubber required, and the manufacturer must declare the amount and kind of reclaimed rubber or rubber substitutes used in his compound and it must not be permitted.

3. **SULPHUR.** The total sulphur shall not be more than 8 per cent of the weight of the new rubber used except as follows: if the manufacturer desires to use sulphur-bearing fillers, thereby causing the total sulphur to be over 8 per cent of the weight of new rubber, the finished unvulcanized stock, for and for and a sample of the finished unvulcanized stock. Such stock shall not show a sulphur content in the acetone extract of over 8 per cent of the weight of new rubber used.

4. **ANTIOXIDANT MATTER.** The rubber compound shall be free from sapiniferous oils, or anything made from them.

5. **CHEMICAL TESTS.** Where chemical tests are used, they shall be made in accordance with the Bureau of Standards methods.

6. **TENSILE STRENGTH.** The average tensile strength of rubber compound shall not be less than 1,800 pounds per square inch, with a minimum elongation of 500 per cent, with a minimum tensile strength shall be 2,000 pounds per square inch. Five samples shall be cut from each tire under test; the samples to be cut from the center of the tread, one from the center of the tread, one from the center of the tread, one from the center of the tread, one from the center of the tread. The average shall be taken on not less than five samples. Pieces obviously defective will not be considered in calculating the average result.

7. **STRETCH TEST.** The breaking point of each one-inch test piece above referred to shall stretch to total length of 4 1/2 inches before breaking. The sample shall be stretched at the rate of 20 inches per minute.

8. **PERCENTAGE TEST.** The breaking point of each one-inch test section of rubber referred to shall be not more than 40 per cent of the original length two minutes after the rupture.

9. **AGING.** The test flaps of rubber to be tested; place in an oven for two hours at a temperature of 228 degrees F. After removing from the oven, allow to stand for 24 hours and determine elongation. The reason in elongation shall be the breaking point of the test piece above referred to.

10. **ADHESION.** The adhesion test shall be made as follows: (a) place tire horizontally on platen of tire applying press, the tire being supported at the lower ends by a steel band having the same diameter as the base of the tire to be tested. Place on the upper side of

the tread a band 3/4-inch thick with inside diameter 1 1/4 inches larger than outside diameter of flange of base band. The corners of the band to be rounded with 1/8-inch radius. The various sizes of tires are to be submitted respectively to pressures in accordance with the following table. For the tire to pass successfully, the hard rubber must not break loose from the base.

	In. Size of Tire.	In. Dia. Rim.	Lbs. In. Lin. Max.	Press. On Tire.	In. Size of Tire.	In. Dia. Rim.	Lbs. In. Lin. Max.	Press. On Tire.
32 by 3	3	29	175	8	32 by 3 1/2	29	220	10
36 by 3	3	33	...	9	34 by 3 1/2	31	...	11

34 by 6	6	31	...	23	38 by 6	35	...	30
36 by 6	6	33	...	24	40 by 6	37	...	31
38 by 6	6	35	...	25	42 by 6	39	...	32
40 by 6	6	37	...	27	36 by 8	33	...	29
42 by 6	6	39	...	29	40 by 8	37	...	33
1.110 by 100 mm.	47	325	24	1.000 by 1.25 mm.	43	400	27	...

11. **REBOUND TEST.** The rebound shall be not less than 50 as measured by a Wythe rebound instrument. The instrument shall be adjusted to 70 degrees F. for a period of 24 hours before testing and the instrument shall be mounted rigidly in a vertical position. The tire shall be hung on a 12-inch diameter steel drum.

12. **NUMBER OF TIRES TO BE TESTED.** One tire in each lot of five hundred (the tire to be selected by the inspector) shall be tested, and if the tire subjected to the specifications in any of the specifications that the lot of tires represented by it will be accepted, including the tire on which the tests have been made. If the tire subjected to test fails to fulfil the requirements of the specifications in any of the specifications, the lot of tires represented by it, including the tire, which tests have been made, will be rejected. If, however, the maker of the tires demands a further test, three (3) tires shall be selected from the lot of tires which will be rejected, and if all three are found satisfactory, the lot of tires represented by the tires subjected to test will be accepted and the Government will pay 50 per cent of the cost of the lot on which tests have been made. If any tire fails in the latter tests, the whole lot will be rejected.

13. **ROAD TEST.** Manufacturers bidding on government requirements must meet the following conditions:

(a). A bidder must supply an affidavit before delivering any tires to the Government, stating that the tires to be delivered are of the same cross-section and material of tires which he has previously tested in accordance with paragraphs (a) and (b), and a sufficient number of tires satisfactory to the Government, not less than four, have averaged on the rear wheels, at least 7,000 miles.

(b). The speeds, tire sizes, loads (which may be merchandise), and road conditions must be such that the tires are properly tested. The Government may appoint an inspector to see that the above conditions are complied with.

(c). A bidder must supply an affidavit before delivering any tires to the Government, stating that the tires to be delivered are of the same cross-section and material of tires which he has previously tested in accordance with paragraphs (a) and (b), and a sufficient number of tires satisfactory to the Government, not less than four, have averaged on the rear wheels, at least 7,000 miles.

Tests on tires of 5-inch cross-section size, or larger, will be considered by the Government as tests on tires of 4 1/2-inch cross-section size.

14. **MARKING.** All tires will have molded on the side of the tread rubber, the tire size, i. e., the width and diameter and also the rubber compound or specification number, and a symbol representing the name of the manufacturer, and name of the manufacturer.

The tires shall also have marked, by stamping deeply into the steel tire channel, the tire serial number and a symbol representing the name of the manufacturer. The above data shall be stamped under the overhanging edge of the steel channel. In case of artillery tires they shall be marked according to blueprint submitted.

15. **SECTION OF TIRES.** Full-sized drawings shall be submitted with proposals showing the exact section of the tires which it is proposed to furnish. Sample section of the actual tire in each size shall also be submitted.

16. **WEIGHTS AND AREAS.** The total weight of tire, weight of rubber, weight of steel, together with the weight of the steel, the weight of the rubber in tire, and also the area of tread rubber over the area of the channels must be definitely stated in proposals, and this data will be given free to the Government for its use.

17. **GROOVING OF TIRES.**—Fire iron 1/2 inch wide and larger shall be provided with approved grooving on face of tire.

18. **GRADING.** The manufacturer of each tire must guarantee them to be free from defects in material and workmanship.

19. **BASE BAND.** The tire base shall be made of open hearth steel and rolled to approximate finished dimensions. Chemical analysis shall be as follows: carbon, 0.12 to 0.22-0.17; silicon, 0.03 to 0.05; phosphorus less than 0.04; sulphur less than 0.05.

20. **WELDING.** The welds shall be electrically welded. They shall be truly circular and free from appreciable warp.

DIMENSIONS OF BASE BANDS. The inside circumference of base bands of standard S. A. E. commercial size shall be in accordance with standard practice of tire manufacturers, but manufacturer must guarantee tire shall not come off when applied to standard S. A. E. wheels. Tires made for artillery wheels shall have the inside circumference of base bands made in accordance with dimensions and tolerance given on Ordnance Department drawings.

To determine the effectiveness of the welding process used pieces of base band metal not less than 8 inches in length will be welded together and turned down to a standard specimen and three such pieces containing welds pulled in a testing machine. The total pull required to separate each piece shall be not less than 45,000 pounds per square inch of cross section.

In order to determine whether the base bands are being properly welded in the factory, the finished tires to be tested in the manner described above. The strength of the welds in production shall be not less than 45,000 pounds per square inch of cross section.

20. **PREPARATION FOR SHIPMENT.** (a) **Painting.**—Paint metal bases with rust-resisting paint.

(b) **Wrapping.** No wrapping required.

(c) **Marking.**—Shipping instructions to be shown on printed label pasted

to inside of tire band and with a protective coating of silicate of soda over the fabric.

PNEUMATIC INNER TUBES (GREY).

Specification No. 1062A.

NOVEMBER 1, 1918.

1. **GENERAL.** This specification covers the following sizes:

1. 28 by 3 1/2	31 by 4	36 by 6
29 by 3 1/2	33 by 4	36 by 6
30 by 3 1/2	35 by 5	40 by 8

(b) All tubes manufactured to this specification shall be of the endless type, except motorcycle tubes which shall be butt end or endless as ordered. (c) All tubes shall be free from defects and guaranteed as to material and workmanship.

2. **COMPOUND.** (a) Tubes shall be made from and have the characteristics of a compound containing a minimum of 93 per cent by volume of the best quality new wild rubber. Sulphur content shall not exceed 7 per cent by weight of new rubber used.

(b) The creosote extract of the cured compound shall not exceed 5% per cent by weight of new rubber used.

(c) Compound shall be free from ingredients known to the trade as oil substitutes and/or reclaimed rubber.

3. **CUTTING.** (a) Tubes shall fill the specification in the following table for minimum cutting pole size, minimum gages and minimum length.

Size	Minimum Pole Size.	Minimum Thickness.	Minimum Finished Length.
28 by 3 1/2	1 7/8 inches	0.072-inch	77 inches
29 by 3 1/2	2 1/8 inches	0.090-inch	78 inches
30 by 3 1/2	2 3/8 inches	0.108-inch	81 inches
31 by 4	2 1/2 inches	0.095-inch	82 inches
33 by 4	2 3/8 inches	0.110-inch	89 inches
35 by 5	3 inches	0.125-inch	92 inches
36 by 6	3 1/2 inches	0.180-inch	92 inches
38 by 7	4 1/4 inches	0.210-inch	94 inches
40 by 8	5 inches	0.250-inch	96 inches

(b) In case tube is mold-cured, measurements must be equivalent to above as determined by volume. If larger-sized poles are used volume of rubber shall be at least equal to above measurements.

4. **SPlice.** The splice shall be as strong as the rest of the tube under the inflation test.

5. **VALVES.** Each tube shall be fitted with one complete Schrader valve, or its approved equal, applied in such a manner as not to leak or tear out under ordinary usage. The following schedule shall apply:

28 by 3	Schrader's	No. 1936
29 by 3 1/2	Schrader's	No. 1936
30 by 3 1/2	Schrader's	No. 725
31 by 4	Schrader's	No. 725
33 by 4	Schrader's	No. 725
35 by 5	Schrader's	No. 792
36 by 6	Schrader's	No. 2033
38 by 7	Schrader's	No. 2033
40 by 8	Schrader's	No. 2033

Each valve shall be fitted with lock nut, rim nut and valve cap. Dust cap shall be furnished for all valves with the exception of 28 by 3, 29 by 3 1/2, by 6 and over. Sprayers shall be furnished for all sizes up to and including 35 by 5.

6. **MARKING.** Tubes shall be plainly marked with the manufacturer's name and size of tube, in both inch and the metric equivalent in accordance with S. A. E. standards.

7. **TESTS AND INSPECTION.** (a) Chemical and physical tests shall be made from each lot of one thousand tubes or less in order to secure deliveries of uniform quality, and in accordance with the requirements of these specifications. These tests and analyses shall be made in accordance with the procedure followed by the Bureau of Standards, Washington, D. C. The average results of four test pieces cut longitudinally from the tube shall show an ultimate elongation of not less than 750 per cent (1 to 8 1/2 inches) when stretched at the rate of 20 inches per minute. The thickness ends being gradually enlarged to a width of approximately one inch to provide a satisfactory gripping surface. The permanent set determined by the average of four tests with pieces as above, shall not exceed 10 per cent followed by a rest of 10 minutes. All tests shall be made at a temperature between 65 and 90 degrees F.

(b) Each tube shall be tested for leaks by inflating with air and immersing in water.

(c) The Government reserves the right to make any inspection, test or analysis necessary to insure the product meeting all requirements of the specifications.

8. **PACKING.** Packing shall be as per specifications accompanying request for bid.

AUTOMOBILE TIRE ACCESSORIES.

Specification No. 1073A.

NOVEMBER 1, 1918.

1. **BLOW-OUT PATCHES.** These are recommended only for emergency repairs. A vulcanized repair should be made as soon as possible.

Patches must be made of at least six plies of seven-ounce fabric or its equivalent weight of fabric, and feathered by the Government. The plies must be properly stepped down, according to good commercial practice. Two ears are required on all patches. The length of the patch must be according to the manufacturer's standard commercial practice. The 3 and 3 1/2-inch must be designed for use with clincher fabric tires and the 4, 4 1/2, and 5-inch must be of ample size for use with cord tires.

2. **CEMENT PATCHES.** These shall be one standard size 1 1/2 inches in diameter. The gage and compound of the stock must comply with the specification for cured-back tube stock as given in the repair material specification. Patches must be molded and finished as preferred.

3. **RELINERS.** These are recommended only in case of extreme necessity. All sizes up to 4 inches must be made of at least three plies, while 4 and larger must be made of at least four of seven-ounce fabric, or its equivalent, as approved by the Government. The 1 1/2 must be built up on the bias and a lap of at least 6 inches is required. The edges

must be properly stepped off on the sides and skived on the ends to insure against injury to the tube. Each of the reliners must be designed so that its width will allow it to properly fit the standard tire size. This includes 3 and 3 1/2-inch in fabric clincher and 4-inch or larger in cord tires. The edge must be approximately 3/4-inch above the toe of the bead.

4. **FLAP.** Motorcycle flaps must be of the cemented type and equal in construction and quality to the flap supplied by the bidder on tires made to government specifications.

5. **Fabric Core Patches.** These patches must be made according to the manufacturer's standard practice from carded Egyptian, combed peeler cotton fabric, or their physical equivalent, as approved by the Government, weighing not less than 13 ounces nor more than 16 ounces per square yard.

The plies must be laid on the bias, fictioned or spread and skim-coated on both sides equally to a minimum gage of 0.043-inch. The compound must fill the specifications set forth in the repair material specifications covering friction, skim, cushion and tube stocks.

All sizes up to six-inch must be four plies and six-inch and above shall be six plies. Core patch must be properly stepped down and preference will be given to gum stripped ends to insure against injury to the tube. There shall be applied in the center of the back of the patch a padding of not less than 1/16-inch thick. The minimum length and breadth of the padding shall not be less than the length of pad specified below.

The following sizes are standard and lengths required are given in table:

3 1/2 and 4-inch patch—length 10 inches. Length of pad 4 inches.
4 1/2 and 5-inch patch—length 11 inches. Length of pad 5 inches.
6-inch patch—length 12 inches. Length of pad 6 inches.
7-inch patch—length 13 inches. Length of pad 7 inches.
8-inch patch—length 14 inches. Length of pad 8 inches.

6. **VALVE ACCESSORIES.** (a) Valves:

Schrader's 1936 or approved equivalent for motorcycle tubes. Schrader's 725 or approved equivalent for 3 1/2 and 4-inch auto tubes.

Schrader's 792 or approved equivalent for 4 1/2 and 5-inch auto tubes.

Schrader's 2033 or approved equivalent for 6-inch tubes and larger.

(b) Valve caps: Schrader's 880 or approved equivalent.

(c) Valve insides: Schrader's 1801 or approved equivalent.

(d) Tire gage: Schrader's straight Universal gage or approved equivalent for small cars and motorcycles.

Schrader's right-angle gage or approved equivalent for large cars and pneumatic-tired trucks.

(e) Pump connection: Schrader's Universal No. 2238 or approved equivalent.

(f) Deflating caps: Schrader's No. 1886 or approved equivalent.

(g) Valve repair kit: Schrader's No. 2395 or approved equivalent.

(h) Repair kit: Schrader's No. 2033 or approved equivalent.

7. **REPAIR KITS.** Repair kits shall be made up with the following material—packed in a round cardboard carton with tin ends and cover, approximately 2 1/2 inches in diameter and 2 1/2 inches deep.

It shall contain:—

6 standard cementless patches. Refer to Specification No. 1073A-2.

Strip of curd-back tube gage 2 by 8 inches and 2 by 7 inches.

Tube of cement 2 1/2 by 1/2 inches in diameter or equivalent.

Piece of sandpaper 2 by 8 inches or equivalent.

2 valve insides. Schrader's 1801 or approved equivalent.

1 valve cap. Schrader's 880 or approved equivalent.

Carton to be labeled as follows:

For Temporary Tube Repairs.

For repairing small punctures use "Cementless Patches." Roughen the tube with sandpaper, then apply cement and allow to dry. Remove cloth from patch and apply. Tube can be used at once.

For repairing blow-outs use combination repair stock. Roughen tube around cut with sandpaper, then apply coat of cement around cut inside and outside of tube. Allow to dry. Cut piece combination stock 3/4-inch larger in all dimensions than cut and place inside of tube, fitting edges of cut together over center of stock. Apply another coat of cement outside of tube and allow to dry. Cut and place combination stock size of puncture stock outside of tube over center of blow-out. Tube can be used immediately.

NOTE: Always remove cloth from patch and combination stock before applying and place cloth side next to tube.

REPAIR MATERIAL FOR PNEUMATIC TIRES.

Specification No. 1067A.

NOVEMBER 1, 1918.

1. **FABRIC.** (a) **CORD TYPE NECESSARY.** (a) Square-woven Building Fabric. This fabric shall be 17 1/2 ounces per square yard with an allowable variation of 3 per cent plus or minus. It shall be 23 by 23 weave. The fabric shall be made from long-staple cotton with a tensile strength of not less than 150 pounds per inch. Methods of testing to be the same as specified in the fabric casing specifications. The fabric shall be frictioned both sides and skim-coated one side to a minimum gage of 0.043-inch.

(b) **Cord Builder Fabric.** This fabric shall be made from long-staple carded Egyptian or combed peeler cotton, or their physical equivalent as approved by the Government, weighing not less than 13 nor more than 16 ounces per square yard. The cord fabric shall be frictioned or spread both sides and skim-coated equally on both sides to a gage of 0.050-inch. The square-woven building fabric shall be frictioned on both sides at least 8 ounces per square yard. It shall be made from long-staple cotton and shall be frictioned both sides.

(c) **Breaker Fabric.** This breaker shall be an open-weave fabric of at least 10 ounces per square yard. It shall be made from long-staple cotton. It shall be frictioned or spread and also skim-coated equally on both sides. The minimum gage shall be 0.070-inch.

(d) **Compound Only.** These specifications: (a) Friction, skim, cushion and tube repair stock. Specific gravity not to be over 1.30. These

shall be made from and have the characteristics of a compound containing at least 65 per cent by volume of new wild or plantation rubber. Compound shall contain no reclaimed rubber. The compound shall be free of impurities known to the rubber trade as oil substitutes.

(b) Two tread stocks shall be used. There shall be a black stock of specific gravity not over 1.60 and a white or grey stock of specific gravity not over 1.90. The tread shall be made from and have the characteristics of a compound containing at least 50 per cent by volume of the best quality new wild or plantation rubber. The kind and quality of the reclaimed rubber must be declared when used. The compound shall be free of impurities known to the rubber trade as oil substitutes. The tensile strength of a properly cured "tread" sample shall be 2,000 ounces per square inch with a minimum elongation of 400 per cent (2 to 10 inches) as determined by the average of four test pieces when stretched at the rate of 20 inches per minute. The test pieces shall be cut $\frac{1}{8}$ -inch wide over a gage length of two inches, the ends being gradually enlarged to a width of approximately one inch. The permanent set shall be determined by the average of four tests with test pieces as above, shall not exceed 30 per cent after an elongation of 350 per cent (2 to 9 inches) for ten minutes, followed by a rest of ten minutes. All tests shall be made at a temperature between 65 and 90 degrees F.

(c) Sidewall Stocks.—Use tread stock.
(d) Retread Secured Bands.—1" c. repair tread stock specifications.
(e) Cured-back Tube Stock.—The uncured stocks used must fill the specifications for the friction coat and cushion stocks. The gage of the raw gum shall be not less than 0.015. The gage of the cured gum shall be not less than 0.025.

3. CEMENTS—TWO CEMENTS ONLY. (a) Vulcanizing Cement. This cement shall be made from a compound having a maximum specific gravity of 1.15 containing at least 75 per cent by volume of the best quality new wild or plantation rubber and shall be free from ingredients known to the rubber trade as oil substitutes and/or reclaimed rubber. It shall be dissolved in benzol. The rubber compound content by weight to be determined by evaporation and milled to constant weight, shall be not less than 17 per cent of the total weight of the cement.

(b) Acid Cure Cement. This cement to be made from the best quality new wild or plantation rubber with no other ingredients with a benzol solvent. The pure rubber content weight to be determined by evaporation and milled to a consistent weight, shall be not less than 8 per cent of the total weight of the cement. The acid solution used with this cement shall be 2 per cent monochloride of sulphur and 98 per cent benzol.

4. CURE. The base cure on a 4-inch section for repair material must be based on 45 minutes at 50 pounds steam pressure, it being understood that cure is to be made under proper conditions.

5. PRICES. Repair materials will be purchased on a pound basis. For comparison of different quotations the specific gravity and price on the basis of volume must be submitted by the bidder in addition to the price on a weight basis, it being understood that the volume price shall be the price per square yard of the gage specified in the request for bid.

6. VALVE BASKS. Two sizes designated as large and small will be required. The standard commercial, after sample bases have been submitted to and approved by the Government, will be accepted.

7. AIR BAGS. The air bags shall be made according to the standard practice and design of the manufacturer. A sample section of the bag showing the reinforcement and construction of the bag must be submitted to the Government for approval. Bags must be tested with 100 pounds air pressure and show no leaks when immersed in water.

THE FIRST SCREW-FORCING MACHINE.

THE well-known screw-forcing or tubing machine has long been the standard one for forming plastic materials into rods, tubes and an endless variety of other forms in continuous lengths, and may be found in nearly every rubber factory.

The Editor of "The India-Rubber Journal" wrote interestingly (July 7, 1917, page 13) of the introduction of the forcing machine to the rubber industry of Great Britain, remarking as follows:

"The first forcing machines made their appearance in the late 'seventies or early 'eighties, and were, we think, the production of a Scotch firm, who had not previously been known as makers of rubber machinery. Some say it was an American invention, but though there are some early American patents referring to it, we do not think it was first made in America.

In another issue of the same journal (July 28, 1918, page 8), Mr. R. T. Cooke, for Francis Shaw & Company, Limited, communicated the interesting fact that the first British-made forcing machine was designed and made by the late Francis Shaw in 1878-1879, while in the employ of Messrs. Chas. Macintosh & Company. The editor of the "Journal" however, questions these claims of priority, adding:

"On the other hand we have evidence, upon which we based our statement, that the invention was claimed in an altogether different quarter. This point, although small, is interesting, and we shall be glad if any old-time mill managers, or machine makers will give us their views upon it.

In this connection the following remarks, taken from a letter dated October 30, 1917, written to THE INDIA RUBBER WORLD by the late William Kiel, indicate that he designed and introduced the tubing machine for rubber working:

"I am pleased to furnish the information that when I was first engaged in the establishment of the Rubber Comb & Jewelry

Co.'s factory¹ in 1876, I had a rod and tubing machine constructed according to my own idea, which machine and duplicates thereof have been in use ever since. Indeed there were many improvements made by machine builders since that date, though the principle of the machine has never changed very materially, but if the Macintosh people had no machine up to 1876, the Rubber Comb & Jewelry Company antedated them by two years.

THE ORIGINAL KIEL TUBING MACHINE.

We are indebted to Mr. W. Weiting, vice-president of the American Hard Rubber Company, for the accompanying illustration of the machine referred to by Mr. Kiel and the information that it is still in use.

¹ Located in West Burlington, now Butler, New Jersey. This company was combined with others to form the present American Hard Rubber Co. of which for many years William Kiel was the general superintendent.

UNITED STATES RUBBER CO.'S SCHOOL FOR FOOTWEAR FACTORY EXECUTIVES.

Last spring the United States Rubber Co. inaugurated a school in which to train men selected from its several foot-wear factories for executive positions, this training to comprise, in the main, time study and job analysis. Necessary to success in this field was the use of the slide rule and the intelligent reading of books on the principles of scientific management, and industrial organization.

This class started in New Haven and was shortly moved to Williamsport, Pennsylvania, taking its quarters in the planning department of the Lyscoming Rubber Co. In all, about twenty-five students have been sent to the school. Of this number the following will complete the course by Christmas and be returned to their respective factories: G. C. Bauer, Shoe Hardware Co., Waterbury, Connecticut; J. F. Curran, Naugatuck Glove Co., Naugatuck, Connecticut; G. L. Drown, National India Rubber Co., Bristol, Rhode Island; E. J. Artesani, National India Rubber Co., Bristol, Rhode Island; R. J. Ford, Woonsocket Rubber Co., Woonsocket, Rhode Island; H. E. Chittingworth, Candee Rubber Co., New Haven, Connecticut; F. P. Goodwin, American Rubber Co., Cambridge, Massachusetts; C. J. Lahr, Wool Boot Rubber Co., Hastings, Michigan; N. A. E. Nelson, Goodyear Metallic Rubber Shoe Co., Naugatuck, Connecticut; W. C. Robinson, Candee Rubber Co., New Haven, Connecticut; H. A. Curtis, Lyscoming Rubber Co., Williamsport, Pennsylvania; R. W. McGreggor, United States Rubber Co., New York City.

Beginning January 1 the school will be moved to New Haven, Connecticut, to occupy new quarters now being prepared in offices of the Candee Rubber Co.

Vulcanization Control.

THE interest of every practical rubber worker centers in the process of vulcanization because it is the basic operation on which the value of his output depends. Vulcanization, or the chemical union of sulphur and rubber as made known by Goodyear, Hancock and Parkes in the last century, came under scientific control only within recent years.

The work of the heater-man in charge of the operation of the vulcanizer formerly constituted a very imperfect means of control. The human operator cannot be relied upon, no matter how skilled and conscientious, just because he is human. He forgets, becomes fatigued, has his attention distracted and makes mistakes. It is unnecessary to emphasize the importance of exact control of any manufacturing process, because it is, in fact, axiomatic. Without control uniformity of product is impossible.

IMPORTANCE OF UNIFORM TEMPERATURE AND DRY STEAM.

Mention may be made of certain points which emphasize the value of vulcanization control in eliminating defective product. The effect of too long continuation of the heat of vulcanization is "overcured" or "burned" product resulting in such defects as excess hardness, lack of elasticity and rapid deterioration with age. Too short continuation of the cure leaves the goods "uncured," soft, tacky, or porous, and practically without elastic effect.

Curing in wet steam is undesirable because it results in uneven distribution of heat in the goods, hence irregularity of cure and tendency to undercure. Dry steam circulation in the heater and constant elimination of condensation are essential to uniform heat distribution, either in a boiler or press cure vulcanization.

THE NECESSITY OF GRADUAL INCREASE IN TEMPERATURE.

It is always desirable in vulcanizing rubber goods in large masses, as, for example, thousands of feet of hose on poles or solid tires in molds, to raise the heat gradually over a given period to allow for heating the hose poles or molds to the point where they will not cause loss of heat by condensation, and thus allow the rubber to attain the vulcanizing temperature of the steam. Sometimes this result is obtained by raising the temperature of the heater gradually and sometimes by raising it in a series of steps. The object is to ensure the application of the vulcanization temperature to the goods for a prescribed length of time.

Having determined a suitable plan of conducting the heat progressively, these conditions may be positively reproduced at will by mechanical means. By hand-regulation the rise of heat from stage to stage lacks uniformity and the vulcanizing temperature never remains constant, but fluctuates seriously.

These irregularities have a marked influence on the perfection and uniformity of cure and frequently are the cause of perplexing freak conditions very baffling to eliminate.

AUTOMATIC CONTROL OF VULCANIZATION.

The introduction of automatic control of time, temperature and exhaust has made possible perfect vulcanization, a condition vitally essential to a guaranteed product. The development of automatic control of vulcanization has been perfected and extensively adopted in American practice. The system necessitates special instruments and system of piping, but is not subject to disarrangement and is positive and reliable in operation.

STEAM CONTROL.

The principle on which steam control is regulated is the transmission and multiplication of the motion of a capsular spring which expands and contracts with changes in temperature and

consequent change in steam pressure. A ball valve is thus operated, which allows more or less air pressure to open or close a diaphragm-motor steam valve to a greater or less extent. Compressed air affords an instant, flexible and effective means for doing any amount of work required, especially when the steam temperature shows only a slight tendency to change, and when, therefore, the capsular spring moves only an infinitesimal extent.

For the operation of a tire-vulcanizing press a compound controller is frequently used. One of these controllers maintains a uniform steam temperature within the press, while the other takes care of the exhaust at the bottom of the press by periodically relieving the heater of the water of condensation and the super-saturated steam. An automatic time control instrument is set to regulate progressive increase of temperature and the duration of the cure, at which point it promptly shuts off the steam supply and opens the exhaust. It can also be arranged to turn on cold water for flooding and cooling the contents of the vulcanizer.

CHARTING THE CURE.

In the system of vulcanization control is usually included a recording thermometer which produces on a chart a graphic record of just what the controllers have accomplished in maintaining uniform temperature and time and serves as a permanent record. Examination of the charted records shows the perfect exactness with which it is possible to control the time and heat of the vulcanizing operation.

OPPORTUNITIES FOR SOUTH AMERICAN TRADE.

John B. Maus, export manager of The Fisk Rubber Co., Chicopee Falls, Massachusetts, whose portrait appeared in our issue of September 1, 1918, has just returned from a 15,000-mile trip through South America. On the evening of December 17, 1918, he addressed the Chamber of Commerce, Springfield, Massachusetts, on the various aspects of trade in the future with South America. About 100 were present at the meeting.

Mr. Maus emphasized the following needs for successful commercial relations with our sister republics: concentration on the South American market; learning to know the South American people; adequate knowledge of the Spanish language; comprehensive knowledge of geography and familiarity with the financial and business relations of the world; the sending of trained men to South America to study credits and competition; the arrangement by our banks to extend loans to South Americans and establish branches in their country.

Incidentally, Mr. Maus cited the fact that in 1913 British ships cleared the Argentine with 1,843,328 tons of merchandise, while ships flying the American flag cleared only 27,190 tons. He advocated a great merchant marine composed of fast vessels manned by crews under merchantmen's pay, to be picked from our Navy.

THE RUBBER MARKET AT SINGAPORE.

There seems to be considerable doubt as to the effect on the price of rubber by the present weekly Singapore auction sales, which last two days. On the other four days there are private sales between parties meeting in each other's offices. There seems to be a general feeling in favor of the establishment of a rubber exchange, in which sellers could exhibit their samples, and where buyers and sellers could meet for about two hours every morning. The exchange would, at first, only supplement the weekly auctions.

The Vulcanization of Rubber at Constant Temperature and by a Series of Increasing Temperatures.¹

By G. D. Kratz and Arthur H. Flower.

SLIGHTLY CONDENSED, this paper is given as prepared by the authors.

When vulcanization of rubber is effected by heating for a period of time at a definite and constant temperature, the rate of combination of the sulphur with the rubber decreases with the time. In this particular instance we have endeavored to maintain a constant rate of combination of the sulphur and rubber by a variation in the temperature. Our efforts have been confined primarily to devising a method for calculating a series of temperatures by the use of which the rate of vulcanization might be accurately controlled and to make a comparison of the physical characteristics of a rubber mixture vulcanized to the same point by both methods.

The vulcanization of rubber at constant temperature was regarded by Weber² as consisting in a chemical reaction between the rubber and sulphur. Later, Skellon³ also recorded results which tend to show that the combination of sulphur with rubber is strictly a chemical reaction, which is first preceded by the melting of sulphur and its solution in the rubber. Likewise he maintains that the rate of combination for unit time and constant temperature decreases with the decrease in the active mass of the sulphur present. Ostwald,⁴ on the contrary, has regarded the vulcanization phenomena as due to an adsorption of the sulphur by the rubber, the rate of which, when expressed graphically, follows the typical adsorption isotherm. Spence⁵ and his co-workers, however, have demonstrated that Weber's vulcanization curves, on which Ostwald based his calculations, are subject to correction. They⁶ have also shown almost conclusively that the vulcanization phenomenon is the resultant both of an adsorption and a chemical interaction of the sulphur with the rubber, so that the views of others are probably not entirely free from need of modification.

From the results obtained by Spence it is quite obvious that when vulcanization is effected at constant temperature, the major portion of the sulphur combined with the rubber during the early stages of the reaction. Lowering of the initial temperature and subsequently increasing it at regular intervals tends to make the reaction proceed more uniformly.

In fact, for many years it has been common technical practice to employ this method, popularly known as a "rising cure," based mainly upon the fact that it affords a means whereby the low heat conductivity of the rubber may be minimized rather than for the above reason. It is well established that in the case of bulky articles, unless the vulcanizing temperature is exceedingly low, or unless it is initially low and gradually increased as the reaction proceeds, the outside surface may be over-vulcanized before the heat has thoroughly penetrated to the interior of the mass.

There is a distinct and readily measurable relationship between the time required for vulcanization and the temperature at which it is effected, although there is hardly sufficient evidence to warrant its expression as a law. Based on our previous observations we have been able to calculate with accuracy the relative rates of vulcanization for various temperatures and to

apply these different temperatures so that the vulcanization-time curve did actually take the form of a straight line. The satisfactory results obtained were remarkable in that the degree of vulcanization was measured not by chemical but by physical means, which is shown later to be a dangerous procedure.⁷

In the application of the above, however, although the accuracy of our calculations and the control obtained over the rate of combination of the sulphur with the rubber exceeded our expectations, the differences noted in the physical characteristics of a mixture vulcanized by the two methods were not widely different until a sulphur coefficient of 3.9 was obtained. At this point, vulcanization at constant temperature resulted in a product which was noticeably inferior to the same mixture when vulcanized by a series of increasing temperatures.

This was not entirely unexpected, as, in the case of a mixture containing 5 per cent of sulphur, vulcanized to the point of "technical cure" with a sulphur coefficient of 1.69, the vulcanization-time curve at constant temperature so closely approximated a straight line that, for all practical purposes, a unit amount of sulphur may be said to have combined in unit time by either method. In fact, the same statement may be made with reservation even up to a vulcanization coefficient of 2.9, although at this point both the tensile strength and elongation, particularly the latter, of the mixture vulcanized at constant temperature were found to be slightly inferior to those obtained when vulcanization was effected by a series of increasing temperatures.

Thus, our results would tend to show that the values for the sulphur coefficient, as previously given by others, are in all cases high. Even the figures 2.8 to 3.0, recommended by Spence, appear to be excessive, while the values established by Eaton and Day are entirely out of question. Furthermore, it seems evident, that, as has previously been stated by De Vries, changes in the rubber-sulphur mixture which determine the physical properties of the mixture, proceed independently of those which determine the vulcanization coefficient. Or in other words, the past history of the sample must be known if it is to be judged solely on the basis of its sulphur content.

Likewise, whatever figure may be decided upon as the correct vulcanization coefficient for *Hevea* rubber, it is essential in order to obtain maximum physical results by vulcanization at constant temperature, that restrictions be placed upon the minimum amount of sulphur and catalyst allowable in the original mixture. For best results at constant temperature there should be present in the mixture such quantities of both sulphur and catalyst that the active mass of the sulphur is not decreased to an extent that will slow up the rate of reaction before the desired sulphur content is attained. If this is not taken into consideration the continued heating necessary to effect the com-

¹This work is now being repeated, the rate of vulcanization being measured by both chemical and physical means.

²The term "technical cure" is used to indicate that degree of vulcanization at which are found coincident maximum tensile strength and maximum elongation. This is not necessarily dependent upon the vulcanization coefficient, although a certain relationship does appear to exist between them. "Technical cure" is thus used in contradistinction to "optimum cure," as it has been our experience that what is generally known as "optimum cure" is, in most instances, for practical purposes an over-cure and that the previously established values for the correct vulcanization coefficient are for the most part high. Certainly it should not be in excess of 2.8 per cent, for *Hevea* rubber. In connection with other work we have also determined the vulcanization coefficient of certain rubbers other than *Hevea*. These results show that although the coefficients for these rubbers are not necessarily constant, as suggested by Spence and Eaton, they should not be in excess of the following figures: *Plantation Hevea*, 2.8; *Fine Hard Para*, 3.2; *Red Katsai*, 3.4; and *Cera* (Manihot), 4.4. Samples of these rubbers with high coefficients were found to age quickly with rapid deterioration.

bination of the latter fractions of the sulphur undoubtedly impairs the quality of the final product.

Under certain conditions we have found it possible to obtain a uniform rate of vulcanization for a rubber-sulphur mixture by employing a previously calculated series of increasing temperatures such that the vulcanization-time curve is reduced to a straight line.

By so doing we have shown that at comparatively high sulphur coefficients a better product is obtained by vulcanization with a series of increasing temperatures than with a constant temperature. We have also found the vulcanization coefficients previously recommended by others to be excessive, and that, unless the history of the vulcanization phenomenon is fully known, it is unsafe to judge samples solely on the basis of their sulphur content.

The mixture used by the authors in their experiments consisted of the following proportions by weight:

First latex plantation crepe	100
Zinc oxide	100
Sulphur	5
Basic amine	0.33

The rubber used was the best quality typical of its variety and was subjected to the minimum amount of milling necessary to work in all of the ingredients. The basic amine (catalyst) was ground to 200-mesh and was worked into the rubber before the pigment and sulphur were added.

An investigation was made of the rate of vulcanization of this mixture at a constant temperature of 298 degrees F. Our results, which confirm those previously obtained by others, are tabulated in Table I and are expressed graphically in Figure 1. By this table and figure it is also shown that although 60 per cent of the sulphur present in the mixture combined with the rubber during the first two hours, less than 80 per cent had entered into combination at the end of 4 hours.

TABLE I. VULCANIZATION AT A CONSTANT TEMPERATURE OF 298 DEGREES F.

Vulcanization Time, Min.	Combined Sulphur, Per cent.	Tensile Strength, Lbs. per Sq. In.	Elongation, Per cent.	Permanent Set, Per cent.
10	0.404
15	0.578
20	0.663
25	0.840
30	1.087	1527	222	11.12
40	1.330	1533	710	14.06
50	1.490	1930	707	15.23
60	1.690	2277	697	15.62
70	1.875	2015	685	17.97
80	2.170	2102	690	20.30
90	2.485	2055	680	21.09
120	3.410	2060	678	24.22
150	3.600	1725	677	25.78
180	3.780	1435	680	23.44
240	3.920	1475	652	18.75

It is seen in Table I that the "technical cure" for this mixture is obtained in about 60 minutes at 298 degrees F. with a vulcanization coefficient of 1.69. Further, while the general

FIGURE 1.—VULCANIZATION-TIME CURVE AT CONSTANT TEMPERATURES.

shape of the curve in Figure 1 was found to be convex to the x-axis, that portion up to and including this 60-minute point very closely approximates the straight line OA drawn through this point. Thus in the case of this particular mixture "technical

vulcanization" is attained before the active mass of the sulphur present is decreased to an extent which would produce a marked decrease in the rate of vulcanization.

It has been shown above that at a coefficient of 1.69 our method was not applicable for the differentiation of the small

variations in the quality of the mixture, due to the method of vulcanization employed. For this reason a comparison was made of the physical characteristics of the mixture when vulcanized to a coefficient of 3.9 at constant temperature and by a series of increasing temperatures.

The temperatures and times to be employed to effect vulcanization by the latter method may be readily obtained by applying the data given in Table I and Figures 1 and 1a. First, the number of different temperatures to be used should be previously decided upon. Second, the number of minutes required to effect a "technical cure" at each of these temperatures may be obtained from Figure 1a. Then, treating each temperature in the series individually, let

t = time in minutes required to effect a "technical cure" at that temperature. (From Figure 1a.)

t' = time in minutes required to effect a "technical cure" at 298 degrees F. (From Table I.)

c = time in minutes required to attain the desired vulcanization coefficient at 298 degrees F. (From Table I.)

n = number of temperatures in the series.

Then,
$$t \times \frac{c}{t'} = T$$
 where T equals the number of minutes required for vulcanization at a given temperature when employed in the previously established series.

It is quite obvious that, if temperatures are chosen at random from the figure, the sum of the times for the complete series of temperatures may not be the same as the time required to effect the desired degree of vulcanization at a constant temperature of 298 degrees F. On the other hand, it is easily possible to make a selection such that the total time of vulcanization is the same by either method. In order that our results might be strictly comparable, we chose the following series of four temperatures, the sum of the times of which was exactly equal to 240 minutes, the time required to obtain a coefficient of 3.9 at 298 degrees F.

285.5 degrees F. for.....	107 minutes
298.0 degrees F. for.....	60 minutes
302.5 degrees F. for.....	43 minutes
307.0 degrees F. for.....	30 minutes
Total	240 minutes

Employing the foregoing series of temperatures and times, the mixture was vulcanized in a button mold for a total time of 240 minutes, samples being removed for combined sulphur estimation at hourly intervals and at each change in the vulcanizing temperature. These results are shown in the first four columns of Table II and expressed graphically by the solid line in Figure 2. It is readily observed that the results obtained coincide al-

FIGURE 1a.—TEMPERATURE-TIME CURVE FOR VULCANIZATION TO TECHNICAL CURE.

most exactly with the hypothetical straight vulcanization-time curve represented by the dotted line O B in Figures 1 and 2.

Separate slab cures were then made for physical tests, at the temperatures and times required to produce vulcanization co-

FIGURE 2.—VULCANIZATION-TIME CURVE FOR INCREASING TEMPERATURES.

efficients of 1.56, 2.96, and 3.86. The results of these tests are shown in the last three columns of Table II.

TABLE II.—VULCANIZATION BY A SERIES OF INCREASING TEMPERATURES.

Total Time at the Vulcanization, Min.	Difference, Min.	Temperature, Deg. F.	Combined Sulphur, Per cent.	Tensile Strength, Lbs. per Sq. In.	Elongation, Per cent.	Permanent Set, Per cent.
60	60	285.5	0.937	2168	715	17.97
107	107	285.5	1.567
107	107	285.5	1.879
120	13	298.0	2.792
107	107	285.5
167	60	298.0
107	107	285.5
180	60	298.0	2.963	2,334	714	25.52
107	13	302.5
107	107	285.5
210	60	298.0	3.252
43	43	302.5
240	107	285.5	3.862	1944	705	25.00
60	60	298.0
43	43	302.5
30	30	307.0

To facilitate comparison, the results of these physical tests, together with those obtained at the same sulphur coefficient when vulcanization was effected at a constant temperature of 298 degrees F., have been grouped together in Table III. From this table it is seen that there is very little difference in the tensile strength of the mixture at coefficients of 1.69 or 2.94 when vulcanized by either method. But in both instances, a series of increasing temperatures appears to produce a product of superior elongation. When the coefficient is increased to 3.9, however, it is seen that the product obtained by employing a series of increasing temperatures is markedly superior to that obtained at constant temperature, both as to tensile strength and percentage of elongation.

TABLE III.

Combined Sulphur, Constant Temp.		Increasing Temp.		Tensile Strength, Lbs. per Sq. In.		Elongation, Per cent.	
Constant	Increasing	Constant	Increasing	Constant	Increasing	Constant	Increasing
1.699	1.567	2277	2168	697	715	678	714
2.945	2.963	2156	2234	678	714	652	705
3.920	3.860	1435	1944	652	705

It is recognized that the results which have been recorded herein are not subject to indiscriminate or general application.

This work has been confined to the investigation of one rubber-sulphur mixture only, and our calculations have been based on the correct or "technical cure" of the mixture as being obtained after vulcanization for 60 minutes at 298 degrees F. However, as the comparisons made are relative, and as the principle involved will apply to other mixtures and other vulcanization coefficients, we are warranted in drawing the following conclusions:

1.—That it is possible to calculate and apply a series of increasing temperatures such that the vulcanization-time curve for any rubber-sulphur mixture may be made a straight line, the slope of which is dependent on the temperatures employed and the amount of catalyst present.

2.—That in vulcanization at a constant temperature, in order to procure maximum physical properties, sulphur must be present in the mixture in such an amount that its active mass is not decreased to an extent which will appreciably slow up the rate of reaction before the desired vulcanization coefficient is attained.

3.—That for rubber-sulphur mixtures containing 5 per cent or less of total sulphur, the physical properties of the mixture, when vulcanized by a series of increasing temperatures, are superior to those obtained by vulcanization at constant temperature; this is particularly true at vulcanization coefficients of 2.8 or above.

4.—That the vulcanization coefficient for *Hevea* rubber is probably between 1.7 and 2.8.

5.—That it is dangerous to evaluate samples of vulcanized rubber solely on the basis of their vulcanization coefficients.

AIR BRAKES FOR MOTOR TRUCKS AND TRAILERS.

The use of motor-truck trailers has been limited to light loads and fairly level roads, due to the impossibility of controlling heavily loaded trailers with ordinary brakes. With the application of specially designed air-brake equipment this difficulty disappears and the motor truck and trailer become successful factors in the transportation of interurban freight. This opens a new field of business for the manufacturers of air-brake hose and one that presents an assured future.

A two-ton truck and a five-ton trailer with a seven-ton load afforded an exceptional test in a recent trial run where 250

TRUCK AND TRAILER EQUIPPED WITH AIR-BRAKES.

miles of mountains were encountered with grades as stiff as 19 per cent, and four miles long. The fact that the train was held under control under all conditions without damaging the brake linings, speaks well for the brake equipment. For exceptionally severe service, as in construction work, the use of armored hose is contemplated.

With this equipment the use of pneumatic tires is more appealing to the truck owner, as there is always a reliable means of inflation at hand, and as the pneumatic tire gains prestige in the trucking field, air brakes should be the standard equipment on all trucks, whether a trailer is to be used or not. (The Parker Appliance Co., 2619 Vermont avenue, N. W., Cleveland, Ohio.)

NO RUBBER STANDARD AT SINGAPORE.

In Singapore there is no official rubber standard, and each person uses the description that he considers most apt. The Singapore unofficial standard of sheet, called "prime," is higher than the London official standard of sheet, called "f. a. q.," and rubber that would be thrown out in Singapore as not coming up to the level of "prime sheet," might often pass the London "f. a. q." standard. On the other hand, rubber with the marks of a well-known "crack" rubber estate might fetch a premium of a half-penny or so in London over the price for standard quality. That rubber would be "prime" in Singapore.

What the Rubber Chemists Are Doing.

INVESTIGATIONS OF THE VULCANIZATION PROCESS.¹

DR. A. W. VAN ROSSEM, Director of the Institute of the International Association for Rubber Cultivation in the Netherlands Indies, has compiled the Institute studies of the influence of various factors on the vulcanization process. The studies here reported were restricted to the treatment of hot vulcanization only. Following brief introductory remarks on the well-known objects and results of the vulcanization process, the influence of various important factors are considered. The results obtained are given below in condensed form.

INFLUENCE OF THE METHOD OF PLASTICIZING AND WASHING ON THE VULCANIZATION COEFFICIENT.

There is no doubt that very intense plasticizing can be carried out without having any influence on the velocity of vulcanizing, as appears from results expressed in terms of the vulcanization coefficient of a mixture of 92½ parts Hevea crepe and 7½ parts sulphur, cured according to the standard method. (THE INDIA RUBBER WORLD, September 1, 1918, page 723.)

INFLUENCE OF PLASTICIZING ON RELATIVE VISCOSITY AND VELOCITY OF VULCANIZATION.

Way of Plasticizing	Relative Viscosity 5% Solution in Benzine of Plas- ticized Mixture.	Vulcanization Coefficient.
Normal	177	2.25
10 times extra	123	2.29
30 times extra	85	2.28
60 times extra	63	2.28

The marked decrease of viscosity shown in the table is notable. This decrease takes place at a slower rate when the manipulation is carried out without rest. In this case the period of rest was short and had little influence. If the rubber is allowed to cool, as over night, it is much more affected when milled again. Probably on much longer plasticizing a greater decline of viscosity will take place.

Whereas, Weber², and Spence and Ward³ find that the velocity of vulcanization is independent of the duration of plasticizing, Axelrod⁴ finds that strongly plasticized rubber takes up more sulphur than the normally treated. No indication of this fact with very strongly plasticized rubbers was found at the Institute.

There is no doubt that on the washing rolls rubber is depolymerized in a way corresponding to that on the mixing rolls but also there may be removed by washing substances which affect the velocity of vulcanization. This has been proved with certainty by the Institute for Pará rubbers and also for special rubbers prepared according to evaporation processes.

TIME OF CURE AND THE VULCANIZATION COEFFICIENT.

It appears that the quantity of combined sulphur increases about in proportion to the duration of the vulcanizing time.

TEMPERATURE AND THE VULCANIZING COEFFICIENT.

From the tabulated results of three series of experiments on the same rubber and sulphur mixing it is deduced that the temperature coefficient for an interval of nine degrees C. is greater than two. With ten degrees difference of temperature the results diverge more, and with six degrees difference, have a greater tendency to similarity. Consequently it may be safely assumed that for temperatures not varying much from the technical ones, van't Hoff's rule will prevail, namely, that the temperature coefficient is between two and three. Whether this

holds for temperatures below 100 and above 160 degrees C. remains to be investigated.

ADDED SULPHUR AND THE VULCANIZATION COEFFICIENT.

This matter was studied on mixes of rubber and sulphur ranging from 2½ to 20 per cent of sulphur, vulcanized at 50 pounds of steam for 1½ hours. The results show that there is a direct relation between the coefficient of vulcanization and the sulphur present.

VISCOSITY OF RAW RUBBER AND THE COEFFICIENT OF VULCANIZATION.

There exists for first latex rubbers a close correlation between the viscosity of the raw product and the velocity of vulcanization. This correlation is striking because the rubber has been strongly depolymerized before devulcanization, even with the normal way of working. All first latex rubbers will probably be depolymerized on prolonged plasticizing to an identical degree of viscosity. In practice a highly viscous rubber will be less depolymerized before vulcanization than a less viscous one. The above-mentioned correlation, however, does not become less striking in consequence, for it has been seen above that the velocity of vulcanization is independent of the amount of plasticizing. It is very probable, in view of experimental results, that rubber low in viscosity vulcanizes much more slowly than highly viscous rubber.

In order to throw light on the influences which dominate the process of transforming pure raw rubber into the cured product the following points were investigated: (1) Is increase of breaking load attributable to less depolymerization of the rubber before vulcanization? (2) Is increase of breaking load due to the specific property of building up more quickly while being vulcanized in the case of a rubber of higher viscosity number?

Experimentally it was found that a test piece made from a brand of rubber whose solution shows a high viscosity number, becomes stronger than one made from a species which gives a less viscous solution, because the inherent properties of the first cause it to vulcanize with greater rapidity. Under normal circumstances such a test piece becomes still stronger, because the highly viscous rubber is far less depolymerized during the same amount of work exerted upon it by the mixing rolls than a rubber which is less viscous.

INFLUENCE OF THE PERCENTAGE OF RESIN, ASH, NITROGEN AND THE DEGREE OF ACIDITY ON THE VULCANIZATION COEFFICIENT.

Opinions are divided as to whether the presence of resin is an advantage to vulcanization of rubber or not. The work of the Institute, by Van Heurn, indicates, without restriction, that with standard vulcanization the influence of resin on the mechanical properties of rubber is to lower the breaking strength.

Later, on elaborating numerous data, Van Rossem found the peculiarity of first latex rubbers, that there exists a correlation between the percentage of resin and the velocity of vulcanization and that with the increase of the resin percentage, velocity increases on the average. Though the correlation coefficient has a comparatively low value, still there is a distinctly positive correlation between the percentage of resin and the vulcanization coefficient. That this correlation exists is especially remarkable because from Van Heurn's tests just mentioned, it appeared that the addition of rubber resins causes the breaking strength to decline and elongation at break to increase.

The way the resins can affect the mechanical properties of rubber was revealed by a study of elongation diagrams and led to the following conclusions:

1. By extracting the resin a change in mechanical properties

¹Communications of the Netherlands Government Institute for advising the Rubber Trade and the Rubber Industry—Part VI.

²"The Chemistry of India Rubber," 1902, page 16.

³"Kolloid-Zeitschrift," 11, 1912, page 278.

⁴"Gummi-Zeitung," 24, 1909, page 352.

takes place requiring more strain to produce the same elongation, because the rubber gains in stiffness.

2. After adding the extracted resin the original diagram of elongation is recovered except that the curve does not extend quite as far.

3. Addition of double the quantity of resin produces a greater elongation for the same stress, the rubber thus having become more "supple."

It should not be lost sight of that the contradiction between the above-mentioned positive correlation and the influence of resins may be apparent, no corresponding vulcanization coefficients having been determined. It is possible that the resins have an accelerating influence on the binding of sulphur, or they may cause a marked decline of the mechanical properties.

It should further be noted that by "percentage of resin" is denoted the acetone extract, and that these terms are not identical, as the acetone extract also contains non-resinous or nitrogenous compounds. Possibly some of the ingredients of this acetone extract have an accelerating effect and it may be because of this that the correlation between velocity of vulcanization and percentage of resin is not more distinct.

From the data for 214 samples of first latex crêpe Van Rossem found that there exists in general no correlation between the percentage of ash in the raw rubber and the velocity of vulcanization.

From 134 samples he determined that there exists no correlation between the nitrogen percentage of the raw rubber and the vulcanization coefficient.

In this respect Clayton Beadle and Stevens have shown that the insoluble part, rich in nitrogen, accelerates vulcanization, and Stevens found that different nitrogenous compounds, such as peptone and casein, act in the same way. These tests retain their value, but, according to the preceding, the more or less accelerating action of the so-called insoluble part may no longer be attributed to the nitrogen percentage. This does not mean that artificially added nitrogenous compounds may not act on the velocity of vulcanization, nor should it prevent other natural ingredients in the raw rubber from acting in a similar way.

No correlation exists between the degree of acidity of the rubber and the velocity of vulcanization. This is somewhat surprising, since acid acts to retard the velocity. In the meantime it should be remembered that the degree of acidity can be only incompletely determined.

FILLERS AND ACCELERATORS AND THE VULCANIZATION COEFFICIENT.

The addition of not too large quantities of inorganic fillers which are inactive in respect to sulphur, does not practically change the velocity of vulcanization.

Whether an inorganic or an organic material will act as an inert filler or as a catalyst in the vulcanization process is uncertain of prediction. The action of old ground rubber, reclaimed rubber and rubber substitutes is a study of great importance, but this for the present is prevented by a number of difficulties.

(To be continued.)

METHODS OF ANALYSIS.

DETERMINATION OF FREE CARBON IN RUBBER GOODS.

A. H. SMITH and S. W. Epstein, of the Bureau of Standards, read before the Rubber Section of the American Chemical Society at Cleveland, September 10 to 13, 1918, a paper on the determination of free carbon in rubber goods. Following is an abstract of their investigations and conclusions and their method of analysis in full:

The authors state that the main object in the determination of free carbon in rubber goods is to permit the determination of the rubber content by difference. The most widely used method for the determination of rubber is to calculate it as the difference between 100 per cent and the sum of ash, total sulphur, and various extracts. This method is subject to wide

error when free carbon is present and no allowance is made for it.

The nitric acid methods of Henry William Jones¹ and of W. A. Caspari² were not found entirely satisfactory. The authors have found that the action of nitric acid is to attack the carbon of lampblack and gas black and it is necessary to correct the analytic results as obtained by ignition loss to compensate for the error caused by the formation of compounds from the free carbon. The attack of amorphous carbon by nitric acid renders an accurate determination by this method impossible, but the error is sufficiently uniform and small to allow practical determinations.

DETAILS OF METHOD AS FINALLY ADOPTED.

Extract a one-gram sample for six hours with acetone and then for three hours with chloroform or carbon bisulphide. Transfer the sample to a 250 cc. beaker and heat on the steam bath until it no longer smells of chloroform. Add a few cc. of hot concentrated nitric acid and allow to stand in the cold for about 10 minutes. Add 50 cc. more of hot concentrated nitric acid, taking care to wash down the sides of the beaker. Heat on the steam bath for about one hour or until the disappearance of all bubbles or foam from the surface. Pour the liquid, while hot, into a Gooch crucible containing a fairly thick pad of ignited asbestos. Filter by applying gentle suction and wash well with hot concentrated nitric acid. Empty the filter flask, wash the filter alternately with acetone and benzol until the filtrate is colorless. Next wash it well with a hot 15 per cent solution of sodium hydroxide. Test for the presence of lead by running some warm ammonium acetate solution, containing an excess of ammonium hydroxide, through the pad into a solution of sodium chromate. If a yellow precipitate forms, the pad must be washed with the ammonium acetate solution until the washings no longer precipitate the sodium chromate solution. Next wash the residue well with warm five per cent hydrochloric acid solution. Remove the crucible from the funnel, taking care that the outside is clean, and dry it in an air bath for 1½ hours at 150 degrees C. Weigh, burn off the carbon at a dull red heat, and reweigh. The difference in weight represents approximately 105 per cent of the carbon originally present in the form of lampblack or gas black.

It is recommended that 0.5-gram samples be taken for compounds containing over ten per cent of free carbon and one-gram samples be taken for compounds containing less than this amount.

AUTHORS' REMARKS ON METHOD.

The factor of 105 per cent as a ratio between the ignition loss and the amount of carbon present was arrived at from the results of a large number of determinations made at the Bureau of Standards. Gas black determinations ran from 101 to 106 per cent and lampblack determinations from 100 to 108 per cent. Results were obtained on different samples containing large amounts of mineral rubber, lead (both in the form of oxide and sulphate), reclaimed rubber of various kinds, glue, substitute, sulphides of antimony, talc, etc. In all cases the results came between 101 and 108 per cent of the carbon originally present. By using the factor of 105 per cent, the maximum divergence is four per cent and the usual divergence very small.

In our analysis of the gas black and lampblack used in our experiments, we determined the volatile loss at 100 degrees C., the acetone extractable matter, and the ash, and assumed the remainder of our samples to be carbon. Our results have been calculated to this basis, and justify the method for routine laboratory use.

¹Fourth International Rubber Congress.

²India Rubber Laboratory, Pretoria.

Replete with information for rubber manufacturers—Mr. Pearson's "Crude Rubber and Compounding Ingredients."

CHEMICAL PATENTS. THE UNITED STATES.

LIQUID COATING COMPOSITION.—A liquid coating composition comprising linseed oil, rosin, gutta percha, gum arabic, shellac and gasoline in prescribed proportions. (Frank Picard, Fall River, Mass. United States patent No. 1,281,650.)

CATALYST.—As a new catalyst for hardening oils, finely divided poreless native amorphous silica of the character of that occurring in asbestos deposits, such silica being of a fineness as high as 400-mesh and carrying reduced nickel. (Alexander Schwarzman, assignor to Kellogg Products, Inc., both of Buffalo, N. Y. United States patent No. 1,282,297.)

RUBBER COMPOSITION AND METHOD.—Vulcanized compositions and products of light color, which comprises incorporating with a vulcanizable ingredient of the composition to be vulcanized, a light-colored semi-solid to solid bitumen, obtainable by the destructive distillation of coal-tar pitch, and subjecting the composition to vulcanization. (John M. Weiss, assignor to The Barrett Co., both of New York City. United States patent No. 1,282,505.)

GERMANY.

REGENERATING OF VULCANIZED RUBBER.—The regeneration of soft vulcanized rubber is effected as follows: Vulcanized rubber is heated to a high temperature; without melting, in a vacuum or in an inert gas, and the harmful effect of the air on heated rubber is avoided by rapid cooling; for example, by treatment with cold water, or solutions of sodium carbonate or alkali. (B. J. F. Vanhorst, The Hague, and J. G. Fol, Delft, Netherlands Indies. German patent No. 302,995, March 19, 1914.)

THE DOMINION OF CANADA.

PROCESS OF MAKING RUBBER SPONGES.—A process for producing an antimony-colored rubber sponge of low specific gravity comprising a batch of material including chiefly rubber, to which is added a softening agent, sulphuretted antimony, a rubber substitute and a softening medium containing a blowing agent acting late in the period of vulcanization, and a softening medium acting when cold to stiffen the mass and having substantially no retarding effect upon the reformation of the mass during vulcanization. With this mass is mixed a body-forming medium of low specific gravity, the main blowing agent and an ingredient for retarding the blowing action in the first stages of vulcanization. This mixing is worked until it reaches the consistency of soft putty and after aging is formed into the desired shape and vulcanized. The cured article is mechanically compressed to break its unbroken cell walls, and finished by trimming off the skin, exposing the porous body. (The Miller Rubber Co., assignee of Richard Griffith and Charles F. Flemming—all of Akron, Ohio, U. S. A. Canadian patent No. 186,291.)

THE UNITED KINGDOM.

LEATHER SUBSTITUTES.—A coarse felt impregnated and covered with a mixture of leather powder, vulcanized rubber powder, and free sulphur heated to a semi-liquid state, with which may be incorporated rosin, sodium silicate, and coloring matter. After mixture and heating, the material is forced in semi-liquid condition into the open pores and coated on the surface of coarse felt and cooled until solid. (J. Ward, 31 Gratton Road, Queen's Park, Bedford, England. British patent No. 119,304.)

TIRE PUNCTURE COMPOSITION.—A composition for sealing pneumatic tires, etc., consisting of the following ingredients, the preferred proportions being as stated, namely: water, two parts; granulated cork, four ounces; powdered cork, two ounces; talc, one pound; white lead, eight ounces, and gum arabic, two ounces. (W. P. Thompson, 6 Lord street, Liverpool, England. [Puncture Cure, Limited, 19 Union Bank Building, Calgary, Canada.] British patent No. 119,324.)

LABORATORY APPARATUS. BURETTE-CALIBRATING PIPETTE.

SPECIAL burette-calibrating pipette has been perfected by C. W. Fouk, of the Department of Chemistry, Ohio State University, Columbus, Ohio, and interestingly described by him in a reprint from an article originally published in the "Journal of Industrial and Engineering Chemistry,"

August, 1915, page 689. The illustration shows the pipette attached to the outlet of a burette to be calibrated. All previously described burettes of this sort have had a mark on the lower stem which served as a zero point. In the present instance it is evident, as the accompanying figure will illustrate, that if the pipette has previously filled and emptied, the flow will begin at the top of the boring through the plug of the cock at A. Thus the point A is a zero mark to which the adjustment of liquid is automatically regulated by the position of the cock. This zero point is more accurate than a mark around the lower stem would be on account of the boring. (The Kauffman-Lattimer Company, Columbus, Ohio.)

BURETTE-CALIBRATING
PIPETTE.

A NEW COMBUSTION BULB.

A very convenient and easily cleaned combustion bulb is here shown. It is extremely simple in construction and has no stop-cocks to work loose and leak, or stick tight and cause breakage by attempted removal. It weighs about 125 grams when fully charged and has a demonstrated capacity of absorbing up to four grams of carbon dioxide without loss when the gas current is flowing at the rate of 500 c.c. per minute. (The Kauffman-Lattimer Co., Columbus, Ohio.)

COMBUSTION
BULB.

HIGH VACUUM PUMP.

The most recent development in high vacuum pumps for laboratory and commercial purposes is represented by the Cenco-Nelson pumps. They are compact, operate with very small expenditure of power, require no attention when in operation and

last indefinitely. They measure about seven inches high by five inches in diameter at the base and weigh about ten pounds. The two-stage pump contains two pairs of gears, arranged one above the other. The upper pair takes the air from the inlet tube and delivers it out through the exhaust. The three-stage pump contains three pairs of gears similarly arranged and produces a higher vacuum. To offset the heating effect in operation a water circulation system is provided. (Central Scientific Co., 460 East Ohio street, Chicago, Illinois.)

HIGH VACUUM PUMP.

BARIO.

Bario metal is a successful substitute for platinum for laboratory crucibles and other utensils. Bario is a brilliant grayish-white, non-magnetic metal, melting at 3100 degrees F., and upwards, according to grade. It is not attacked by nitric, sulphuric, hydrochloric, hydrofluoric, acetic or oxalic acids, nor by alkalis, sea water, ammonia, iodine, etc. (The Bario Metal Corp., 167 West 18th street, New York City.)

New Machinery and Appliances.

THE W-S-M HYDRAULIC SOLID-TIRE PRESS.

A NECESSARY part of the equipment of truck service stations and garages is a solid-tire applying press. Speed, simplicity and strength should be the prominent characteristics of this machine that must be always ready and efficient and require but little mechanical knowledge in the operation of mounting and demounting tires.

Such specifications are embodied in the press shown in the accompanying illustration. It operates by hydraulic pressure and is built in two sizes with 150 and 200-ton pressure ratings. The frame construction and strength of the fittings are amply able to take care of the occasional serious overloads that are demanded in service.

To mount a tire the ram is lowered, the wheel is placed on lower platen, with the tire in position above it. The belt is thrown onto tight pulley, and the control valve closed.

To demount the tire a ring is placed on the lower platen, just large enough to clear wheel, which is placed upon it. A second ring, or a set of blocks as is sometimes used, is placed on the circumference of tire. The control valve is then closed, and the tire pressed down off of wheel. (The Wellman-Seaver-Morgan Co., Akron, Ohio.)

Mounting Tire—Beginning of Stroke.

TWO-DIP SPREADER FOR CORD FABRIC.

This machine is particularly designed for coating cord fabric, providing two coats with a short drying operation between the two immersions and a somewhat longer and more thorough process after the second coat.

The let-off for handling the fabric is carried on a separate stand on the feed end of the machine, delivering the fabric to the machine under a light tension. The fabric passes through the first tank and receives a heavy coat of cement, the excess being removed by a scraper bar, and the pressure being regulated by a spring. The fabric is then carried over two vertical steam-coils and partially dried before being delivered to the second tank, at which point it is given an additional coat. It is then thoroughly dried over a bank of four vertical steam-coils and delivered to an external wind-up stand which also carries a friction let-off for the liner.

The fabric in passing through the machine is driven by six rolls carried on the bottom framework on plain bearings and driven by an endless belt. Idler rolls are provided over each drying section and are mounted on ball bearings, the first four rolls being of the spreader type, insuring a smooth finish.

Drying coils, tanks, driving and idler rolls are all mounted on an angle-iron frame which is rigidly braced and supported.

This framework is enclosed except for a short distance above the floor line by a sheet-metal cover, the driving side of which consists of removable doors. The side section includes a con-

A CORD-FABRIC SPREADER AND DRIER.

nection for an exhaust fan to assist in removing the vapor.

Due to the inflammable nature of the cement and vapors, it is usual to provide a separate building isolated from the main plant. For this reason the machine has been designed for countershaft drive so that the cement churns and exhaust fan may be driven from the same motor. (The Turner, Vaughn & Taylor Co., Cuyahoga Falls, Ohio.)

THE LARGEST TUBING MACHINE.

Tubing machines are invaluable in making a great variety of rubber products that range from the smallest rod to the largest solid tire. That the mechanical development of these machines has kept pace with the manufacturing demands is shown by the accompanying illustration of the largest tubing machine. It is interesting to compare this 1918 product with the

THE ROYLE PERFECTED TUBING MACHINE

original Kiel tubing machine, built in 1876, and shown elsewhere in this issue.

The Royle perfected tubing machine was built for making solid tires and has a cylinder bore of 9 inches. The die limits are 3 to 6 inches. Extra large dies of 8 3/4 inches may be used. The machine weighs 18,000 pounds and occupies a floor space

of 48 by 158 inches. It is driven by a 100-horse-power motor and reduction gear. (John Royle & Sons, Paterson New Jersey.)

THE BRUSH CLOTH STRETCHER.

Many kinds of fabrics are used in making certain rubber products, and require special treatment before and after calendering or proofing, that of stretching being quite important. For this purpose the brush cloth-stretcher here pictured is recommended, as it smooths out the cloth and improves the finish of the goods. It is used to advantage on balloon cloth during the process of coating, and works equally well for stretching and removing wrinkles from tire-building fabric, breaker fabric, sheetings, drills and stockinet. Rubberized materials or tacky goods can be smoothed and stretched on this machine, without damage to finish, during the process of spreading.

The principle of stretching cloth from the center toward the selvage with this device is said to differ from that of any other employed for a similar purpose. The bristled rolls are made up of disk units, into which the bristles are set at an angle.

BRUSH STRETCHER THROWN OFF DRUM OR CALENDER ROLL

These disks are assembled and firmly locked upon a shaft, so that the bristles point outward from the center of the shaft. The mounted shafts are hung upon a frame designed to allow the application of the bristled rolls to the drying cylinders or calender rolls or other surface, at any desired pressure, which is regulated according to the nature of the fabric to be stretched and the amount of stretch desired. An important feature of this stretcher is that it does not require to be threaded-up. The cloth is run on the calender roll or drum in the usual way, and the stretcher rolls are brought in contact with the goods. They may be quickly removed by a simple adjustment device. The stretcher rolls are not mechanically driven, but revolve when brought in contact with the moving surface of the goods. Each bristle catches a different thread of the fabric at the same time, which has the effect of pushing the cloth outward from the center toward the selvage without any undue strain, as the action of the multitude of bristles working in unison is absolutely uniform, and the perfect flexibility of the bristles eliminates all possibility of disturbing the finish of the goods in any way. (Sidney Birch Co., Inc., Mansfield, Massachusetts.)

PROCESS PATENTS.

- N. O. 1,281,374. Balloon manufacture and varnishing. H. E. Honeywell, St. Louis, Mo.
 1,282,160. Tire repairing. G. E. Raylock, Baltimore, Md.
 1,282,259. Sealing ends of rubber hose. J. W. Young, assignor to The Goodyear Tire & Rubber Co., both of Akron, O.

MACHINERY PATENTS.

PNEUMATIC SHOE-PRESS.

THIS invention consolidates the parts of a rubber boot or shoe before vulcanization, by the action of compressed air or a suitable fluid under pressure and control by the operator.

GAMMETER'S SHOE-PRESS.

The receptacle A is provided with a hinged cover B of the breech-block type. A cup-shaped conoidal last support C is lined with soft rubber that accommodates different lasts and seals the chamber by means of the end of the last. The adjustment for different lengths of lasts is effected by the movement of the last support that slides in the cylinder D. The stem of the last-support has a left-hand

thread screwing in the end of E, which has a right-hand screw connection with the cylinder-wall exterior and adjustable by handwheel F. A spring plate G forms a back-rest for the lasted shoe.

A last with a shoe thereon is placed in the chamber with the top of the last resting in the last-support, and the back of the heel resting against the back-rest. The cover is then closed and locked and the compressed air turned into the chamber, its effect being to force the last more tightly into the packing member and also to press the shoe tightly against the surface of the last. The air between the shoe and the last is expelled through the vent holes and the parts of the shoe are consolidated by the difference between the pressure of the atmosphere on the inside of the last and the external pressure in the chamber. When the operation is completed the chamber is opened and the lasted shoe removed and vulcanized in the usual way. (J. R. Gammeter, Akron, Ohio, assignor to The B. F. Goodrich Co., a corporation of New York, United States patent No. 1,283,144.)

Rubber-Producing Weeds in Germany.

IN the fall of 1906 the Editor of this journal was in Hanover, Germany, the guest of the late Dr. Adolph Prinzhorn, one of the founders of the Continental Caoutchouc & Gutta Percha Co. Dr. Prinzhorn in addition to his knowledge of rubber manufacture had studied crude rubber production thoroughly in South America, Africa and in the Far East. Speaking of crude rubber supplies for Germany, if for any reason wild and plantation sources failed, he said:

We have done much in synthetic rubber, and if forced to do it could make it in quantity in times of peace. If we were at war, however, the basic materials for such manufacture would not be available. Therefore, I do not believe that we could depend upon synthetic rubber. There are, however, as you know, many lesser producers found in the temperate zone, as the milkweed, for example. We have many such in Germany, Austria, Asia Minor and in Southern Russia. Were crude rubber so scarce that it sold in Germany, say, at \$10 a pound, such sources would inevitably be utilized. Indeed, they are all being examined and classified by our botanists as a possible supply if normal sources become unavailable. They also offer cultivation possibilities for rubber alone, or for rubber, fiber, and other useful by-products.

Reviewing the conversation in the light of the present situation in Germany, it is wonderfully interesting. Very little rubber from the Amazon, from Africa, or from the great plantations in

THE "SICILIAN ARTICHOKE."

The *Abtractylis gummiifera* L. is a composite, similar to the artichoke in appearance, and yields considerable rubber. It is not found wild in Germany proper, but was cultivated there. The root analyses as follows:

	Per Cent.
Rubber	36.46
Resin	\$1.32
Organic impurities	1.40
Inorganic	2.31
Albumen	4.07
Moisture	4.24

THE SPINDLE TREE.

The genus *Euonymus*, of which there are found three varieties, is very common all over Europe. It is commonly known as the Spindle tree. Of the three varieties, *E. europaeus* L., *E. vulgaris* Scopoli, and *E. angustifolius* Vill., none are thought to contain enough rubber to warrant extraction.

THE SOW THISTLE.

Of the three species, the *Sonchus oleraceus* L. is the most promising. Dr. Kassner, in the "Chemiker-Zeitung," more than 20 years ago declared that it was worthy of serious attention. The plant, according to his analysis, contained valuable green and yellow dyes, wax, a flexible wool useful in paper manufac-

SONCHUS OLERACEUS.

ABTRACTYLIS GUMMIIFERA.

EUPHORBIA CYPARISSIAS L.

the Middle East has been received by the Central Powers since 1914. The amount that was smuggled in through neutral countries was so small as to be practically negligible. Furthermore, crude rubber sold in Germany at \$12 per pound. In spite of this, much rubber was used. Zeppelins, observation balloons, air-planes, submarines, field telephones, and scores of other war appliances used rubber up to the last. Was it largely synthetic rubber or was it obtained from shrubs and plants grown in Germany?

Of German plants known to contain rubber there are several that have attracted attention. Indeed, fully 20 years ago the idea of growing rubber in Europe was seriously discussed. Several indigenous *Compositae*, *Apocynaceae* and *Euphorbiaceae* were found which yielded rubber or a rubber-like gum. Among these are *Sonchus oleraceus* L., or Laiteron, of Central Europe; the *Abtractylis gummiifera* L., of Sicily, and in Germany the Arzreibush and the Wolfmilk group, *Euphorbia palustris* and *Euphorbia cyparissias*, together with the *Euonymus Europa*, a dogwood known as Fusain or Spindle tree.

ture, and india rubber. The bagasse, consisting of more than 60 per cent of the whole, formed an excellent fodder with a proportion of 2½ per cent of nitrogen and 15½ per cent albumen. The sow thistle, originally a native of Europe, is now found in the temperate zone nearly all over the world, and is often carelessly called milkweed.

THE WOLF-MILK TREE.

Three native *Euphorbias*, or wolf-milk trees, the *E. pilosa*, *E. palustris* and *E. cyparissias*, are found in Central Europe, and all contain rubber.

According to Scheermesser, these *Euphorbias* are well worth exploitation. His procedure was to gather the nearly matured plants, dry and grind them to a coarse powder. This was treated with a solvent. The extract, dark-green and pungent, contains a rubber-like substance and fat. It was estimated that one hectare (2.47 acres) of *E. cyparissias* would produce 50 kilos (110 pounds) of rubber and 140 kilos (309 pounds) of fat. The latter is useful in soap manufacture, and is said to have food value also.

ANOTHER RUBBER WEED.

There is still another plant, a pest in times of peace, that has been examined for the rubber it contains. It is the *Tithymalus pepulus*. Cultivated and treated in the same manner as the *Euphorbia*, it produces per hectare 43 kilos of rubber and 120 kilos of fat. Not quite as good as the *Euphorbia*, but perhaps worth exploitation when labor is forced, fats almost unobtainable, and rubber worth \$12 a pound.

THE EDITOR'S BOOK TABLE.

FUNGI AND DISEASES IN PLANTS. BY F. J. BUTLER, M.B., F. L. S. Thacker, Spink & Co., Calcutta and Simla, India. (Cloth, 64 pp., 9 1/2 inches, 206 illustrations, 547 pages.)

THIS valuable handbook on the crop diseases of India caused by fungi is practically if not actually the first in an important and unexplored field. It was intended that the book should be primarily for the use of the trained staff of the Agricultural Departments in India, but will be found useful to every planter and to students of plant diseases. The book deals with field and plantation crops only. It is divided into two parts, the first of which comprises a general treatment including chapters on the nature of fungi; the food of fungi; life-history of parasitic fungi; the causation of disease by fungi, and the principles of the control of plant disease. The second part treats of special diseases of many Indian crops, concluding with a chapter of the diseases of rubber (*Hevea*, *Manihot*, *Castilloa* and *Ficus*).

Ten rubber-tree diseases are minutely described in their various phases, and methods of control are suggested where known. The well-known "pink disease" and "black thread" are stated by the author to be, at present, the most serious diseases of *Hevea* in India.

THE NETHERLANDS INDIA RUBBER YEAR BOOK, 1918-1919. Second edition. Published (in Dutch) by the "Netherlands India Rubber Journal," Batavia, Java. (Octavo, 282 pages.)

This little reference work gives information about rubber growers and rubber traders' associations in the Dutch East Indies and elsewhere, about experiment stations, relief funds and trade unions. It also furnishes ready-reckoning tables, rubber statistics, information about rubber markets, and a small dictionary of terms used in the rubber trade to enable Dutch East Indians to understand words they may find in trade publications printed in Dutch.

NEW TRADE PUBLICATIONS.

THE LINK BELT CO., CHICAGO, ILLINOIS, HAS ISSUED A HANDSOME 52-page booklet devoted to "Economic Handling of Coal and Ashes, and Reserve Coal Storage," with many explanatory diagrams and half-tone illustrations. It is not a catalogue, but a description of improved fuel-handling devices in many of the best industrial power-plant installations of the country, and it will be studied with interest and benefit by rubber men contemplating new plants, additions or improvements.

* * *

THE GENERAL MAGNESITE AND MAGNESIA CO., PHILADELPHIA, Pennsylvania, has issued for the convenience of rubber workers a neat four-page loose-leaf folder of heavy celluloid containing tables of factors for determining specific gravity of rubber compounds. The first table gives the volume ratios corresponding to unit weights, from one to nine, of the ordinary compounding ingredients. Similarly the second table gives volume ratios for unit weights from one to nine, corresponding to specific gravities from 1.00 to 1.70. The use of these data is explained by directions and calculated examples.

* * *

THE CENTRAL SCIENTIFIC CO., 460 EAST OHIO STREET, CHICAGO, Illinois, has issued a complete illustrated catalog of laboratory apparatus (Catalog C). All kinds of apparatus listed are "Made in America" and include a full line of everything used in testing laboratories.

RUBBER TRADE INQUIRIES.

THESE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(679.) A reader inquires for the address of the manufacturer of "Victor" tennis shoes.

(680.) Requests have been received for the addresses of manufacturers of zinc collars and caps for ice bags.

(681.) A foreign correspondent asks for the addresses of manufacturers of elastometers and durometers for rubber testing.

(682.) A manufacturer requests the address of manufacturers of rubber machinery for making seamless, transparent rubber nipples.

(683.) An inquiry has been received for the address of manufacturer of compounding lubricant sold in Canada under the name "Kastroleum."

(684.) Information is requested as to makers of elastic-band cutters. Prices and time of probable delivery of such machines are also asked for.

(685.) Inquiry is made for quotations on power-driven shears or machinery suitable for cutting rubber tubing two inches in diameter.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce or its district or cooperative officers. Request for each should be on a separate sheet, and state number.

(27,687.) The manager of an organization in Switzerland desires an agency for the sale of automobile accessories on a commission basis. Correspondence may be in English.

(27,691.) A man in Switzerland desires an agency for the sale of automobile and truck accessories. Correspondence may be in English.

(27,740.) A representative of an Australian firm, who is in this country, desires an agency for the sale of hat elastic, 8 or 10 cord (black or white).

(27,748.) A man from Peru, at present in the United States, wishes an agency for the sale of automobile accessories. Correspondence may be in English.

(27,762.) An importer and commission agent in Southern Italy desires an agency for belting.

(27,791.) A man in France wishes to secure an agency on sale of rubber goods of all kinds, automobile casings and inner tubes, waterproof cloth and clothing, and heavy rubber blocks for machinery.

(27,779.) A company in Canada desires to purchase or to secure an agency for automobile accessory specialties. Terms, cash against documents for either purchase or agency.

(27,790.) A firm in Brazil wishes to secure an agency for the sale of belting. Quotations to be f.o.b. New York. Credit terms, 120 days required. Correspondence may be in English.

(27,791.) A man in France wishes to secure an agency on commission for the sale of balata belts. Correspondence should be in French.

(27,796.) Two men who are to form a partnership in France desire an agency for automobile and truck accessories. Correspondence may be in English.

(27,810.) A company in Norway desires to purchase and secure an agency for the sale of rubber shoes. Cash will be paid. Correspondence may be in English.

(27,811.) A commission agent in France will represent firms for the sale of motor-car and motorcycle accessories. Correspondence may be in English.

New Goods and Specialties.

A SANITARY HAIR-BRUSH.

A HAIR-BRUSH that can be sterilized is something to be desired by everybody who appreciates dainty toilet accessories. The "Maid of America" hair-brush is of this type. The bristles are vulcanized into a rubber pad and this rubber pad is removable. All that is necessary to do to remove it from the brush is to press firmly with both of one's thumbs against the side of the bristles. This springs the pad so that it can be easily removed. After the pad has been removed it can be sterilized. When replacing the pad it is only necessary to insert the heel first, catching the notch at the end where the small hole appears. The rubber then remaining out of place can be readily pressed into position. (A. Steinhart & Bro., 860 Broadway, New York City.)

"MAID OF AMERICA" HAIR-BRUSH.

SHERMAN HOSE CLAMP.

A RUSTLESS HOSE-CLAMP.

A style of hose-clamp that is made in varying thicknesses of different sizes is shown here. It is rust-proof throughout, will not injure hose, and wears for a long time. A long tongue, shaped and run in the channel, prevents the hose from bulging between the ears and insures an even grip all around. The clamp conforms to the shape of the hose. Stiff, heavy ears form the nut lock, preventing the nut from turning

when tightened; and they cannot tip together when drawn up. There are also heavy shoulders which give a good bite to vise jaws, so that the clamp can be drawn exceedingly tight. (H. B. Sherman Manufacturing Co., Battle Creek, Michigan.)

SHRAPNEL GOGGLES.

Professor Terrien, an eminent French eye specialist, and Major M. E. Cousin, observing the large number of French

RUBBER-BRIMMED EYE-PROTECTORS.

soldiers injured in the eyes, not long ago devised an eye-shield, shown herewith. The goggles are pressed from a plate of metal

one millimeter thick, convex in shape, with transverse vertical and horizontal slits underlaid with mica, for the admission of light. The brims are covered with rubber to make them gas-proof. These goggles prevent many injuries.

THE "INSIDE TYRE."

A new device to take some of the pressure from inner tubes against the outside tire of automobile wheels has been devised, which is illustrated here in section. It is made of tough fabric vulcanized over a tire mold so that it fits the inside of a tire casing exactly. The outside is coated with rubber which vulcanizes itself to the inside of the casing, thus preventing slipping, while the part that comes in contact with the tube is coated with rubber which has been treated so that the tube will not stick to it. This device increases the life of tires and can be used over again after the outside tire is worn out. (The American Automobile Accessories Co., Baltimore & Ohio Railroad and Blue Rock street, Cincinnati, O.)

A GOOD-LOOKING ACCELERATOR FOOT-REST.

A new contrivance intended to guard against unintentional rapid acceleration when driving over rough roadways or street crossings, and to relieve the foot from continuous tension, is embodied in the good-looking device shown herewith. It is composed of an indented rubber roller vulcanized to a steel tube which revolves on a steel spindle riveted to the uprights. Graduated indentations make the foot-rest adjustable to various heights and positions, the adjustment being made by means of tightening nuts. The Stanwood adjustable accelerator foot-rest is adaptable to all makes of cars and permits delicate advancement or retarding of acceleration. (Stanwood Equipment Co., 307 Plymouth Court, Chicago, Illinois.)

THE "STANWOOD" ACCELERATOR FOOT-REST.

IDENTIFIABLE TOBACCO CONTAINER.

A container for tobacco which provides a place for the insertion of an identification card and a photograph must appeal to the heart of every soldier who smokes. The one illustrated is made of waterproof material with a flap provided on the inside with a mica or similar shield to cover the identification card of the owner and a small photograph. This container will hold any stock size package of granulated tobacco and manufactured cigarettes. The original package is thus kept intact and is protected from moisture, while it keeps in one place all necessary articles. (L. Sence & Son, 110 West 14th street, New York City.)

Interesting Letters From Our Readers.

AN EXCEEDINGLY GRATIFYING LETTER.

THE Rubber Association of America is in receipt of a letter from the Rubber Trade Association of London, regarding an article which appeared in "Truth" of London, and which caused much indignation on this side of the water. That the British rubber trade were equally indignant was also at once made manifest in letters and telegrams. Now that a definite protest comes from the Associated Rubber Manufacturers in Great Britain the incident is closed, and good feeling is wholly restored. The letter follows:

TO THE RUBBER ASSOCIATION OF AMERICA, INC.:

DEAR SIRS—I beg to acknowledge with many thanks your various communications to the rubber trade.

In particular we are obliged for the reprint of the leading article from THE INDIA RUBBER WORLD in the current month's issue. That article had already excited considerable interest in the trade here, and I beg to assure you that we are in hearty sympathy with it. The whole matter was brought up at a general meeting of our Association held here to-day, when it was unanimously resolved that I should communicate the trade's opinion to you.

Perhaps I may mention that immediately these very objectionable articles appeared in "Truth" one of our committee communicated with the Editor, contradicting the statements and the whole basis of his offensive insinuations. No one here has anything but severe condemnation for the baseless charges brought by the financial journals against American manufacturers. We, at all events, thoroughly appreciate the high character and fair dealings of these gentlemen, and we can only express our great regret that papers here should lend themselves to such groundless and objectionable matter.

If you can conveniently do so, we should be greatly indebted to you if you would convey the sense of this to your members, as we consider it of great importance that they should realize clearly how strongly we feel on the subject. This is not a time when any possible misconception should be allowed to arise between us.

Yours faithfully,

FOR THE RUBBER TRADE ASSOCIATION OF LONDON.

J. D. JOHNSTON, *Chairman*.

London, England, October 30, 1918.

INFORMATION ABOUT RUBBER SUBSTITUTES IN GREAT BRITAIN.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—In the department headed "The Rubber Trade in Great Britain," in your issue of October 1, 1918, we notice a few remarks with regard to rubber substitutes, which are, in our opinion, somewhat incorrect, and are liable to cause your readers to receive a wrong impression.

As you are aware, we have been manufacturing india rubber substitutes, both white and dark, for many years past, and since the outbreak of hostilities have been supplying large quantities of the finest grades for use in connection with government contracts, and owing to the action of the Ministry of Food, Oils and Fats Branch in restricting the use of vegetable oils for certain specific purposes it was impossible for some months for any substitutes to be manufactured, and in this respect only, your correspondent is correct.

Owing to the demand for the india rubber substitutes, representations were made to the Ministry of Food by ourselves and several firms manufacturing these materials, and as a consequence an association was formed called "The India Rubber Substitute Manufacturers' Association," in order that the trade could be rationed as far as supplies of vegetable oils were concerned, and at a meeting between representatives of the association and the

Industries Sub-Committee of the War Priorities Committee this committee decided that an allocation of oils sufficient for all orders, accompanied by Priority Certificates should be made, and further, that an allocation up to 60 per cent. of the amount used in the year 1917 should be made for civil work. The action of this committee is therefore sufficient evidence to prove that the material is required for work of national importance.

Your correspondent further states that the amount of mineral matter added to the substitutes shows a tendency to increase. As far as we are concerned this is not the case. We have been manufacturing several grades of both white and dark qualities, and the finest of these contain very little mineral matter, but, of course, it is possible to obtain cheaper grades containing fairly large amounts of mineral matter.

In our opinion, india rubber substitutes should be considered more as compounding ingredients than as adulterants, because, as is well known, india rubber substitutes are incapable of being used by themselves, and further, in many cases the use of india rubber substitutes is essential to obtain certain physical results.

In conclusion we would like to add that before the war we shipped very large quantities of india rubber substitutes, particularly in white grades, to your country, which in itself is sufficient to show that the india rubber trade in the United States made use of this material to a large extent.

Yours faithfully,

TYPKE & KING, LIMITED.

W. W. KING, Director.

RUBBER-PRODUCING PLANTS IN SICILY.

TO THE EDITOR OF THE INDIA RUBBER WORLD:

DEAR SIR—For several years I have been studying, from a scientific and industrial standpoint, several rubber plants and have found that some of them, which are indigenous to Sicily and Libya, contain a good quantity of rubber for industrial use. These plants are rather abundant in a wild state and can easily be cultivated.

But to make use of these plants, and control their possibilities, I need adequate financial means, and would like to get in touch with people who would be willing to associate themselves with me in this undertaking. I am ready to furnish all necessary explanations.

I ask you therefore to communicate my wish to your readers and thank you in advance.

GIOVANNI ETTORE MATTEI.

Via Maestri d'Acqua al Massimo 5, Palermo, Sicily.

TIRE TALC AND GRAPHITE FOR INNER TUBES.

Tire talc makes the best lubricator between the inner tube and the casing. Caution should be exercised in its use, however, because if too much is used a quantity will collect in one place, generating heat and forming a weak spot. The B. F. Goodrich Co., Akron, Ohio, says that the talc should be distributed evenly over the surface; sifting on the tube when revolving is a simple and efficient method.

Graphite is an excellent lubricator for tires subjected to extra heavy duty and excessive speeds. Racing drivers use graphite, but only after sifting on to the revolving tube through a sieve made of cheesecloth. This method is necessary, otherwise several flakes of graphite might accumulate in one point thereby causing deterioration—the oil in graphite being a foe to rubber.

For the average motorist who does not run his car continuously, day in and day out, the judicious use of tire talc is recommended.

News of the American Rubber Industry.

CHARLES B. SEGAR, PRESIDENT OF THE UNITED STATES RUBBER CO.

CHARLES B. SEGER, chairman of the board of directors of the Union Pacific Railroad System, was elected president of the United States Rubber Co., New York City, at the regular meeting of its board of directors held December 5, 1918. Mr. Seger will retire from railway management and devote himself to the rubber industry. Colonel Samuel P. Colt, who has served the company for eighteen years as president, was elected chairman of the board. Lester Leland, for many years vice-president of the company, was elected vice-chairman.

Resolutions were passed by the board of directors expressing high appreciation of Colonel Colt's faithful and able services in advancing the company's annual business from \$25,000,000 to \$200,000,000; in greatly expanding the scope of its manufactures, notably in tires; by acquiring other companies; in making direct provision for the production of a substantial part of its crude rubber on its own plantations in Sumatra; and in the permanent funding of the company's large indebtedness.

The control of the company remains the same as for many years. Colonel Colt will continue to direct the financial policy, with more time to devote to special work for the benefit of the company. Mr. Leland, long with the company, is known to be in hearty accord with Colonel Colt's policies. Under the by-laws revised last year Mr. Seger, the newly elected president, will have direct charge of operation.

NEW INCORPORATIONS—1918.

Connecticut Tire & Rubber Co., Inc., December 18 (New York), \$2,000. H. S. Hartstein, 250 Havemeyer street, C. S. Weldon, 591 7th street, M. Kittay, 723 Monroe street—all of Brooklyn, New York. To manufacture tires, etc.

Highland Rubber Corp., December 18 (New York), \$50,000. L. R. Eastman, 116 West 39th street, C. L. Eastman, 213 West 40th street, D. D. Deutsch, 1789 Broadway—all of New York City. To deal in tires and tubes.

Hygeia Respirator Co., The, December 11 (New Jersey), \$35,000. N. Schwartz, 251 West 34th street, New York City; L. Schwartz, 32 Monroe street, B. Spitzer, 21 Monroe street—both of Passaic, New Jersey. Principal office, 32 Monroe street, Passaic, New Jersey. Agent in charge, L. Schwartz. To manufacture, buy and sell gas-masks.

Keystone Solethier Corp., December 3 (New Jersey), \$25,000. G. H. Bruce, 320 Broadway, New York City; D. Stone, 524 Ingham avenue, Trenton, New Jersey; F. J. Bruce, 286 Sixth avenue, Brooklyn, New York. Principal office, 524 Ingham avenue, Trenton, New Jersey. Agent in charge, D. Stone. To manufacture synthetic and artificial leathers, floor coverings, gasket sheeting and combined rubber and fiber products of all varieties.

Ninigret Mills Co., The, November 20 (Rhode Island), \$550,000. F. E. and C. S. Fowler and C. Perry—all of Westerly, Rhode Island. Principal office, Westerly, Rhode Island. To manufacture, buy, and sell all kinds of textile fabrics, including auto tire fabric.

O'Connor & Haupt, Inc., December 6 (New York), \$2,000. J. Wagner, 19th street, Elmhurst, New York; H. J. O'Connor, 1517 avenue A, W. Haupt, 325 east 51st street—both of New York City. To deal in tires and rubber goods.

Para Tire Sales Corp., December 18 (New York), \$3,000. T. O'Callaghan, Hollis, Long Island; C. W. Reynolds and W. B. Harris—both of 129 West 37th street, New York City. To sell tires.

Tire Export Co., Inc., December 5 (New York), \$2,000. S.

Bernheim, 35 Nassau street, New York City; C. A. Weldon, 591 7th street, M. Kittay, 723 Monroe street—both of Brooklyn, New York. To manufacture tires.

Universal Rubber Products Co., Inc., December 4 (New York), \$250,000. L. and G. Harrington and E. Renard—all of 1476 Broadway, New York. To manufacture tires, rubber goods, etc.

White Plains Tire & Rubber Co., Inc., December 18 (New York), \$1,000. H. S. Hartstein, 250 Havemeyer street; C. S. Weldon, 591 7th street; M. Kittay, 723 Monroe street—all of Brooklyn, New York.

RUBBER FLOORING EXHIBIT.

The United States Rubber Co., New York City, made a very interesting exhibit of rubber tiling and matting at the National Hotel Men's Exposition held in Madison Square Garden, New York, December 16 to 21. The display consisted of "Usco" molded sheet rubber flooring, stair treads and perforated matting. The flooring is made in a wide range of designs and color

EXHIBIT OF THE UNITED STATES RUBBER CO.'S MECHANICAL GOODS DIVISION.

effects and is rapidly increasing in popular favor. Owing to its excellent wearing quality and security of footing it is replacing carpets on marble stairs in many of the large hotels and theatres. Areas totaling from 1,000 to 5,000 square feet are in service in several of the principal hotels in New York City.

Another interesting feature was the "Usco" non-slip stair tread which is secured in place by means of rubber cement and requires no drill holes or metal nosings.

The exhibit was in charge of Albert C. Heyman, sales manager of the United States Rubber Co.'s tiling department for New York City and State.

J. P. DEVINE CO. EXPANDING.

The J. P. Devine Co., Buffalo, New York, manufacturing vacuum drying apparatus and equipment for rubber mills, is building a two-story brick and steel addition to its machine shop, to be 26 by 102 feet, at a cost of \$11,000. New machinery to be installed for the manufacture of special apparatus on a large scale made this extension necessary. The foundations for a new foundry are also being put in. This building will be 90 by 160 feet when completed.

CHARLES B. SEGER.

CHARLES BRUNSON SEGER, the newly elected president of the United States Rubber Co., was born in New Orleans, Louisiana, August 29, 1867. He was educated in the public schools of that city, his business experience beginning as

CHARLES B. SEGER.

office boy with Morgan's Louisiana & Texas Railway and Steamship Co., successively rising from clerk to steamship auditor, traveling auditor, and chief clerk to general auditor, he became auditor and secretary of the Galveston, Harrisburg & San Antonio Railway Co., and Texas and New Orleans Railroad and Direct Navigation Co., also holding the same offices in the Galveston, Houston & Northern Railway Co. In 1900 he went to San Francisco as auditor of

the Pacific System of the Southern Pacific Railway Co., a few years later becoming general auditor of the Union Pacific System, rising to comptroller in 1911, and being elected vice-president in 1913. In 1918 he was made chairman of the executive committee of that system.

It will thus be seen that Mr. Seger has spent the larger part of his business life in leading railway systems, but he is connected with the management of many important corporations, including the United States Trust and Mortgage Co., Western Union Telegraph Co., New York Central Railroad Co. and Illinois Central Railroad Co., being a member of the executive committees of the last two organizations mentioned. For the past two years he has been a member of the board of directors of the United States Rubber Co. and of its executive committee.

He will retire as chairman of the board of directors and as president of the several companies comprising the Union Pacific System and devote his time largely to the affairs of the United States Rubber Co. His broad general experience and his familiarity with the affairs of this company will make him eminently fit for the new and responsible duties now devolving upon him.

TRADE NOTES.

The Cutler-Hammer Manufacturing Co., Milwaukee, Wisconsin, manufacturer of electric controlling devices, held a conference in that city during the week of December 7, 1918, for the benefit of its men who direct the district office sales of wiring devices, push-button specialties, and molded insulation. W. C. Stevens, sales manager, A. H. Fleet, manager of the wiring devices department, and Edward Karl were in charge. The various district offices were represented by M. F. Coyne, Boston; F. J. Walker, New York; G. W. Donkin, Pittsburgh; C. N. Gilmore, Cleveland, and Z. S. Myers, Chicago.

The Republic Rubber Co., Youngstown, Ohio, in addition to its offices in the Singer Building, New York City, its premises at 229 West 58th street, and its service station at 213 West 64th

street, has leased a part of the building at 228-230 West 58th street, in the same city.

The Hardman Rubber Corp., Belleville, New Jersey, has acquired the business of the Endurance Tire & Rubber Co., New Brunswick, and will move to the latter place where it will make a new line of cord tires for pleasure cars and trucks, as well as tire tubes.

The G. & J. Tire Co., Indianapolis, Indiana, a subsidiary of the United States Rubber Co., New York City, is building a new warehouse.

The American Rubber Corp., New York City, has removed from 225 West 52nd street, to 1974 Broadway, where it will maintain offices and sales room. It has also opened a repair department.

The Independent Airless Tire Co. has secured a factory at Independence, Missouri, and is installing machinery which it hopes to have in operation within the next few months. The officers of the company are: E. S. Galloway, president; Eben Miller, vice-president; Harold Galloway, treasurer; and E. C. Harrington, secretary.

The Yarnall-Waring Co., Chestnut Hill, Philadelphia, Pennsylvania, manufacturer of "Yarway" power-plant devices, has acquired a three-acre tract of land at Mermaid lane and Devon street, on the line of the Chestnut Hill division of the Philadelphia & Reading railroad. A three-story stone mansion on the premises is being converted into general offices and a one-story machine shop has been erected and is now in operation.

The Norwalk Tire and Rubber Co., Inc., Norwalk, Connecticut, is making a new fibre sole composed of long-strand fibres and rubber in such a manner as to permit it to be sewed or nailed in the same way as leather soles.

The Ajax Rubber Co., Inc., New York City, at a meeting of its directors held on December 17, 1918, duly resolved to issue 20,000 additional shares of common stock, par value \$50, in order to provide \$1,000,000 additional working capital. The entire issue has been underwritten to net the company the amount needed. Stockholders of record on December 27 were entitled to subscribe for the new shares at the rate of ten for each 71 shares already held, at \$55 per share.

The Archer Cord Tire & Rubber Co., 711 15th avenue, N. E., Minneapolis, Minnesota, at a stockholders' meeting held on November 18, 1918, elected the following directors: W. P. Bigelow, William A. Bieter, Maurice A. Hessian, Frederick Graham, Dr. W. B. Cory, Thomas Wilder, and Vance Chamberlain. These, in turn, elected the following officers: W. F. Bigelow, president; William A. Bieter, vice-president; and Maurice A. Hessian, secretary and treasurer. The company will manufacture cord fabric casings and automobile tubes on a large scale, in addition to its regular cord tires. It has installed special machinery for the purpose.

The Rouden Manufacturing Co., 1361-1365 Atlantic avenue, Brooklyn, New York, makes "Liberty Brand" hospital sheeting, "Gem" metal hot-water bottles, and "Excellento" ice bags. It is one of the largest producers of ice bags in the world. It also manufactures high-grade metal caps and collars for manufacturers of druggists' sundries. This plant is unique in that it manufactures for itself all of its own varied products under one roof.

After the first of the year, J. Spencer Turner Co., 86 Worth street, New York City, will handle the product of the Lowell Weaving Co., manufacturer of Sea Island and Egyptian tire fabrics.

J. Spencer Turner Co., New York City, will move this month to 56 Worth street. The interior of the building has been remodeled, affording modern offices in the center of the cotton goods district.

VAST PEACE OPPORTUNITIES IN THE AMERICAN RUBBER INDUSTRY.

IN a recent press interview, Colonel Samuel P. Colt, chairman of the board of the United States Rubber Company, New York City, outlined at some length the vast opportunities awaiting the American rubber industry on the coming of peace. Extracts from his statement follow:

COLONEL SAMUEL P. COLT.

AMERICAN RUBBER INDUSTRY DEPENDENT ON FOREIGN COUNTRIES.

The rubber manufacturing industry in America stands about fourth or fifth in the value of its products. It is dependent wholly upon crude rubber produced in foreign countries, largely by foreign capital. The entire automobile industry rests upon the rubber industry, as that in turn is built

upon the steady flow of crude cultivated rubber from the Far East. There is probably no other industry in the United States so dependent upon foreign countries as the rubber industry.

The United States has always been the largest manufacturer of rubber goods. The value of rubber manufactures in the United States for the year 1917 was nine hundred million dollars. This is approximately seven times as much as the value of rubber manufactures in the next largest manufacturing country and more than twice as much as the rest of the world put together. In ten years the United States has increased its consumption of crude rubber from 24,000 tons to 177,000 tons, while Great Britain, the next largest manufacturer, increased from 14,000 to 26,000 tons. While Great Britain was doubling her consumption we multiplied ours by nearly seven and a half.

AMERICAN MANUFACTURERS SHOULD PRODUCE CRUDE RUBBER.

The great bulk of the capital invested in rubber plantations is British and amounts to about \$400,000,000. Some American manufacturers have made a start in growing rubber for their own uses in the Far East, but American investments in that direction amount to less than three per cent. of the total capital that has been put into the industry. It would seem that one of the lines of future development of the American rubber industry should be in the direction of production of crude rubber by the American manufacturer.

FUTURE TRADE OUTLOOK PROMISING.

The outlook in the rubber industry for the reconstruction period, aside from the development that may be necessary in American-owned rubber plantations, is most encouraging. Business has been good after all wars and this should be no exception. There is a good deal of money in the country and it is more widely distributed than ever before. Everything points to a huge demand, and the rubber manufacturers at least should look forward to a largely increased volume of business. In some lines of rubber goods, notably tires, the factories will be taxed to capacity to supply the home demand.

The adjustments necessitated by various restrictive measures and the specialization of production for war needs will be accomplished with little difficulty, and such products as are adapted to foreign markets will be pushed there, but in many cases it will be some time before the greatest foreign markets will be in a position to receive and pay for American goods. In the meantime, the far-seeing producer will make his plans for the great development of foreign business that awaits the American manufacturer.

GOODYEAR TIRE MACHINE PATENT INVALID.

FIRESTONE WINS IN UNITED STATES COURT OF APPEALS.

MILLIONS of dollars annually will be saved by automobile tire manufacturers by virtue of the decision handed down by the Court of Appeals for the Sixth Circuit, at Cincinnati, on December 13, 1918. In 1914, The Goodyear Tire & Rubber Co., through its president, F. A. Seiberling, started litigation against the Firestone Tire & Rubber Co. for infringement of alleged basic patents protecting the Goodyear tire-finishing machine, the patents being the one granted to Seiberling and Stevens, in 1904, and the one granted to W. C. State, in 1909.

The infringement suit was tried in the District Court of Cleveland, Ohio, both the Goodyear tire machine and the Firestone tire machine being set up in the court-room and operated in order to demonstrate the manufacture of the casings to the presiding judge, John M. Killets. Some twelve months later the Court decided the case in favor of the Goodyear company, giving the patents referred to such a comprehensive meaning that all tire manufacturers would have had to pay tribute to the Goodyear company in the shape of royalties if the verdict had been sustained.

The Firestone company appealed the case, furnishing bonds higher than any we have ever before recorded in patent litigation. After the appeal had been argued in the higher court, early in 1917, but before a decision had been rendered, new evidence was introduced relating to a patent granted to an inventor named Mathern in Belgium in 1906. In the basement of the Cincinnati Postoffice the Goodyear and Firestone machines were again set up and also a reproduction of the Mathern machine, using framework and many parts loaned by the Hood Rubber Co., of Watertown, Massachusetts, they having bought this machine from Mathern in 1909. The full bench of judges adjourned court to the basement to witness the working of the machines and then took the case under advisement for a year.

They have now pronounced the alleged basic patents to be invalid for want of invention, as well as for lack of combination. The Firestone company is freed from all charge of infringement, the decree of the District Court is reversed, and the record is remanded to the lower court with instructions to dismiss the bill.

DIVIDENDS.

The Apsley Rubber Co., Hudson, Massachusetts, has declared its regular semi-annual dividend of three and one-half per cent on preferred stock, payable January 1, 1919, to stock of record December 31, 1918.

The Archer Cord Tire & Rubber Co., Minneapolis, Minnesota, has declared a stock dividend of ten per cent, payable January 1, 1919, to stock of record December 20, 1918.

The Canadian General Electric Co., Limited, Toronto, Ontario, Canada, has declared its regular quarterly dividend of two per cent, payable January 1, 1919, to stock of record December 14, 1918.

The Kelly-Springfield Tire Co., New York City, has declared a quarterly dividend of \$1.50 per share on its six per cent preferred stock, payable January 2, 1919, to stock of record December 16, 1918.

PERSONAL MENTION.

J. L. L. Lane, for many years with The New York Belting & Packing Co., 91 Chambers street, New York City, has been appointed manager of its advertising department.

Frank C. Risselt, well known in the rubber trade, has been appointed manager of the new office of the Cameron Machine Co., New York City, at 503 First National Bank Building, Cincinnati, Ohio.

FRANK C. RISSELT.

W. E. Byles has reestablished his brokerage and commission business in crude rubber and general Eastern produce at 59 Broad street, New York City.

Guy E. Tripp, until recently a brigadier-general, has resigned from the Ordnance Department of the Army and resumed his former position as chairman of the board of directors of the Westinghouse Electric & Manufacturing Co., 165

Broadway, New York City. Alfred W. Sewell, formerly branch manager at Buffalo, New York, for the Sewell Cushion Wheel Co., Detroit, Michigan, has been appointed manager of the Detroit branch, with headquarters at the factory.

Owen M. Pryor has been appointed distributor of the products of the Sewell Cushion Wheel Co., Detroit, Michigan, for the State of Florida, with headquarters at 1827 Pearl street, Jacksonville.

W. M. Burrell has been appointed efficiency man to study trade conditions and sell merchandise in various sections of the country for the Foster Rubber Co., 105 Federal street, Boston, Massachusetts.

John A. Fowler has been appointed a trade commissioner of the Bureau of Foreign and Domestic Commerce and will visit the Dutch East Indies and British Malaya for the purpose of extending American trade in the Far East.

Prescott C. Ritchie, Western representative of the automobile equipment department of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, has transferred his headquarters from Indianapolis to the Conway Building, Chicago, Illinois.

John B. Livingston, engineer of the storage battery department of the Eagle-Picher Lead Co., New York City, in Cleveland, Ohio, and Miss Irene Arthurs, of Pittsburgh, Pennsylvania, were married in Chicago, Illinois, on November 27, 1918.

L. E. Schumacher, for the last eight years chief inspector of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, has been promoted to the position of works manager of the Krantz Manufacturing Co., one of the company's subsidiaries, at Brooklyn, New York.

William Keane has been promoted from the position of assistant manager to that of manager of the Pittsburgh, Pennsylvania, branch of the Sterling Tire Corp., Rutherford, New Jersey.

C. D. Cortright has been appointed manager of the Rochester, New York, branch of the Sterling Tire Corp., Rutherford, New Jersey. He succeeds William E. Housel who recently was appointed a first lieutenant in the Army.

G. B. Corrigan has been appointed manager of the Boston, Massachusetts, branch of the Sterling Tire Corp., Rutherford, New Jersey, succeeding Elmer Benny who was recently transferred to the Brooklyn, New York, office.

H. J. Smith, an American rubber engineer and general manager of the Neumáticos Nacional Sociedad Anónima (National Pneumatic Co.), Barcelona, Spain, is in the United States for the purpose of purchasing solid-tire and boot-and-shoe equipment.

Frank A. Sharpe has been appointed district manager of the Thermoid Rubber Co., Trenton, New Jersey, in Detroit, Michigan, with offices in the Kresge Building.

M. A. PEARSON JOINS THE ALLEN MACHINE CO.

After January 1, Morris A. Pearson will be associated with the Allen Machine Co., Erie, Pennsylvania, in connection with the design and manufacture of a complete line of machinery for rubber goods manufacturers.

M. A. PEARSON.

Mr. Pearson's experience covers over 20 years, practically all of which has been connected with the rubber trade, where he has many valued friends. He was formerly with the Farrel Foundry & Machine Co., which he served 14 years, resigning his position in 1912 to gain a more practical knowledge of the mechanical needs of the trade, for which purpose he located in the Akron, Ohio, district. Through the offices of a prominent Akron manufacturer, he accepted a position

with the Turner, Vaughn & Taylor Co., the well-known manufacturer of rubber machinery. Within the last six years he has designed the complete mill and calender equipment for over 20 new tire factories, requiring frequent increases of manufacturing facilities. He has contributed articles of interest to THE INDIA RUBBER WORLD, and was recently elected a member of the American Society of Mechanical Engineers.

THE OBITUARY RECORD.

SPENT HIS LIFE IN THE RUBBER BUSINESS.

HERBERT C. SEVERANCE, secretary and general manager of the Racine Rubber Co., Racine, Wisconsin, died of pneumonia, induced by influenza, at his home in that city on November 21.

Mr. Severance was born in Cambridge, Massachusetts, October 28, 1878. He attended the public schools in that city, graduating from the Cambridge Manual Training School in 1897, and entered the employ of the Reading Rubber Tire Co., maker of bicycle tires. The next few years saw him affiliated with other tire concerns, his progress steadily upward. In 1900 he went to the Hartford Rubber Works Co., Hartford, Connecticut, as a salesman, and in this capacity was transferred to Minneapolis, Minnesota, as branch manager. Afterwards he managed the Detroit, Michigan, branch, and when the Hartford company was consolidated in the United States Tire Co., he remained in Detroit as branch manager, and in 1912 became manager of the Chicago branch of the United States Tire Co. In 1913 he resigned this position to become general sales manager of the Racine Rubber Co., and in 1914 was elected secretary, both of which positions he held at the time of his death.

He is survived by his widow, his father and mother, and two sisters. He was affiliated with Masonic bodies in Cambridge, Massachusetts, and Racine, Wisconsin, and was also a member of the B. P. O. Elks. Charitable, yet unostentatious, of a quiet, unassuming, and democratic character, he had many business and personal friends who deeply mourn his loss.

THE BULL'S EYE RUBBER CO.

Extensive alterations and improvements in the Long Island City plant of the Bull's Eye Rubber Co. have been completed and operations will start at full capacity early in January. Vulcanized sheet work, rubberized cloth specialties, unvulcanized tire and tube repair stocks, heels, soles, hat-bags, dash-pots and friction rings are the products. The factory is under supervision of Arthur C. Squires, and Harry W. Doherty has charge of the business management.

THE RUBBER TRADE IN AKRON.

By Our Regular Correspondent.

THE convention of the Ohio Automobile Trades Association opened in Akron on December 5, 1918. About one thousand delegates were in attendance.

Mayor I. S. Myers opened the session and A. O. Wood, president of the Summit County Dealers' Association, also welcomed the visitors. Several addresses and papers by rubber men were features of the program.

W. O. Rutherford, general sales manager of The B. F. Goodrich Co., spoke on "Organization." He declared the war was shortened by the organization of industry and said the War Industries Board was the most powerful commission ever created. He advocated looking beyond the boundaries of this country in the organization of commerce, and expressed the opinion that the country will soon be a power in world trade. He discussed the importance of the motor truck as a means of transportation, and declared the development of a good road system is as important a factor in reconstruction as the railroad was to former eras.

A paper written by H. S. Firestone, president of the Firestone Tire & Rubber Co., was read by C. M. Hamel, his secretary, Mr. Firestone being unable to attend. Rubber, Mr. Firestone maintained, is the most important commodity in the world. In 1917, he said, \$189,000,000 worth of rubber products were manufactured; the figure this year will amount to \$800,000,000. He declared that the rubber industry is bound to grow. Aside from the growing demand in this country, he said, Germany must buy rubber. A section of a tire from a captured German airplane was exhibited, showing it to be made from rubber scrap and rattan.

F. A. Seiberling, president of The Goodyear Tire & Rubber Co., who was to have spoken on the subject "After the War—What?" was unable to reach the city in time. In his place, Harry Quine, advertising manager of the Goodyear company, spoke. He read a telegram from Mr. Seiberling, declaring that Akron is ready for prosperity and that labor and materials alone are needed.

Mr. Quine advocated a Highway Department in the President's Cabinet. He said the road system of the state will be a powerful factor in future transportation because of the growing popularity of the motor truck as a freight and express-hauling medium.

Resolutions were passed advocating the repeal of the Sherman anti-trust law; to indorse the standardization of tires as an economy measure; to indorse all other economy measures advocated during the war by the Council of National Defense; to reinstate in their former positions all returning soldiers; to appeal through the state organization for the elimination or correction of all unscrupulous dealers, and to urge the creation of a highway board whose function shall be to boost good roads.

Confidence in the outlook for a prosperous period of reconstruction, and advocacy of more complete organization of the factors of the automobile trade, seemed to be the key-notes of the convention.

The delegates were taken in trucks to the various rubber factories of Akron and shown through the plants.

The General Tire & Rubber Co., Akron, held its annual sales convention December 4-5, 1918, at which approximately 150 salesmen and distributors from all over the country were present. Intensive sales plans for the coming year were discussed and a comprehensive national advertising campaign laid out.

"The New Opportunity" was the subject of an address by W. C. D'Arcy, president of the Associated Advertising Clubs of the World.

The entertainment included special lunches served at the company's plant, a lake dinner at Young's Hotel, theatre parties and the annual banquet at the Akron City Club.

The company is building a new three-story structure to house its offices, a new power-house, and other additions to its plant.

C. J. Hazen has been placed in charge of advertising and publicity for The General Tire & Rubber Co.

* * *

The B. F. Goodrich Co., Akron, has recommended to its employees a home-purchase plan similar to its group plan of life insurance. Suggestions are being received by The B. F. Goodrich Co. for a memorial to be erected in memory of the 31 Goodrich employees who have been killed or died in service.

James W. O'Meara, of the News Bureau of The B. F.

Goodrich Rubber Co., Akron, has been mustered out of service and returned from Camp Taylor, where he entered the last Officers' Training School.

* * *

The Miller Rubber Co., Akron, has converted \$3,000,000 worth of its authorized first preferred stock into 8 per cent second preferred stock, of which \$2,000,000 has been underwritten. The company has completed all of its building operations.

* * *

The Mason Tire & Rubber Co., Kent, at its annual meeting on November 25, 1918, reelected all of its directors, as follows: O. M. Mason, D. N. Mason, D. M. Mason, M. B. Mason, R. W. MacKinnon, J. H. Diehl, and W. A. Cluff.

The report of the company for the fiscal year ended October 31, 1918, shows gross sales of \$2,324,144.19 in 1918 against \$1,200,000 in 1917; net profit of \$203,406.47 in 1918 against \$104,457 in 1917; and declared dividends of \$132,861.16 in 1918 (including 6 per cent payable on common stock during 1919) against \$48,486 in 1917.

John H. Diehl, general sales manager and one of the directors of The Mason Tire & Rubber Co., Kent, has been elected vice-president, in charge of sales.

* * *

The Firestone Tire & Rubber Co. held its annual meetings of stockholders and directors, including several thousand employees, at the Firestone Club House, Akron, on December 16, 1918. H. S. Firestone, president of the company, presided, and stated that the sales for the year had amounted to \$75,801,506.79 against \$61,587,219.29 during the preceding year, an increase of \$14,214,287.50, or 23.7 per cent. The profits for the year, after allowing for depreciation, losses, taxes, etc., were \$8,320,442.26, which included \$2,610,000 paid in dividends.

During the year the company's plant known as No. 2 was completed and used exclusively for government work, but this work has now been practically completed.

ANNUAL BANQUET OF THE GENERAL TIRE & RUBBER CO.'S SALESMEN.

The addition to the power-house is nearly finished and all machinery is on hand and paid for with the exception of a 25,000-horse-power steam turbine to be delivered in January.

* * *

The Mohawk Rubber Co., Akron, has increased its capital from \$10,000 to \$50,000, to take care of the growth of its business.

* * *

The Wellman-Seaver-Morgan Co., Cleveland, Ohio, known the world over as the manufacturer of general and special machinery, has opened offices at Akron, Ohio, for the convenience of rubber manufacturers. It will manufacture a new line of machinery to include calenders, mills, tubing machines, vulcanizing presses, molds, and cores, with a special type of 200-ton solid-tire applying press.

* * *

The H. J. Adams Co., representing manufacturers and importers of raw materials for the rubber industries, has established itself at 624 Second National Bank Building, Akron, and will carry in its warehouse in the same city stocks of all principal items.

THE GOODYEAR TIRE & RUBBER CO. STATEMENT.

According to the annual report of this company for the fiscal year ended October 31, 1918, the last year's business has been the most successful in volume and profits in the history of the concern. Sales were \$131,247,382 against \$111,450,643 for the preceding year; net profits were \$15,388,190 against \$14,044,216 for the preceding year. During the year dividends were paid on the capital stock as follows: First preferred, 7 per cent, \$1,693,328; second preferred, 8 per cent, \$506,407; common, 12 per cent, \$2,451,816.

The balance sheet as of October 31, 1918, follows:

ASSETS.		
Plant, as per books:		
Real estate and buildings.....	\$15,577,398.80	
Machinery and fixtures.....	14,207,646.81	
		\$29,785,045.61
Patents, trademarks, designs.....		1.00
Securities owned—Book values:		
United States Liberty Loan bonds (all issues).....	1,466,950.00	
Miscellaneous.....	3,896,552.69	
		5,363,502.69
Preferred stock, purchased and held in Treasury:		
1st Preferred (1,475 shares, par value \$147,500).....	135,465.44	
2nd Preferred (145 shares, par value \$14,500).....	14,170.80	
		149,636.24
Notes receivable of officers and employees for capital stock, secured by such stock to the par value of \$1,472,000.00.....		1,112,017.19
Employees' subscriptions for 2d preferred stock (balance unpaid).....		513,633.24
Inventory and current assets:		
Inventories.....	\$30,507,966.81	
Accounts and notes receivable (provision in reserve for doubtful items, \$231,445.30—see Contra).....	13,353,985.00

Surplus, subject to Federal taxes for the year.....	20,717,356.08	
		\$93,619,018.20

All of the officers and directors of the company have been re-elected for the ensuing year.

THE RUBBER TRADE IN BOSTON.

By Our Regular Correspondent.

THE rubber factories in Boston and vicinity have slowed up more or less in the last month of the year. The cancellation of government contracts has been one cause, and another is that many factories choose the last week or two of the year to make changes and repairs, or add new equipment, and to take the annual inventory. The opinion generally expressed is, that while it may take a little time for business to readjust itself from war to peace conditions, the rubber trade promises to be prosperous during the year just opening.

* * *

The Boston Rubber Shoe Co. is enlarging its working force, taking on all its old employees who are returning from service in the Army here or abroad. Having been released from government contracts, the factories are now employed entirely on civilian goods, and are making large tickets every day. Both factories shut down the last two days of December for inventory and repairs, to open promptly January 1 with a full force, and, presumably, business enough ahead to keep that force busy the entire coming season.

* * *

There was held in this city December 30 a general convention of the foremen of the Footwear Division of the United States Rubber Co., calling together the officers of that division of the company's interests, and the superintendents and foremen of the several factories where footwear is made. The convention was held during the day in the auditorium of the City Club, about 500 being present. In the evening a banquet was held at the Hotel Somerset, when an orchestra composed entirely of men from the National India Rubber Co., Providence, furnished the music. The hall was gaily decorated with bunting, the flags of the Allies, and the insignia of the company. Charles B. Seger, the newly elected president of the company; Homer E. Sawyer, vice-president in charge of the Footwear Division, and Myron H. Clark, general factory footwear manager, were among the speakers.

* * *

William J. Gallagher, expert plantation adviser of the United States Rubber Co. and former Director of Agriculture in the Federated Malay States, addressed the Brockton, Massachusetts, Commercial Club Saturday evening, December 14, on "Cultivating Rubber in the Middle East."

* * *

Frederick C. Hood, of the Hood Rubber Co., Watertown, presided at the third annual meeting of the Associated Industries of Massachusetts, held in this city November 26. The following resolution was adopted:

Resolved, That the Associated Industries of Massachusetts, representing more than one thousand industrial concerns in the Commonwealth, believing that those who, in time of public danger, gave up their places to serve the country and who wore its uniform should have the preference in private employment upon

being discharged from public service; and recognizing the obligation of the managers of industry to promote and safeguard the health, comfort and welfare of the workers, pledge this association to use its best endeavors to secure those results.

At the evening meeting, which assumed the character of a Victory Rally, Vice-President Thomas R. Marshall, Major-General Clarence R. Edwards and Howard Cooley, former vice-president of the association, and now vice-president of the Emergency Fleet Corporation, were the principal speakers. Music was furnished by the United States Aviation Band.

At the annual meeting of the Employment Managers' Association of this city, Fred S. Sparrow, formerly with the Hood Rubber Co., Watertown, was elected vice-president. Ralph G. Wells, of the E. I. du Pont de Nemours Powder Co., president of the National Association, was one of the speakers. He outlined the policy and program of the organization to develop and strengthen existing local associations, and to assist in the formation of others. The readjustment of employment methods to meet the coming needs, and the trade tests applied to those called to the colors, were subjects of other addresses.

Mr. Sparrow, mentioned above, for six years employment manager, has severed his connection with the Hood Rubber Co., and is succeeded by Herbert L. Baxter, formerly assistant manager of the cutting room. The employment manager's position with this company is one of unusual importance, as the company hires its workmen not only in the rubber industry, but in many lines of labor in the building trades, doing its own work of this kind instead of having such work done by contract.

The gross sales of the Boston Woven Hose & Rubber Co. in its fiscal year ended September 1 last totaled \$10,200,000, an increase of 30 per cent over the 1916-17 figure of \$7,800,000, and by far the largest twelve months' business in the history of the company. A goodly portion of this business was for government account but, being in the company's regular lines, did not entail rearrangement of plant or equipment to any great extent. The signing of the armistice found the company with no large army orders on hand, however. It still has contracts for furnishing goods to the Navy which will not be cancelled.

The national interest in canning and preserving food during the year stimulated the demand for jar rubbers and this resulted profitably for the Boston Woven Hose & Rubber Co. The sales for the year ending September 1 totaled nearly 4,000,000 gross or nearly 10,000,000 pounds of rubber rings. The company makes public no income account, but from the balance sheet it would appear that net earnings last year approximated \$1,000,000 after depreciation, taxes and other property setups. At the close of business September 1, the company had net quick assets of \$3,175,000, or approximately \$500,000 more than the working capital of the previous year.

It is reported that Albert H. Hadley, of the Chemical Research Co., of Lynn, has discovered and perfected a substitute for rubber cement, the result of fifty years' investigation of cements. His family was among the first people in the country to make rubber cement.

Boston imported crude rubber to the value of \$2,550,124 in the year ended September, 1918, as compared with \$920,040 for the corresponding period in 1917. The exports of manufactured rubber goods for the same periods were \$1,166,482 for 1918 and \$1,212,560 for 1917.

ANNUAL S. A. E. MEETING.

The annual meeting of the Society of Automotive Engineers will be held in the Engineering Societies' Building, West 39th street, New York City, February 4-6, 1919.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

THE year 1918 closes with the several plants constituting the rubber industry of Rhode Island being operated at the same capacity-breaking schedule that has been the record for nearly four years. Although there has been considerable cleaning up on government contracts and sub-contracts within the past month or six weeks, no anxiety has been caused as to the prospects of plenty of work for an indefinite period among the rubber workers, as all the mills are so far behind on regular goods that it will take many months to overtake the normal demands.

The New Year finds a great change in the labor situation that is one of the chief topics of interest among the manufacturers of all lines throughout the State. Up to within a few weeks there has been the same persistent and insistent demand for labor that has prevailed during more than four years. At the present time there appears to be more men seeking positions than there is demand for. The result is that manufacturers, planning for the reconstruction period, are able to be more selective in taking on additional help.

All of the rubber concerns of Rhode Island have materially improved their plants and facilities during the past year, and a number have plans now perfected for a further expansion and improvement. Changing conditions will, it is believed, afford them the desired opportunity of carrying to a successful termination certain plans which, in a number of instances, have been under consideration for a long time. Not only has considerable attention been given to the increasing of the facilities of productiveness in the factories, but the health, welfare and comfort of the employees—individually and collectively—have been looked after in a manner never before equalled in the industrial history of this section.

Plant extensions of the United States Rubber Company furnish convincing proof of the belief of its officials that pneumatics are to be the truck tires of the future, and that the demand for solid tires will be less and less, even for heavy hauling purposes on big trucks. By the end of January, the new tire plant of this company, at Providence, Rhode Island, will probably be completed. It will employ 5,000 men and will be capable of turning out \$20,000,000 worth of solid and large pneumatic tires annually. Further expansion calls for the building of a new cord tire unit in addition to the plants at Providence and Detroit, Michigan, the location of which has not yet been determined.

The plant of the National India Rubber Co. at Bristol is the scene of continual activity because of the improvements that are constantly being made. Not only are there numerous additions, alterations and renovations in progress all the time but many new and novel innovations for the comfort and betterment of the employees are being introduced. Everything possible for the health, safety and general welfare of the operatives is being done by the management, one of the latest acquisitions along this line being the holding of dental clinics, plans for which are now being carefully worked out. The employees are to benefit by the plan, as attention will be given to employees' teeth without delay whenever necessity arises. A dentist will devote regular hours at a room which is now being fitted up for the purpose, and emergency cases will be immediately looked after. Should an employee's teeth require more attention, the patient will visit the dentist at his local office.

The company is also engaged in the preliminary work of organizing a band of 35 pieces, the company to provide the instruments, and the band to be under the direction of a leader who is to arrange for meetings for practice at certain periods each week.

Women employees of the National company have entered into

a series of weekly military drills at the De Wolf Inn. A number of the women who board at the Inn, which is conducted by the corporation, began the drills some time ago and upon their invitation many of the other women are joining their ranks.

Douglas Morey, who has been head of the planning and industrial relations departments of the National company, succeeds H. W. Brown, recently resigned, as head of the employment bureau. The three departments have been consolidated.

Many of the hands released from other manufacturing plants in Bristol recently, owing to the curtailment on orders, are securing employment at the factory of the National India Rubber Co.

The National company closed its entire plant at Bristol on December 27 for the annual taking of stock. The mill, in which 4,500 hands are employed, is scheduled to resume operations on January 3.

The American Electrical Works, manufacturers of insulated wire, etc., at Phillipsdale, in East Providence, are planning a number of improvements in connection with their power distribution service, a contract having already been awarded to construct an intake pipe of reinforced concrete, 300 feet in length and 30 inches in diameter. The engineers in charge of the work have recently completed a study of the company's power plant with a view to offering recommendations as to additional units or changes necessary for increased efficiency. A new centrifugal pump with a capacity of about 1,800 gallons per minute is to be installed and the construction of a pump-house is proposed, the engineers being engaged at present in drawing the plans for this building, which will be of brick, one story, about 20 by 20 feet. Further improvements in the near future are forecasted.

The Woonsocket Rubber Co. has opened its restaurant for employees at its Millville plant and catered to 200 on the first day and over 225 on the next. The restaurant is modernly equipped and the excellent menu is in charge of an experienced chef, assisted by an able corps of attendants. The food is sold practically at cost. In the first of the company's restaurants, which was opened several months ago at the Alice Mill, Woonsocket, more than 300 persons are catered to daily. Hot meals are appreciated at both places.

A permit has been granted by the Inspector of Buildings to the Bourn Rubber Co. for the erection of a one-story brick-and-concrete structure on Warren street, Providence. It will be 90 by 60 feet and is to be used for storage purposes.

An addition is being erected on Hemlock street to the plant of the Revere Rubber Co., that will be one story high, and about 120 by 32 feet. It will be practically of steel construction and is intended for manufacturing purposes.

THE RUBBER TRADE IN TRENTON.

By Our Regular Correspondent.

THE signing of the armistice was quickly followed by orders to cease manufacturing war material. Trenton rubber manufacturers were ordered to continue work on only such goods as were already in process. The Empire Rubber and Tire Co. and the Acme Rubber Manufacturing Co. are completing such orders. The Essex Rubber Co. had a large contract for gas-masks, but the work was quickly stopped. The United & Globe Rubber Manufacturing Co. are working on a large government order for fire hose. This order was not cancelled.

Trenton rubber manufacturers announce that the tire business is not as prosperous as during the summer, and that this is not unusual at this season of the year. They predict a boom in the tire and tube line after the first of January. Meanwhile the plants are kept busy on other lines of work.

The corporate name of the city is to be changed from "The Inhabitants of the City of Trenton" to "City of Trenton."

E. B. Knowles has been appointed general sales manager of the Thermoid Rubber Co., Trenton. He succeeds the late Harold F. Blanchard, whose portrait and obituary notice appeared in THE INDIA RUBBER WORLD for November 1, 1918.

Practically every rubber-manufacturing concern in Trenton has informed the Federal-State-Municipal Employment Agency that it will give the returning soldiers and sailors their former positions. Arrangements have been made to reemploy all of those disabled in service in such a way that by providing mechanical or other aid they can be made self-supporting.

At the annual meeting of the Trenton Rubber Manufacturers' Association, which comprises the Trenton, Wilmington and Philadelphia districts, the following officers were elected: John A. Lambert, president, Acme Rubber Manufacturing Co.; John S. Broughton, vice-president, United & Globe Rubber Manufacturing Co.; Robert J. Stokes, secretary, Thermoid Rubber Co.; Alfred Whitehead, treasurer, Whitehead Brothers. The board of directors decided to contribute \$100 semi-annually towards the support of the Trenton Day Nursery. The association contributes to various other charitable institutions.

William E. Sanders, publicity man for the Essex Rubber Co., recently gave an address on "Rubber" before the Trenton Kiwanis Club.

The Delton Tire & Rubber Co. has nearly completed a two-story all-steel structure 40 by 100 feet to be used as a core room.

The Thermoid Rubber Co. has completed an eighty-foot addition, two stories high, at a cost of \$36,000.

The Joseph Stokes Rubber Co. has installed a modern fire-fighting system providing an ample water supply throughout its plant. The new equipment will reduce insurance rates considerably.

Charles E. Stokes, vice-president of the Home Rubber Co., has been made chairman of the committee to unite all the civic clubs of Trenton having for their object the publicity, progress and prosperity of the city.

The Hamilton Rubber Co. is erecting a one-story manufacturing building to be used as a kiln plant. The structure will be brick, 28 by 41 feet, and will cost \$2,500.

C. Edward Murray, Jr., second vice-president of the Empire Rubber & Tire Co., and Mrs. Murray have returned from White Sulphur Springs, West Virginia.

The employees of the Ajax Rubber Co., Inc., are perfecting plans for the organization of a patriotic and benevolent association.

Edgar H. Wilson, president and general manager of the Dural Rubber Corp., has proposed that a landing field for freight and passenger airplanes be established in Trenton, and has taken up the matter with the Trenton Chamber of Commerce. Mr. Wilson has a wide knowledge of aircraft parts, particularly those made of rubber. He holds twenty-two patents on aircraft parts and has been consulted by representatives of several foreign governments relative to the rubber parts for planes controlled by him and the Dural company, and which have been extensively used by the United States Government. At the Flemington, New Jersey, plant of the company more than 100,000 parts for aircraft have been manufactured.

Among manufacturing concerns in Trenton that have agreed to form War Savings Stamps societies among employees are the following: Ajax Rubber Co., Inc.; United & Globe Rubber Manufacturing Cos.; Home Rubber Co.; Empire Rubber & Tire Co.; Woven Steel Hose & Rubber Co.; Thermoid Rubber Co.; Essex Rubber Co.; and John A. Roebing's Sons Co.

The Federal Tire & Accessory Co., Wrightstown, suffered a fire loss estimated at \$2,500, not covered by insurance, on December 19. The cause was spontaneous combustion.

Charles J. and Aaron A. Moulds, formerly in the employ of the Thermoid Rubber Co. and the Ajax Rubber Co., Inc., respectively, recently spent furloughs with their parents. Both are sailors, the former on the U. S. S. *Rhode Island* and the latter on the U. S. S. *Adams*.

The Epworth League of the Clinton Avenue Methodist Church conducted a rubber social on December 20, the price of admission being a piece of rubber.

CANADIAN NOTES.

The Advisory Council for Scientific Industrial Research has recommended to the Canadian Government to establish at Ottawa a central research institute with the function of a bureau of standards, with a view to establishing standards of measures and materials used in various industries. Manufacturers of rubber goods would benefit equally with other industries by the services of such an institution.

W. Binmore, the retiring treasurer of the Dominion Rubber System, Montreal, Quebec, was given a complimentary dinner at the Ritz-Carlton by his associates prior to his departure for California. R. E. Jamieson, director of sales, presided, and addresses were made by T. A. Rieder, president of the company, and Messrs. Jamieson, Eden, Allan, Thornton, J. M. S. Carroll, and Lieutenant-Colonel Massie. Mr. Binmore was presented with an illuminated address, and with fitted traveling bags for both himself and Mrs. Binmore.

The Oak Tire and Rubber Co., Limited, has removed its head offices from Oakville, Ontario, to 19 Dundas street, East, Toronto, Ontario.

The Hercules Rubber Co., Limited, Brampton, Ontario, is completing its new factory building for the manufacture of all kinds of rubber goods. Machinery, including large horse-power motors, is being purchased and will be installed at an early date. The first line of products will be automobile tires, tubes, and accessories. A. Brown is the secretary and treasurer of the company.

K. & S. Canadian Tire & Rubber Co., Limited, 527 Yonge street, Toronto, Ontario, a recently organized concern whose incorporation was noted in our columns November 1, 1918, will expend \$250,000 in making additions to its plant at Weston. This will cover its requirements in the way of new machinery. Building operations at this point, however, will not commence until early spring.

The Kaufman Rubber Co., Limited, Kitchener, Ontario, won the first honor flag in Kitchener for securing subscriptions to the recent Victory Loan from more than 75 per cent of its employees. The objective was \$26,000 and the amount actually subscribed totaled \$50,300, which was obtained on the second day of the campaign. To this was added \$215,000 subscribed by the company, making the total more than a quarter of a million dollars.

A bequest of \$2,000 has been made to Bishop's College, Lennoxville, Quebec, Canada, in memory of Lieutenant F. Reginald Robinson, who was killed in action on August 19, 1916. He was the son of W. H. Robinson, former president of the Dominion Rubber System.

HUGO WELLEIN.

HARD and conscientious work, beginning at the bottom and going up the ladder round by round, is the record of Hugo Wellein, the recently elected treasurer of the Canadian Consolidated Rubber Co., Limited, Montreal, Quebec, Canada, whose portrait is here presented.

HUGO WELLEIN.

He was born June 21, 1883, at Bridgeport, Ontario, near Kitchener, and began his education in the public schools there. This was followed by three years at Kitchener Collegiate, supplemented by a business course. Starting as office boy with the Berlin (now Kitchener) Rubber Manufacturing Co., where he remained four years, he was appointed accountant to the secretary-treasurer of the Merchants' Rubber Co., Kitchener, in 1904. Six years later he entered the general sales department of the head office of the Canadian Consolidated Rubber Co., Limited, at Montreal. In February, 1913, he became office manager to the manager of the Middle West Division of the company, with headquarters at Winnipeg, Manitoba, and after four years there was appointed manager of the Quebec Division. A year later he became general auditor, and in October was elected to his present position. Thus, for his entire business life of 19 years, he has worked continuously for one concern, for the other companies mentioned all merged to form the present Canadian Consolidated Rubber Co., Limited.

Mr. Wellein is very popular and is held in high regard by all those with whom he is associated in business. He is receiving many congratulations on his recent appointment.

NATIONAL ASSOCIATION OF WASTE MATERIAL DEALERS MEETS.

The quarterly meetings of the National Association of Waste Material Dealers at the Hotel Astor, New York, December 17 and 18, 1918, were well attended. It developed at the meeting of the Scrap Rubber Division, under the chairmanship of David Feinburg, that the Rubber Reclaimers' Division of The Rubber Association now admits that the one-half-cent handling clause of the new scrap rubber packing specifications is undesirable. Freight classification and a possible inspection service for rejected material were discussed. It was also learned that arrangements had been made with the Interstate Commerce Commission to the effect that auto tires may be tied with four ropes, if packages tied with rope and wire are treated alike.

THE CAMERON MACHINE CO., 57 POPLAR STREET, BROOKLYN, New York, has opened a new office in Cincinnati, Ohio, at 503 First National Bank Building. It is fully equipped with samples of the company's line and is intended for a service station as well as a sales office.

"Rubber Machinery," by Henry C. Pearson, is filled with valuable information for rubber manufacturers. Price \$6.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

WRITING, as I do, with the sounds of revelry and bell-ringing in my ears, on an occasion which need not be specifically mentioned, it is not particularly easy to compose one's thoughts to the somber routine of writing on purely trade matters. This, however, is all I am entitled to do in these columns, and the first matter which inevitably comes to mind is the effect that the welcome cessation of hostilities will have on those hives of industry, the rubber works.

That there must be a transition period of general upset goes without saying, but anything like stagnation to follow the cessation of war demands is most unlikely, owing to the deflection of stocks of all sorts of rubber goods in general civilian use. The rubber trade being concerned with equipment, its products will be wanted for some time, as there is no question of an immediate demobilization, though naturally the rush of work to get such orders has subsided and there will be no occasion for overtime. I suppose that manufacturers, especially proofers, would welcome a more sudden change from war to peace conditions, so that they could tackle their civilian trade, as this would be far more profitable than government work, which is now all done on a strictly cost basis and yields only a fair—perhaps some would call it an unfair—profit. No very rapid change could, however, be made all around, as so much of the cloth in stock has been woven and dyed for government purposes, and it would be quite unsuitable for the civilian trade.

THE RAW RUBBER POSITION.

With regard to raw rubber, it is generally thought that there will be no return, for some time at any rate, to the two shillings per pound figure. I gather that the bulk of the stocks held by manufacturers was bought at 2s. 4d. or 2s. 5d. a pound, the demand having been largely satisfied before the fall to 2s. per pound. As a manufacturer said to me: "All of us are not extremely wealthy men, nor do we want to buy for too far ahead, so there was no rush to buy rubber at 2s." Certainly, if there had been, the price would at once have gone up in accordance with customary market procedure. If the rubber-growing interests could have foreseen the present condition of affairs they would not have asked for a government committee, which has got to work just as a general feeling is making itself articulate in the country to get back to self-management.

TESTING RAINFOOF CLOTH.

At the meeting of the Manchester section of the Society of Chemical Industry, on November 8, a paper on this subject was given by Dr. G. Martin and James Wood. Dr. Martin said that the want of a rapid standard method had been felt in recent times when large quantities of material had to be reported upon quickly. He gave a short account of the various methods of rainproofing with aluminum acetate, gelatine, paraffin wax, etc., and emphasized that such goods, unlike rubber goods, are permeable to air, and, except in the case of wax, to a more or less extent to water. They are popular because they were more healthy than rubbered goods and will always be in demand, he thought, for town use, where shelter from heavy rain is always at hand. After describing Gawalowski's waterproof testing apparatus, he then described the War Office drop test, which is a simple form of apparatus and allows results to be obtained rapidly by a process which imitates the natural fall of rain on the cloth. Drops of water are allowed to fall on a piece of the cloth which is laid on blotting paper on a sheet of glass placed at an angle of 45 degrees. The observer watches the glass from behind, and when water is seen on the blotting paper the number of drops of water is noted by the burette,

reading. The results of many tests were given by Dr. Martin, variation as wide as 6 and 18 drops being noted on the same piece of cloth.

In the subsequent discussion it was urged by two or three speakers that to take the mean of such divergent figures as the result of a test was a very unscientific proceeding. Dr. Martin, however, maintained that though the test was not all that it might be, it still gave very useful results, and, at any rate, was much superior to the dash test and the trough test commonly used in the trade. Mr. Terry said that it was obvious that such a test would not be of any service in the case of rubbered goods in which the government relied upon the number of grains of proofing contained on a certain superficial. He also remarked that inequalities of spreading are a common feature in rubbered goods and suggested that Dr. Martin might look into this matter in the case of showerproofings, as it might explain the wide variation in the figures he had given. In the course of his remarks Mr. Terry referred to the humorous skit which appeared in the September number of *THE INDIA RUBBER WORLD*, the recital of the dialogue between the British and American soldier regarding the latter's rainproof causing considerable amusement. Dr. Martin said that so far he had not tackled the question of rubberproofings, but it was his intention to do so.

DETERMINATION OF LAMPBLACK IN RUBBER.

I see that a method for effecting this has been communicated to the Rubber Section of the American Chemical Society by A. M. Smith, of the Bureau of Standards. I have seen only a short abstract of the method, which consists of the removal by solvents and nitric acid of all substances which would change weight on ignition, and estimation of the carbon by the loss on heating. It is stated that the method is found sufficiently accurate for commercial work when a small correction is made to provide for the errors of the determination. I may say that over 20 years ago I worked out a method on very similar lines, though I have never ventured to return my results as more than a fair approximation. A good deal depends upon the nature of the lampblack. I remember saying something about my method to C. O. Weber and he threw cold water on it by saying that lampblack was considerably attacked by strong nitric acid. Presumably it would be mainly the hydrocarbons in the oily blacks that would be attacked rather than the free carbon, of which the American gas blacks are mainly composed. At this juncture, then, if nitric acid is used in the process, it would be more nearly correct to refer to the determination of free carbon than of lampblack in rubber.

A rubber tire with a large amount of gas black is, of course, a simpler problem to tackle than is a common-grade mixing with a few per cent of inferior black, and I have had in my experience rubber samples in which I have found it impossible to obtain a figure in which I had confidence. With a high-grade simple mixing, however, I can quite support the claim that the method as outlined will give most useful results, and especially in cases where the lampblack used is of a standard quality as to specification.

WASTE RUBBER SALVAGE.

A notice recently appeared in the press that by arrangement with the government departments concerned, national collection of waste rubber was to be undertaken with the object of benefiting the funds of the Red Cross. I have not been able to get any details of the project and find that in reclaiming circles it is looked upon as one more of the many brilliant ideas which have been launched during the progress of the war with the same laudable object in view. Certainly one of the difficulties in the

way of waste rubber collection is that the articles are scattered in units all over the country, and of course if delivered by individuals at some central depots it would certainly get over the important item of cost of collection. It is probable, however, now that peace is in sight, that we shall not hear any more of the project.

TIRE SPECIFICATIONS IN AMERICA.

The specifications for pneumatic tires and tubes adopted by the Motor Transport Corps and given in the October number of *THE INDIA RUBBER WORLD* have been read with much interest on this side. The allowance of sulphur being 8 per cent, calculated on the rubber present, is generally considered an improvement on the 5 per cent usually enforced in European specifications for government rubber goods of much the same quality. The lower limit of sulphur, where it is rigidly adhered to, generally means either that an amount of time is necessitated for the cure, which is detrimental to the rubber, or that various accelerators have to be used.

Those manufacturers who saw the specifications for waterproof garments in which oil substitute and reclaimed rubber were allowed up to a certain figure, and who thought that this sort of thing was general, will note that substitutes and reclaimed rubber are barred by the specifications under notice. Reclaimers who were inclined to be jubilant over the waterproof specifications have had their spirits somewhat dampened, as many of them hold that tire covers can contain reclaimed rubber to advantage. This bar to its use certainly cannot fail to harden the hearts of those responsible for specifications in Europe just at a time when signs of yielding to the seductive influence of reclaimers were apparent. No doubt a prominent factor in the prohibition of reclaimed rubber is the impossibility of estimating its amount by analysis, though for the matter of that it is no easier to say whether the "best wild or plantation rubber" has been used throughout.

The clause which states that if mineral matters containing sulphur are used, a sample of the unvulcanized rubber must be submitted for analysis, is presumably connected with the now general use of lithopone, which contains sulphur both as sulphide and sulphate. The clause is one which might be copied elsewhere with advantage as tending to reduce the complications and tediousness of analysis.

FRENCH EXPORT PROHIBITION LIFTED.

The "Journal Officiel," Paris, for October 29, 1918, announces a ministerial decree permitting henceforth the exportation from France, without special authorization, of rubber goods, other than sheets, vulcanized or not, and drainage tubes and gloves for surgical purposes.

BRITISH GOVERNMENT CONTROL OF RUBBER.

In view of the changed conditions, the whole question of government control of the output and selling price of plantation rubber has been reconsidered by the Council of the Rubber Growers' Association (Incorporated), and the following resolutions have been agreed to:

In view of the cessation of hostilities, the gradual introduction thereupon of peace conditions, and in view of the long delay that experience has shown to be inseparable from attempts to put into practical working any scheme of government control, this council instructs its representative on the government committee dealing with the matter to withdraw all proposals for the government control of the rubber-producing industry, but trusts that he will continue to remain a member of the advisory committee and give his valuable help to the industry.

In view of the indication by various bodies in the East of their approval of the control of the rubber output, and of the opinion of this council that control, on a voluntary basis, is most desirable if it can be made effective, the Output Control Committee be requested at once to draw up a scheme and submit it to the Council, when, if approved, an endeavor can be made to obtain sufficient support to it to make it effective.

The representative of the Rubber Growers' Association has placed its views before the Government Committee, and it is understood that no further immediate steps will be taken by that committee in the direction of establishing any government control of the rubber-growing industry.—"Financial Times," London.

THE TIRE TRADE IN JAPAN, CHINA, AND HAWAII.

Clincher tires are most easily obtained in Japan, but straight-side types may be secured through American companies. The one tire factory now established in the Empire is building clincher tires exclusively, but, seeing the probability that in the future straight-side tires will be demanded, has equipment ready to build this style on short notice. Under present conditions, clincher tires assist in selling a car, as most dealers in Japan desire cars fitted with clincher rims and shipped without tires.

The bulk of the replacement business in Japan falls to the Dunlop company, allied with the British company of the same name, working with British and Japanese capital, and maintaining a large factory at Kobe, which makes soft bead tires only, but produces many other kinds of rubber goods. Its business extends throughout the Far East and as far south as Singapore, and it does an immensely larger trade in jinrikisha tires than in auto tires, as there are only five or six thousand autos in all China and Japan, while there are hundreds of thousands of jinrikishas, practically all of which are provided with pneumatic tires.

Black tops for autos meet the demand in Japan, although an option of either black or khaki is appreciated. The climate generally does not go to extremes of hot or cold, so the materials used in standard production in the United States will meet every requirement.

Although the first autos appeared in China in 1901, there are less than 3,000 in the whole Republic to-day, the reason being the impossible roads. At the present time most of the auto tires used in China are standard American makes, but several of the leading European tire makers were represented in China before the war, and will doubtless go after the business again when conditions become normal. Tire prices in China are high as compared with those in America, being affected by freight, duty and exchange.

In the Hawaiian Islands there are more autos than in Japan and China combined, and sales are increasing rapidly on account of the phenomenal prosperity the Islands have been enjoying for several years past. The market for tires is identical with that in the United States for an equal number of cars, say about 6,000. ("Motor Vehicles in Japan, China and Hawaii." Special Agent Series No. 170. United States Department of Commerce.)

A ROYAL RUBBER OFFICE IN HOLLAND.

The Minister of Agriculture, Industry and Commerce has established a Royal rubber office, which is located at 100 Zeestraat, The Hague. G. I. de Vries, former chief of the rubber department of the Netherlands Overseas Trust Co., is the director of the new office. The activities of the Royal office for bicycle tires have been transferred to the new office; the former tire office goes out of existence. L. C. Steffelaar, director of the former tire office has been honorably discharged. The advisory committee of the former tire office will henceforth act in connection with the Royal rubber office.

NATIONALIZATION OF THE RUSSIAN RUBBER INDUSTRY.

The whole of the rubber manufacturing industry in Russia has now been nationalized and is controlled by a body styled the Administrative Department of State Rubber Works, under a decree issued by the Russian National Economic Council, says the "India Rubber Journal," which adds that no private trade connections abroad are to be permitted, and that all such contracts already made are cancelled.

Spanish Market for Rubber Goods.

Special Correspondence.

SPAIN to-day looms up to the American rubber manufacturers as virgin ground for the sale of their products. Before the war 90 per cent of the rubber goods used in Spain were furnished by the Continental-Caoutchouc & Gutta Percha Co., Hanover, Germany; the Prowodnik Rubber Co., Riga, Russia; Michelin & Co., Clermont-Ferrand, France; Pirelli & Co., Milan, Italy, and the Dunlop Rubber Co., Limited, Birmingham, England, and it is safe to say that of the above companies the Continental-Caoutchouc & Gutta Percha Co. of Germany furnished the largest percentage of goods.

Now it will be some time before Germany will be a strong competitor in the manufacture of rubber goods, since nearly all her rubber factories have been stripped and dismantled for war purposes, and, moreover, Germany has practically no crude rubber on hand. During the war she paid unheard-of prices for contraband rubber, which was smuggled into the country by her submarines, and now that the war is over the crude rubber needs of the other countries will be first considered in order to replenish their home requirements for rubber goods. The United States should avail herself at once of the opportunity to put not only rubber but every product into Spain by means of able representatives and good management.

Spain to-day is practically clean of rubber goods and only those of inferior make are obtainable and then at very high prices. The classes of rubber goods most needed at the present time are pneumatic and solid tires, druggists' sundries, hose, packing and a full line of footwear, as well as soles and heels.

There is no doubt that American goods if properly pushed will forge ahead, and Spain will become one of our largest rubber goods consumers, and the same can be said of all South American countries that were formerly supplied for the greater part by Europe.

It should be understood that, although Germany has sent no rubber goods into Spain since the war started, she kept her organizations in Spain at work compiling statistics on the rubber trade, and the Germans know the situation better to-day than we do ourselves. One good point to consider is that some of our products would have to be changed to a certain degree, such, for example, as solid tires, as the road conditions of Spain are very bad and the foreign rubber companies' engineers have made a study of these and supply a solid tire to meet the unusual conditions.

Although there is at the present time a large factory being installed in Spain, practically all of the crude materials must be obtained from abroad and it will be some time before the Spanish labor will become proficient enough to compete with our skilled workmen, therefore "Made in the United States" on any product in Spain to-day is a decided advantage.

In this connection it is interesting to note that the Neumáticos Nacional Sociedad Anónima (National Pneumatic Co.), Bar-

celona, Spain, will add a full line of solid-tire and boot and shoe equipment to that already installed. Although this company was financed entirely by Spanish capital, the factory is supplied throughout with American equipment, installed according to American practice, therefore the products will be like those made in the United States.

The entire installation and construction of the factory were achieved with Spanish labor that had never seen rubber machinery, and while the Spanish laborers are not as expert as Americans they are steady and willing. Great hardships were encountered in procuring pipe, pipe fittings, valves and all such material, as Spain imports all supplies of this nature from other countries and on account of the war it was almost impossible to obtain the necessary supplies to work with. For instance, two-inch pressure pipe was selling for \$5 a yard and all valves had to be cast and made specially to order,

costing five times what they would cost in normal times.

French rubber experts who have visited the factory and examined all the American equipment very closely, say it is one of the best-equipped and most up-to-date rubber factories in Europe.

This will be the first rubber mill in Spain to manufacture all kinds of rubber goods, there being at this time only a few very small factories making specialties.

The factory is 1,000 by 500 feet, built on the one-story plan, and so constructed that additional

units can be added whenever needed. It is situated on the Cardona river, 50 miles north of Barcelona, so that water power will be used to generate the electricity necessary in operating the plant.

THE FAR EASTERN RUBBER CRISIS.

THE rubber situation in the Straits Settlements and Federated Malay States, together with the report of the recently appointed rubber commission, as published in the "Straits Budget," is briefly as follows:

For a while restriction of output had been considered, but then came the recognition of the fact that such restriction without accompanying increase of price would render the producer's position worse, not better. So thought was given to the rate of depletion of pre-restriction stocks and the balance between restricted production and restricted consumption.

PRICE CONTROL.

The commission considers that as artificial restriction of rubber consumption is being met by artificial restriction of production, there must be price control, three courses seeming to be open. The first is control of price by prohibiting export of rubber sold at less than a minimum price, the second is an imperial monopoly in rubber under the control of a rubber trust, the third is control of price by government buying at a minimum price.

CARDONA RIVER DAM UNDER CONSTRUCTION.

IMPERIAL MONOPOLY.

It is doubted whether the first course would afford the assistance that appears to be required, but the commission strongly recommends the second course, imperial monopoly with a rubber trust, to the consideration of the British Government. Each British rubber-producing country would enter the trust to the extent of its restricted output. Holland could be allowed to join the trust. Each country would buy its entire output. The rubber thus bought might be dealt with on joint account, or on separate account, as might be most convenient. The trust would fix the buying and selling prices from time to time and arrange on a pro-rata basis of the output for the allocation of the orders.

If the output of the Federated Malay States was reduced to, say, 46,000 tons a year, and if the buying price was £260 a ton (equivalent to 2s. 4d. a pound), a capital of £11,196,000 would buy up the whole year's output. But such an amount would not be necessary, for the stock would be turned over.

GOVERNMENT CONTROL.

If it is decided not to form an imperial rubber trust, the commission holds that the government (the imperial or local) should be willing to adopt the third course, and buy rubber of a specified grade at a specified price, to be modified from time to time, in accordance with varying factors, when there are no other buyers at that price.

RUBBER GROWERS' ASSOCIATION SUGGESTS MINIMUM PRICES.

The Rubber Growers' Association suggests the following present minimum prices per pound, ex-warehouses, in the Eastern markets at port of shipment: first crêpe, fair average quality, 2s. 3½d.; ribbed, smoked sheet, fair average quality, 2s. 3d.; first crêpe, off quality, 2s. 3d.; ribbed, smoked sheet, off quality, 2s. 2d.; clean, light brown scrap crêpe, 2s. 1½d.; clean, medium brown scrap crêpe, 2s. 0½d.; speckly, medium brown scrap crêpe, 1s. 11½d.; dark to black scrap crêpe, free from heat, 1s. 10½d.

COST OF PRODUCTION.

The cost of production is shown in the following statement, sent in to the commission from 193 estates, which have been divided into classes "A" and "B" estates, whose f. o. b. cost of production does not exceed 45 cents per pound in class "A," other estates in class "B." The monetary figures are in Straits Settlements currency, one dollar being equal to 56.7 cents United States currency.

SUMMARY OF ESTATES' COST OF PRODUCTION FIGURES FOR THE HALF-YEAR—JANUARY 1 TO JUNE 30, 1918.

Class.	Acres Rubber in Bearing.	Crop Secured to End June (6 Months).	Average Yield per Acre per Annum.	A. General Cents.	B. Rubber Cents.	C. Up-Keep of Bearing Area.	D. Tapping and Curing.	E. Packing and Despatch.	F. Export Duty and War Tax.	G. F. O. B. Cost if Yield Restricted to 200 Lbs. per Acre.	H. F. O. B. Cost if Yield Free.	I. Percentage increase in F. O. B. Cost.
"A" Class, 107 estates...	110,578½	16,838,783½	304	14.98	6.77	14.31	2.25	2.21	35.31	45.06	27.67	
"B" Class, 86 estates...	74,802¾	9,370,128½	250	16.68	13.59	21.26	2.30	2.33	58.83	61.40	14.06	
193 estates	185,381½	26,208,912	283	14.07	9.81	17.41	2.27	2.27	43.56	54.00	22.92	

Note.—Export duty and war tax have not been included in the f. o. b. cost, either unrestricted (G) or restricted (H).

The f. o. b. cost is reckoned without export duty, war tax, local freight, insurance, Singapore selling charges, depreciation, head office charges or directors' fees. The lowest f. o. b. cost, thus reckoned is 20.4 cents, and the highest, 78.29 cents. The cost for one estate is below 25 cents a pound; for 33 estates, over 25 cents and under 35 cents; for 73 estates, over 35 cents and under 45 cents; for 48 estates, over 45 cents and under 55 cents; for 24 estates, over 55 cents and under 65 cents; for 11 estates, over 65 cents and under 75 cents; for three estates, over 75 cents.

SUMMARY OF REPORT.

The following is a summary of report of Rubber Industry Production Commission:

1. Existing stocks plantation rubber in United States of America, United Kingdom, British Malaya, and Netherlands East Indies estimated at 148,620 tons.

Returns of stocks in Continental Europe, Japan, Canada; Australia, Ceylon not available.

2. Production of 1917 was 200,000 tons. Even if output of 1918 and 1919 does not exceed this, it amounts to 400,000 tons for those two years.

Estimated consumption plantation, 1918, 150,000 tons; 1919, 117,000 tons.

Apart from existing stocks, therefore, production of 1918 and 1919 will meet consumption of 1918, 1919 and 1920 without touching 1920 crop.

3. Restriction of output plantation rubber therefore necessary as soon as possible, as temporary measure during present period artificially reduced consumption.

4. It is recommended that British and Dutch governments agree to restrict by law their output for a period to be determined later by mutual agreement. Output of Indo-China practically negligible.

5. Flat rate of 50 pounds an acre of tappable rubber for first period of three months is recommended, being at rate of 200 pounds per annum. It may be necessary to reduce this later.

6. System of licenses for estates and coupons for small holdings elaborated in detail and recommended.

7. Recommended that imperial trust be formed by governments of British and Dutch rubber-producing countries, with monopoly of buying and selling for period mutually agreed upon. In respect of rubber produced during restriction of output, price to be paid for first latex sheet or pale crêpe (f. a. q.) one dollar, Straits Settlements currency per pound, ex-warehouse Singapore.

8. If trust not approved, there should be a minimum price, and government of each country should buy output if market price does not exceed minimum price.

9. Minimum price 80 cents Straits Settlements currency recommended for qualities above mentioned.

10. For lower qualities valuations would be made by Standard Qualities Committee to be appointed for that purpose in Singapore.

11. Control should be in hands of Rubber Controller, with residence in Singapore. He should be assisted by advisory committee. There should be under him deputy rubber controllers in Malaya, Ceylon and India, with local advisory committees.

There should be independent rubber controller in Netherlands East Indies, working in conjunction with him. Any order varying rate of restriction of output or buying price if there is a trust, or minimum price, would be made by British and Dutch controllers in agreement.

12. All rubber-consuming countries should be asked to pass their orders to rubber controller for allocation or else allocate the orders themselves and report particulars thereof to Rubber Controller.

13. Actual buying, selling and storing rubber can be carried out

by firms now engaged in trade under supervision of deputy rubber controllers.

14. Whether there is trust or minimum price, it is recommended that government should offer to purchase at equitable price stocks of good-quality rubber produced before restriction and Malay States. Quantity of good-quality rubber in Straits Settlements and Malay States estimated at about 25,000 tons.

In conclusion our contemporary points out that, although the war is ended, for a time there will be an increased, not a decreased, demand for shipping on the Atlantic, since America will have to repatriate millions of men as well as to send urgently needed food to Europe. If one reason for the restriction of rubber imports was to force shipping from the Pacific to the Atlantic, it may be quite sure that the need of it there will be as great in 1920 as it is at present, so that the rubber industry has to prepare for a period during which the conditions to be faced will be altogether abnormal.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED OCTOBER 15, 1918.

- N**O. 1,281,141. Demountable wheel rim. Z. C. Angevine, Long Beach, Calif.
- 1,281,273. Rubber tread for boots and shoes. E. Bernstein, Chelsea, Mass.
- 1,281,364. Airless tire with rubber core. H. S. Hawks, Kansas City, Mo.
- 1,281,469. Tire-tube-repairing kit. G. B. Wood, Detroit, Mich.
- 1,281,476. Rubber tread for boots and shoes. G. M. Anderson, Wash. and D. C.
- 1,281,526. Calipers for pneumatic tires. H. E. Curtis, Dayton, O., assignor to The B. F. Goodrich Co., New York City.
- 1,281,554. Balloon window. I. R. Gammeter, Akron, O., assignor to The B. F. Goodrich Co., New York City.
- 1,281,557. Hose. H. W. Goodall, Alden, Pa.
- 1,281,558. Armored pneumatic tire. W. O. Gottwald, Washington, D. C.
- 1,281,601. Reinforcement of tire bases. G. H. Lewis, assignor to The Fisk Rubber Co., both of Chicopee Falls, Mass.
- 1,281,890. Demountable wheel. I. M. Algire, Riverside, Calif.
- 1,281,893. Rubber wheel-solvent shoe for pneumatic tires. L. E. Bacon, Estelene, Colo.
- 1,281,937. Ether-mask. E. Gamble, Waverly, N. Y.
- 1,281,975. Improvements in life-saving garment. R. J. Kee, Toronto, Ont., Canada.
- 1,281,979. Vehicle wheel with pneumatic tire on felloe. W. P. Keogh, Brooklyn, N. Y.
- 1,282,000. Intravenous-injection apparatus. J. H. Quayle, Cleveland, O.

ISSUED OCTOBER 22, 1918.

- 1,282,182. Anti-skid chain for twin tires. L. Brook, Brighouse, Eng.
- 1,282,197. Tubeless tire, rim and lock therefor. F. B. Cumpston, Blooming Grove, Tex.
- 1,282,258. Rubber-shoe last having wooden core with metallic surface. M. M. Merritt, Danvers, assignor to Copper Products Co., Boston—both in Mass.
- 1,282,260. Rubber-shoe last with metallic reinforcing strip at top and electrolytically deposited hollow shell, etc. M. M. Merritt, Danvers, assignor to Copper Products Co., Boston—both in Mass.
- 1,282,274. Rubber heel construction for boots or shoes. N. H. Morozowicz, Bellevue Borough, and J. R. A. Farr, Ben Avon Borough—both in Pa.
- 1,282,350. Anti-slipping device combined with rubber heel. H. H. Wood, Oyster Bay, N. Y.
- 1,282,362. Rim-demounting wheel for motor vehicles. E. K. Baker, assignor to Baker Wheel & Rim Co.—both of Chicago, Ill.
- 1,282,397. Stiffened-rubber shoe-sole. H. C. Egerton, Passaic, N. J.
- 1,282,398. Rubber shoe-sole with interlocking stiffener. H. C. Egerton, Ridgewood, N. J.
- 1,282,399. Stiffener for rubber shoe-sole. H. C. Egerton, Ridgewood, N. J.
- 1,282,400. Interchangeable reinforced rubber shoe-sole. H. C. Egerton, Ridgewood, N. J.
- 1,282,427. Resilient wheel-tire. F. I. Johnson, assignor to Johnson Pneumatic Tire Co.—both of Fitchburg, Mass.
- 1,282,428. Resilient tire for vehicles. F. I. Johnson, assignor to Johnson Pneumatic Tire Co.—both of Fitchburg, Mass.
- 1,282,441. Corset with elastic straps. J. Leopold and M. Beberfeld, New York City.
- 1,282,457. Two-part wheel rim for tires. B. J. Oltmanns, Peoria, Ill.
- 1,282,468. Device for maintaining a tight in flexible electrical connections. G. L. Scheel, Chicago, Ill.
- 1,285,511. Ink-tablet holder for fountain pens. J. Williams, Abergelle, and L. T. Jones, Old Colwyn—both in Wales.
- 1,282,527. Life preserver. G. Bondule, New York City.
- 1,282,569. Truss. A. T. Gookin, Cambridge, Mass.
- 1,282,584. Elastic attachment for shoes to prevent wear on hosiery. M. W. Hunter, Washington, D. C.
- 1,282,586. Belt of leather and elastic webbing cemented together. J. Jacobs, assignor to The First Leather Belt Co.—both of New York City. (Original application divided.)
- 1,282,611. Cushion wheel. J. W. Martin, Pittsburgh, Pa.
- 1,282,651. Waterproof-fabric tire protector. W. L. Stuyversson, St. Louis, Mich.
- 1,282,690. Inner tube for tires. J. H. Hamlin, Winston-Salem, N. C.
- 1,282,692. Resilient tire. A. G. Hoegren, Chicago, Ill.
- ISSUED OCTOBER 29, 1918.
- 1,282,930. Pneumatic mattress. N. M. Takach, Bridgeville, N. Y.
- 1,283,033. Solid elastic tire. J. M. Avery, Dallas, Tex.
- 1,283,046. Resilient tire. J. W. and G. F. Burgess, Kansas City, Mo.
- 1,283,065. Inner tire-cushion. J. W. and G. F. Burgess, Kansas City, Mo.
- 1,283,095. Toy balloon. F. A. Cumiskey, St. Louis, Mo.
- 1,283,260. Thermostat. H. D. Montgomery, Brooklyn, N. Y.

 23,757. The word SHELLBAC and the representation of a turtle—rain-boots. Hubert Douglas Groves, 15 Station Road, Huddersfield, Yorkshire, England.
 23,774. The letters B. B. C.—billiard and pocket-billiard balls. The Brunswick-Blake-Collender Co., Chicago, Ill., U. S. A.
 23,811. The words KOR-KER—puncture sealing compositions for pneumatic tires. Puncture Cure Sales Co., Newark, N. J., U. S. A.
 23,866. Representation of the head and shoulders of a gladiator with Roman helmet—rubber belting, hose, packings, mechanical rubber goods, automobile and motorcycle tires and accessories, bicycle tires or rubber bicycle materials, and rubber boots and shoes. Gutta Percha & Rubber, Limited, Toronto, Ont.

NEW ZEALAND. TO AMERICANS.

- 14,714. Representation of a kneeling monkey chopping off end of tail on jar labeled MOCO MONKEY GRIP, beside the name of the concern and beneath the words: "It's a long tale, but I'll cut it short. Moco Monkey Grip is the best!"—self-vulcanizing cold patch of rubber for automobile and motorcycle inner and outer tubes and gaskets. Moco Laboratories, Inc., 9 South Dewey street, Oklahoma City, Okla., U. S. A. (A. C. Wilshire, 219 Clarence street, Sydney.)
 14,715. Representation of two monkeys swinging from the first and last letters of the word MOCO above them, with the words MONKEY GRIP beneath. Same as No. 14,714.

THE FRENCH REPUBLIC. TO AMERICANS.

- 25,650. The word RALSTON pierced from left to right by an arrow—shoes of leather, fabric, cloth, and rubber. Churchill & Alden Co., Brockton, Mass., U. S. A.
 25,658. Representation of a tire through which is thrust an arm and hand wearing a rubber glove, the hand holding a surgeon's knife—rubber heels, soles, and tires. The Miller Rubber Co., Akron, O.
 25,659. Representation of conventionalized Brownie-type mermaid figure in color, with the words BETTY WALES—rubbers, shoes, waterproofs, etc. Goldman Costume Co., 16 West 33d street, New York City, U. S. A.
 25,687. The word RINEX—soles of rubber, fiber, or other materials for boots, shoes, and the like. United States Rubber Co., 1790 Broadway, New York City, U. S. A.
 25,688. The word SPRING-STEP—rubber heels for boots and shoes. Revere Rubber Co., 335 Valley street, Providence, R. I., U. S. A.

TO CANADIANS.

- 25,637. Representation of seal of Dominion Rubber Co., Limited—goods made wholly or partly of rubber or of rubber combined or mixed with other materials, such as rubber shoes, tires, tubes, waterproof fabrics, gloves, belts, balls, balloons, druggists' sundries, mechanical goods, etc. Dominion Rubber Co., Limited, Montreal, Que., Canada.
 25,638. Same as No. 25,637.
 25,639. Representation of an anchor and the words ANCHOR RUBBER CO. within a circle of rope—rubber goods same as No. 25,637. Canadian Consolidated Rubber Co., Limited, Montreal, Que., Canada.
 25,640. The words FLEET FOOT—rubber goods same as No. 25,637. Canadian Consolidated Rubber Co., Limited, Montreal, Que., Canada.
 25,641. Representation of a flying eagle with the words GOODYEAR'S RUBBERS above and below, respectively—rubber goods same as No. 25,637. Canadian Consolidated Rubber Co., Limited, Montreal, Que., Canada.
 25,642. Representation of seal of Canadian Rubber Co. of Montreal over the words TRADE MARK and JACQUES CARTIER—rubber goods same as No. 25,637. Canadian Rubber Co. of Montreal, Limited, Montreal, Que., Canada.
 25,643. Representation of a maple leaf bearing the words THE MAPLE LEAF BRAND—rubber goods same as No. 25,637. The Maple Leaf Rubber Co., Limited, Port Dalhousie, Ont., Canada.
 25,644. Representation of crossed snow-shoes with superimposed shield bearing the words GRANBY RUBBER CO., LIMITED—rubber goods same as No. 25,637. Granby Rubber Co., Limited, Granby, Que., Canada.
 25,645. Representation of head of moose over the words THE MERCHANTS RUBBER CO., LIMITED—rubber goods same as No. 25,637. The Merchants Rubber Co., Limited, Kitchener, Ont., Canada.

CEYLON RUBBER EXPORT TAX REDUCED.

Ceylon companies have for some time past been taxed to the amount of 7½ rupee cents per pound of rubber. Following the change of policy in Malaya, the Ceylon Government has now decided to reduce this tax to one of three rupee cents per pound. The old tax meant 1¼d. per pound, and the concession is a welcome one, particularly in connection with the elimination of the war risk insurance on cargoes.

THE RECONSTRUCTION CONFERENCE.

THE Reconstruction Conference of the Industrial War Service Committee called by the Chamber of Commerce of the United States, held at Atlantic City, New Jersey, the first week in December, brought delegates from nearly 400 industries to consider the present industrial situation, and readjustment upon a peace basis. Between 3,000 and 4,000 business men were present to take part in the deliberations.

The business of the convention was greatly facilitated by dividing the various industries into 35 related groups and afterward assembling these into ten major groups, combining and representing the ten leading industries.

SUBJECTS PRESENTED AND RESOLUTIONS PASSED.

The scope of the convention, which lasted four days, can best be appreciated by the subjects of the resolutions presented by the clearance committee and unanimously adopted at the closing session. These included: the cancellation of war contracts, distribution of surplus government supplies, removal of restrictions on industry, development of pivotal industries, industrial cooperation, filling of vacancies on Federal Trade Commission, industrial relations, relocation of labor, development of public work, readjustment of taxation, provision for shrinkage of values in inventories, return to owners of railroads, against government ownership of telegraphs, telephones and cables, the construction of a great merchant marine, development of port facilities, investigation of public utilities, development of hydro-electric power on waterways, common service of ocean tonnage to secure to all nations their immediate needs for food, raw materials and transportation of their products, appointment of a commission to visit Europe to study reconstruction needs, and to be available to the peace delegates of the United States for any needed information relative to the industries, government encouragement of the development of foreign trade, closer relations with South American countries, protection of property rights of Americans in Mexico, provision of educational facilities to prepare young men for foreign commerce, maintenance of forest products laboratories, uniform system of cost accounting, council and trade committees to coordinate with the various war service committees, organization of a representative association in each industry, to be a member of the National Trade Association.

GROUP 20—THE RUBBER INDUSTRY.

The rubber industry was assigned to Group 20, which included also saturated and coated textiles and allied products. It held two meetings, both of which were presided over by Frank A. Seiberling, president of the Goodyear Tire and Rubber Co., Akron, Ohio. Representing the industry were the following:

Bruce Bedford, Luzerne Rubber Co., Trenton, New Jersey;
E. B. Brinkerhoff and T. B. Coughlin, British-American Manufacturing Co., New York City;
J. W. Curtis, A. G. Spaulding & Bros., New York City;
H. W. Dunn, The Fisk Rubber Co., Canton, Massachusetts;
S. H. Dodd, Vulcanized Rubber Co., New York City;
Harvey S. Firestone, Firestone Tire & Rubber Co., Akron, Ohio;
George E. Hall and J. W. Fellows, Boston Woven Hose & Rubber Co., Cambridge, Massachusetts;
G. B. Glazener, American Hard Rubber Co., New York City;
G. M. L. Hemmaway, secretary War Service Committee of the Rubber Industry;
J. W. Maguire, Brunswick-Balke-Collender Co., New York City;
J. W. Seiberling and D. R. Stevens, The Goodyear Tire & Rubber Co., Akron, Ohio;
R. H. Sotherland, Mansfield Tire & Rubber Co., Mansfield, Ohio;
F. E. Titus, The E. F. Goodrich Co., New York City;
H. Weida, India Rubber Co., New Brunswick, New Jersey, and
W. M. Milner, secretary.

THE MEETING OF GROUP 20.

Mr. Seiberling in his address commented upon several subjects which were to be considered at the conference, most of which are included in the above list of resolutions.

J. W. Curtis, of A. G. Spaulding & Bros., addressed the meeting on the injustice of taxing rubber-soled tennis shoes, golf balls and other sporting goods at higher rates than articles of luxury.

Alvan Hunsicker, vice-president of the Standard Oil Co.,

New York City, called attention to many points which were later made subjects of the general resolutions. On some of these general discussion followed.

W. H. Maass of the War Service Committee made a brief address, and after the appointment of a committee on resolutions the meeting adjourned.

RESOLUTIONS OF THE RUBBER AND ALLIED INDUSTRIES GROUP.

At the second meeting of Group 20 the committee on resolutions presented the following:

NO. 1.—COMMITTEE OF BUSINESS MEN TO EUROPE.

WHEREAS, The deliberations of the Peace Conference may develop questions which will involve the welfare of American industries, and

WHEREAS, There is apparently no provision made by the Government to have present in Europe a delegation of representative American business men, therefore be it

RESOLVED, That it is the sense of this meeting that a delegation of representative American business men be sent to Europe to volunteer their assistance to the United States Peace Commission.

NO. 2.—FINANCING FOREIGN SALES.

WHEREAS, It is apparent that in exploiting export-business it is necessary to provide for an advance system of financial credits, therefore be it

RESOLVED, That the proper agencies of the Government be urged to investigate the fiscal methods practiced by the Governments of other nations with which American industries must compete, and that there be established facilities for meeting competitive business in foreign markets on an equal footing.

NO. 3.—TAXATION.

WHEREAS, The scheme of taxation in the revenue law about to be enacted contemplated a very extraordinary and possible increasing expense for an indefinite period on the part of the Government, and

WHEREAS, Under continued war conditions it would have been wise to have raised a large sum by direct taxation, and

WHEREAS, On account of the close of the war the amount needed by the Government will be much less than contemplated, and

WHEREAS, The amount that will be needed can approximately be determined, therefore be it

RESOLVED, That any scheme of taxation should embody provisions for the distribution of the amount necessary for governmental current requirements over a sufficient length of time to avoid an undue assessment on business at this time and that the present excise tax operative under clause 600 of the existing law as well as the proposed excise tax operative under clause 900 of the proposed bill be eliminated and that the burden of taxation in so far as the income tax feature is concerned be more widely extended on a basis that will be fair and equitable to all.

NO. 4.—MINIMUM AND MAXIMUM PRICES.

WHEREAS, The Government in order to help win the war was compelled as war measure in the face of a rapidly advancing market, to fix a maximum price on certain raw materials and finished products, and

WHEREAS, Upon the signing of the armistice the large governmental demand was removed, thereby creating a condition that threatens abrupt liquidation with a possible drastic decline in values, therefore be it

RESOLVED, That we urge upon the proper governmental agencies the establishment of a fixed minimum price on such materials on which a maximum price has been fixed and that these fixed prices be revised periodically until such time as values are reached more nearly on a pre-war basis.

NO. 5.—GOVERNMENT MATERIALS ON HAND.

WHEREAS, The sudden release of materials now held by the Government purchased for war purposes beyond the military requirements for the immediate future would seriously dislocate many lines of business by forcing upon the market a volume of materials and supplies far beyond the needs of the consuming public during the readjustment period, therefore be it

RESOLVED, That it is the sense of this meeting that the Government hold these materials in storage for a sufficient length of time to permit those industries which were engaged in the manufacture of war munitions to readjust their business and return nearly to a pre-war basis, and the use of these materials and supplies made in installments covering a reasonable period of time so as not to disturb the stability of the market and that these materials and supplies when offered for sale should first be offered to the export trade of the country which furnished them, and that any surplus not taken in this manner be disposed of through the recognized distributors of such materials and supplies and not by public auction or other dumping methods.

NO. 6.—HIGHWAYS.

Highway improvement is of such vital importance to the welfare of the nation that we urge the immediate creation of a separate and distinct Federal Highways Commission whose duty it shall be to construct and maintain a system of National Highways and that appropriations be made therefor.

NO. 7.—CRUDE RUBBER.

WHEREAS, The rubber industry is among the largest industries of the United States, and

WHEREAS, This industry is entirely dependent upon foreign markets for its supply of crude rubber and accordingly its expansion and its possibility of competing in the export trade of the world is entirely at the mercy of the economic policy of these foreign governments, be it

RESOLVED, That we urge that no export tax be placed against crude rubber discriminating against the United States which it would possibly cripple the rubber manufacturing industry and wholly exclude the United States from competing in the export trade of the world. Be it also further

RESOLVED, That some guarantee shall be given by all foreign governments owning or controlling the supply of crude rubber, that manufacturers of rubber goods in the United States shall be able to obtain their supplies of crude rubber upon as favorable terms as the manufacturers of all other countries.

Similarly enough, when these resolutions came up in Major Group No. 5, Resolution No. 7, relating to crude rubber, was tabled, the others passing, with slight modifications.

Review of the Crude Rubber Market.

NEW YORK.

QUIETNESS characterized the market for the first half of the month, although there was a fair demand from manufacturers. Spot offerings were light, and the market tone was firm. At the middle of the month the announcement was made that all restrictions upon the quantities of crude rubber that may be imported from overseas were at an end and that import licenses would henceforth be granted regardless of quantities involved. It was also learned that the government option prices were withdrawn and that no undertaking as to maximum values would be required in the future.

Consumers have shown little interest in the situation, buying only small quantities. During the second half of the month there was very little stock of any kind on the spot, and, in fact, no island coarse, caucho ball or cametá at all. Manufacturers will hardly be in the market for appreciable quantities for the next two weeks at least.

The report that the Netherlands East Indies Government had placed an embargo on rubber and jelutong exports from the Dutch East Indies was without foundation, but the exports have been placed under government control.

On December 20, restrictions as to the quantity of balata, gutta percha, gutta siak, and jelutong for shipment from overseas were removed. Official option prices were withdrawn and from now on no undertaking as to maximum prices will be needed. The only restrictions abolished are those affecting shipments from primary or overseas markets. Applicants for import licenses will, however, still have to conform to the other existing import regulations.

PLANTATIONS.—On December 1, latex was 63 cents and ribs were 61½ cents. Quotations, for arrival, were, on December 26, 1918: latex, 54 cents; ribs 52½; January-February shipments, latex, 52 cents; ribs 51 cents.

PARÁS.—On December 26, prices were: upriver fine 61 cents (a month ago 66 to 68 cents); upriver coarse, 35½ cents (a month ago 38 to 40 cents); upper caucho ball, 35 cents (a month ago 38 to 40 cents); cametá, 24 cents (a month ago 26 to 28 cents).

NEW YORK SPOT QUOTATIONS.

**Nominal.

RECLAIMED RUBBER.

There was a little activity noticed in the reclaimed-rubber market during the first part of the month, but the volume of business was small. Following the armistice and the subsequent removal of restrictions on crude and manufactured rubber, there was even less interest shown in reclaims and the market became very quiet. This condition is apparent at the present time in all markets for rubber supplies, but the expectation of activity early in the year is confident in many quarters. The prices on standard reclaims has not changed materially since last month.

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report (November 7, 1918): The weekly rubber auction which commenced yesterday, saw a further substantial advance in the prices of all grades. In the earlier part of the sale spirited competition rushed the price for smoked sheet up to 67 1/2 cents, and closed at 70 1/2 cents. Clean brown and good dark crepes were in good demand and show an advance averaging 4/5 cents. Of 1,142 tons cataloged, only 395 tons changed hands, but this small sale is due so much to a poor demand as to reluctance on the part of sellers to meet the variations of an erratic market.

The following was the course of values:

	In Singapore per Pound.	Sterling Equivalent per Pound in London.
Sheet, fine ribbed smoked	65c @ 67 1/2	1/11 1/16 @ 2/ 0 5/16
Sheet, good ribbed smoked	52 @ 64 1/2	1/11 1/16 @ 1/11 1/16
Sheet, plain smoked	55 @ 64 1/2	1/ 8 1/2 @ 1/ 8 1/2
Sheet, plain	50 @ 57 1/2	1/ 7 3/4 @ 1/ 9 1/4
Crepe, fine pale	49 @ 57 1/2	1/11 1/16 @ 2/ 0 5/16
Crepe, good pale	49 @ 64 1/2	1/ 6 1/4 @ 1/11 1/16
Crepe, fine brown	39 1/2 @ 47	1/ 4 1/8 @ 1/ 6 1/4
Crepe, good brown	30 1/2 @ 39	1/ 1 3/4 @ 1/ 4
Crepe, dark	27 @ 33 1/2	1/ 3/8 @ 1/ 2 1/2
Crepe, hark	19 @ 28 1/4	1/10 1/4 @ 1/ 1
Scrap, virgin and pressed	19 @ 20	1/10 1/8 @ 1/10 1/8
Scrap, loose	18 @ 24	1/10 @ 1/11 1/16

THE MARKET FOR RUBBER SCRAP.
NEW YORK.

THE upward tendency has been notwithstanding the last few weeks, scrap dealers may have cause for thankfulness, if not for jubilation. There is great satisfaction over the fact that the Government no longer places any restrictions on the use of rubber by manufacturers. While, of course, crude-rubber men also have reason to be glad for that, the value of reclaimed rubber is so well established that scrap dealers expect both better prices and more business within the next few weeks.

BOOTS AND SHOES. A very quiet market at 8½ cents to 9 cents, delivered mill.

INNER TUBES.—Scarcely any movement at all, but quotations on all grades one-quarter or one-half cent higher.

MECHANICALS.—Transactions purely nominal.

TIRES.—Sales small and hard to make, prices unchanged.

NEW YORK QUOTATIONS FOR CARLOAD LOTS DELIVERED.

DECEMBER 26, 1918.

Prices subject to change without notice.

THE MARKET FOR COTTON AND OTHER FABRICS.
NEW YORK.

THE total production of cotton in the United States for 1918-1919 is now estimated by the Department of Agriculture at 5,595,329,000 pounds—linters not included—equivalent to 11,700,000 bales. In 1917, 11,302,375 bales had been produced, and in 1916, 11,449,930 bales. This year's production thus exceeds last year's by 398,000 bales. The maximum prices and restrictions on cotton fabrics and manufacture enforced by the price-fixing committee of the War Industries Board end January 1, 1919, when the Board itself goes out of existence. No part of the stocks of cotton goods purchased by the Government will be sold in the open market, which would disturb the cotton goods market. The greater part of the stocks will be used for European relief, and some will be sold back to the manufacturers.

Since December 20, 1918, the following commodities are no longer on the export conservation list: Egyptian cotton, airplane cotton duck, cotton liners, rubberized silk suitable for use in the manufacture of aircraft and silk schappe.

EGYPTIAN COTTON.—The War Trade Board announces that the regulations on the importation of Egyptian cotton issued in W. T. B. R. 144, June 30, 1918, are revoked. Beginning January 1, 1919, licenses will be granted to import not to exceed 40,000 bales of Egyptian cotton, quality or grade unlimited. The War Trade Board will control the distribution in this country of the quantities imported through the Textile Alliance, Inc.

SEA ISLAND COTTON.—Net receipts at Savannah this season are 4,775 bales, against 19,859 last year. Interior points report an increase of business with prices a cent or two higher. Gin-

ning will be over by January 1. Quotations are omitted owing to the irregularity of asking prices.

DUCKS, DRILLS AND OSNABURGS.—The price of hose and belting duck remains firm, owing to the strength of the raw cotton market and the demand for duck, which is particularly active among the automobile trade. Quotations for the other fabrics have moved up and down, and are fairly described to-day as "same as last." Market stronger. Demand improving.

RAINFOAT FABRICS.—No business at all being done at the present time, but activity expected for the new year. Prices have been declining.

TIRE FABRICS.—Demand is slow, nothing unusual for the holiday season, but indications are for increasing activity.

NEW YORK QUOTATIONS.

DECEMBER 26, 1918.

Prices subject to change without notice.

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK.

THE base metal market is dead. Present conditions are so hard to analyze that neither producers nor consumers care to do anything but await the outcome of the course of events. It is understood that, after January 1, government control of all commodities save tin will come to an end. There are no inquiries for copper. Tin, contrary to expectation, is no longer subject to international control, but will be regulated in the United States until the stocks of the Steel Products Co. have been utilized. Meanwhile there is no demand. There is no interest in lead. Few purchasers of spelter. Antimony is falling.

CARBON TETRACHLORIDE.—Sales of this material have been made at 18 cents a pound by second hands. The undertone is weak.

DRY COLORS.—As soon as production costs can be reduced, it is expected that prices will fall. The market is quiet now, but producers are beginning to pay considerable more attention to the export trade than they did in the past. Iron blues have been selling as low as \$1.10. Prices are firm.

LITHARGE.—Little demand for this pigment. American powdered, in casks, sells at from 103½ cents to 11¼ cents. Quotations vary according to quantities asked for.

LITHOPHANE.—A cut in price of ¼-cent a pound has been announced for the next three months. Quotations now are 79½ cents for carload lots and 84½ cents for less than carload lots. More interest is being shown.

SULPHURIC ACID.—Although the producers had asked the government to continue price-fixing for some months, control ceased December 31. But the producers are closing contracts for future delivery at the old W. T. B. prices, \$28 for oleum, \$25 for 66-degree and \$18 for 60-degree.

TALK.—The situation remains unchanged. Shipping is the decisive factor in imports as well as exports.

WHITING.—In spite of the cancellation of government orders the supply is none too great, so prices are not undergoing change.

ZINC OXIDE.—The producers have announced new prices for the next three months which are ¼-cent lower on American process oxide and one cent lower on French process oxide. It is thought imports will soon come in again. Some dealers are beginning to sell at a fraction less than prices quoted.

NEW YORK QUOTATIONS.

A CORRECTION.

Mrs. Bertha M. Lufbery has been appointed executrix of the estate of the late George F. Lufbery, Jr., at Elizabeth, New Jersey. Contrary to the statement which appeared in our issue of December 1, 1918, Mr. Lufbery's rubber substitute business has not been taken over by W. J. Moren.

Vol. 59.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank draft, Post Office or Express money order on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.

AS TO MACHINE-GROWN RUBBER.

GREAT INTEREST has developed of late in American-grown rubber. This has chiefly centered about guayule, although other shrubs and plants that contain caoutchouc, and grow in the temperate zone, are receiving attention. Of them all so far, guayule cultivation is the only one the success of which seems assured. A spectacular feature concerning it is the profit per acre that analysis of the project develops.

For example, a comparison of *Hevea* and guayule profits at the time of the historic rubber craze would be about as follows: *Hevea* then brought \$2 a pound and the profit was about \$400 per acre, while guayule sold at \$1 a pound and if cultivated would show a profit of more than \$16,000 per acre. Or basing the comparison on normal costs and prices, *Hevea* profits would stand at, say, \$136 an acre, and cultivated guayule at over \$6,000 per acre.

These figures, to be sure, do not include the cost of installing the plantation plant, extraction plant, patent royalties, etc. But cutting them in half to cover these items, there remains a profit of \$3,000 an acre, which is astounding and almost unbelievable.

There is, however, an important fact to be kept before those who plan to start in this line. It is a far more intricate business than *Hevea*-growing and lack of knowledge in a dozen different essentials will spell disaster. There is also the high cost of installation of the plantation and the extraction factory. To prepare, irrigate and plant enough land to keep a 10-ton mill going would cost roughly \$500,000, and the mill at least \$200,000. In other words, it is a million-dollar undertaking and the small operator has no great chance. With the expansion of business, however, it is perfectly possible that central factories will be installed for extraction and that guayule-growers will ship their product in as the beet-growers do theirs to the sugar centrals.

As to the grade of rubber produced, plant analysis has found certain types of shrub that carry a high grade of rubber, and these have been hybridized with plants that contain percentages of 20 per cent or more of rubber. A better grade of gum than the Mexican product is therefore in prospect in the cultivated guayule rubber, some day to figure largely in our markets.

INCREASE IN RUBBER GOODS EXPORTS.

THE American rubber manufacturer is so accustomed to big things that he remains unimpressed by present accomplishments that formerly would attract admiring attention. A case in point is the great expansion in the export of rubber goods. To cite a few figures, in 1913-14 mechanical rubber goods exports totalled \$2,372,887. In 1917-18 they expanded to \$4,578,396. Rubber footwear in the same periods were \$1,113,844 and expanded to \$5,774,341. Tires grew from \$4,108,294 to \$15,108,294. Even druggists' sundries increased from \$200,000 to \$884,245.

These are great increases. Part of them, as boots and tires, are directly due to the unusual demands of the war, but only in part. The burning question is, whether or not we can duplicate or perhaps surpass these records.

THE OLD MAN MAKES GOOD.

PRIOR to our entrance into the Great War, the United States was a young man's country. Manufacturers, big and little, were disciples of Dr. Osler to an extreme degree. A man over thirty-five was viewed with suspicion. The general belief was that at thirty-six he began to "go stale." Gray hair was not a "crown of glory" but a certificate of dismissal. When, however, the youngsters joyously gave up their positions to smite the Hun, the older men took their places. Not only did they take them, they filled them, and so well did they prove their value that the age limit has passed into the discard. The general feeling is that older men, even if

slower (sometimes they are faster), make fewer mistakes and in the end accomplish just as much as the kids. The older man possesses experience, judgment and balance, the younger man energy, optimism and enthusiasm. All of these attributes have great industrial value.

RUBBER FACTORY FIRES.

ARE rubber factories specially hazardous insurance risks? Surely they are subject to the general run of fire causes in manufacturing establishments, and besides these, a special risk in the use of volatile solvents which throw off inflammable vapors. Indeed, a noted authority, after investigation of a large number of fires occurring in rubber mills, claims that over 70 per cent of those where the sources were discovered, were from the accidental ignition of these liquids, or the vapors arising from them.

The most common cause is the combination of vapor from these solvents, and an electric spark, in a dry atmosphere. The greater proportion of them are at the spreading machines, where friction produces static electricity, which, being discharged, explodes the vapor and starts the resultant fire.

Cases are on record where the machine-tenders are themselves the generators of static electricity, which, emanating from them, induces the explosion. While accidents from this cause are far from common, several fires have been laid to this peculiar phenomenon.

Many fires are the result of carelessness on the part of workmen, whose very familiarity with these dangers has resulted in almost criminal heedlessness. Smoking in vapor-laden rooms, or where finely divided inflammable dust floats in the atmosphere, the striking of matches, the carrying of lighted lanterns, are known causes of rubber-mill fires. Safety first means humidifying rooms where vapors form, thorough electrical grounding of machines, and the prohibition of carelessness on the part of workmen.

COPYRIGHTING INDIA RUBBER.

ACERTAIN SHOCK is experienced by English-speaking rubber men because of the action of the India Rubber, Gutta Percha and Telegraph Works Co., Limited, in copyrighting the words "india rubber" in Argentina. The Silvertown company, one of the largest in England, has always been regarded as not only very progressive but eminently fair. Its action has therefore caused much comment and considerable indignation. Guessing at its reasons it may be that as it started the first rubber factory in Argentina it felt that the trade of that country belonged to it though preemption. Or it may be that the big sign fronting its works in Buenos Aires which bears the words "India Rubber" (rather remarkable in a Spanish-speaking country) led it to feel that it had a proprietary right in the words as far as Argentina was concerned. A more reasonable surmise,

however, is that in the face of increasing competition it put a local attorney at work securing Argentine copyrights on all of its trade-names, and he supposed india rubber to be one of them. At all events it is not likely that the copyright will stand nor is it supposable that the Silvertown company would desire it to.

HOMER E. SAWYER AS PRESIDENT.

WITH the New Year comes a new president of The Rubber Association, one widely known and universally esteemed. Mr. Sawyer served his apprenticeship in New England at the great factories of the Boston Rubber Shoe Co. When that company merged with the United States Rubber Co., he was a vital factor in both the selling organization and the manufacturing field, in both of which he was thoroughly at home. In spite of many responsibilities Mr. Sawyer, from the beginning, has always been active in The Rubber Association. His familiarity with its history and development, his broad knowledge of the whole rubber business, his wide acquaintance, together with his genial efficiency, make him an ideal leader.

AN IMPORTANT BRITISH MANUFACTURER OF TIRE-repair machinery, in protest against the word vulcanizer as applied to the man who operates such a machine, has coined a new word. Henceforth the vulcanizer, the man, is to be a "vulcanist." We are not sure that this is wise. If such word-vaccination becomes the fashion, the rubber trade may see instead of washer, washist; mixer, mixist; calender man, calendist; boiler man, Bolshevist.

Why not abandon the ists and turn to the eers? Thus an engine-driver is an engineer. Why not make a vulcanizer operator a vulcaneer? The term is new, easy to remember, essentially masculine, and even romantic.

INDUSTRIAL ASSOCIATIONS IN FRANCE ARE DEMANDING that a committee of technicians be appointed in each industry and sent to indicate on the spot such industrial material as may replace plants destroyed or looted in the regions invaded by the German authorities.

This practical suggestion is important, for it would enable French industrialists, by receiving in kind at least, the equivalent of destroyed or looted plants, to get to work more rapidly and to meet the competition prepared in advance by the enemy.

This is exactly what this paper has been suggesting editorially ever since the armistice was signed. It is the only open road to reparation.

THIRTY MILLION PNEUMATIC TIRES FOR 1919 IS THE confident prediction of the big tire makers. This is very many and means much rubber. It is, however, a sane prophecy. And, once northern Europe is pacified, other millions will be called for. Indeed, once the League of Nations is an accomplished fact, and peace really comes, rubber producers and tire manufacturers, the world over, will have all they can do to fill orders.

Victory Banquet.

Nineteenth Anniversary Banquet of The Rubber Association of America, Inc.

SURPASSING any previous function in colorful setting, exquisite menu, pertinent addresses and delightful entertainment, the banquet at the Waldorf-Astoria on the evening of January 16, 1919, was indeed a triumph. Preceding the dinner the members and guests assembled in the reception rooms with social informality, meeting old acquaintances and making new ones. When the doors of the ballroom were opened eight hundred fifty banqueters took their places while the orchestra played popular marches. A handsome program and a small silk American flag were presented to each member and guest.

American flags in artistic profusion decorated the walls and balconies of the ballroom, symbolizing the Army, while the columns were draped with American jacks, emblems of the Navy. Prominently displayed over the rostrum was a diadem of flags of the Allies with Old Glory in the center, and below, a silk banner bearing the great seal of the United States, flanked by the coats of arms of the United States, the State, and the city of New York.

During the dinner patriotic and popular music by the orchestra gave zest to the excellent menu, and when the last course was finished the toastmaster, Bertram G. Work, called the meeting to order. By this time the balconies were filled with ladies who had been invited to enjoy the speeches and vaudeville entertainment that concluded the program.

After "The Star-Spangled Banner" had been sung in chorus, the toastmaster announced that he had the unexpected pleasure of introducing a man of national reputation who had just arrived from abroad and would say a few words. He proved to be a vaudeville performer with a startling resemblance to President Wilson, and his witty monolog caused much laughter and left the audience in rare good humor. The cabaret vaudeville that followed the speeches was thoroughly enjoyed by everyone.

PRESIDENT WORK'S REPORT.

I will take a few moments for a few words. With a preamble of a year ago I had no nerve and I had a pretty good voice. This year I have got the nerve, but I have lost my voice.

The activities of our Association during the past year have been vital and continuous. They have made history for the industry, and are written into the annals of the Association. You are all familiar with the details of the year's work, so a review of them this evening is unnecessary. The actual work of your War Service Committee ceased shortly after the signing of the armistice, and this afternoon the committee was officially discharged by your board of directors. In behalf of this ex-War Service Committee, I wish to express the warmest thanks and appreciation for the loyal support of the industry which, as is generally known, was given at no inconsiderable sacrifice. I also wish to express my personal appreciation and thanks to all members of the War Service Committee for their loyal support and cooperation. This committee held 57 meetings during the year, and it is a magnificent tribute to the industry that a body of men composed of highly competitive elements at no time allowed their individual interests to interfere with the one object for which they were responsible to our country and to the industry. Great credit is due to the chairmen and members of the divisional committees. These men spent nights in travel and days in conference, time after time during the year. They unselfishly contributed to the cause, and were actuated only by the thought that our industry must do its part in winning the war.

The work of the Central Committee was tense, but only for the duration of the war, while the work of the Divisional Committees will live after them, having been transfused into permanent bodies representative of each branch of the industry.

WAR INDUSTRIES BOARD APPRECIATES LOYALTY OF THE RUBBER INDUSTRY.

We hoped to have with us to-night some other members of the War Industries Board, but other engagements made it impossible. Mr. Baruch writes under date of December 18th:

WAR INDUSTRIES BOARD, WASHINGTON, D. C.

My dear Mr. Work:

I am deeply appreciative of the honor you do me in inviting me to be the guest of The Rubber Association on January 16th. I should like to be able to take that opportunity to express in person my appreciation of the loyal cooperation the rubber industry has given the War Industries Board throughout its period of service, but it is impossible for me to make any definite engagements in the near future. With very kind regards,

Very truly yours,
BERNARD M. BARUCH. Chairman.

As we all know, he is now in Paris. We have with us to-night Mr. Baruch's right-hand man, Mr. Peek, but Mr. Peek came on the condition that he would not be asked to speak. So I cannot break the agreement with him.

Judge Edwin B. Parker writes from Houston, Texas, under date of January 3d:

WAR INDUSTRIES BOARD, WASHINGTON, D. C.

Dear Mr. Work:

I have delayed until now definitely replying to your very thoughtful invitation of the 16th to attend the Victory Banquet of The Rubber Association to take place in New York on the 16th instant. I very much fear my engagements here are such that it will not be possible for me to accept your invitation; but if permissible to do so, I will not definitely decline now. If I find that I can be in New York on that date, you may be sure that I will not permit anything to prevent being with you. I beg to repeat now what I have had occasion to say before, that you and your Committee represented not only your industry, but our Nation, in dealing with the rubber situation during the war, and there was no industry from which our Board received more wholehearted and effective cooperation than yours. Our association will always bring to me pleasant memories.

Cordially yours,
EDWIN B. PARKER,
Priorities Commissioner.

Gentlemen, it is also a matter of great regret that Mr. H. T. Dunn, former chief of the rubber section, cannot be with us to-night. He is still suffering from an attack of grippe contracted while in Washington, and aggravated by continuing his work with the War Industries Board when he should have been in bed. We all owe a debt of gratitude to Mr. Dunn for the able and unselfish manner in which he represented our industry in Washington.

CONSERVATION AND STANDARDIZATION TO CONTINUE.

The work of conservation, elimination and standardization will be perpetuated by the various divisions of the association. Some were already organized, and others have been organized to take up this work in all matters of divisional interest. The functions heretofore exercised by the Conservation Division of the War Industries Board are to be continued by the Department of Commerce under its industrial cooperative service. While the work of the new service will be voluntary so far as the industries are concerned, our work in this direction can be materially aided and broadened by cooperating with the Department of Commerce.

Secretary Redfield is our honored guest this evening, and has very kindly agreed to outline to us in a general way the proposed work of his department in connection with industries. I take great pleasure in introducing the Secretary of Commerce, William C. Redfield.

SECRETARY REDFIELD'S ADDRESS.

Mr. Toastmaster, Ladies and Gentlemen:

We have had two very wonderful examples for all the world to see in these recent months; one of them an example of horrible selfishness. We saw a great and intelligent people, more devoted to science and research than all other nations, given over to the powers of evil and devoting itself to the exploiting of the world for its own glory and profit.

I went, two or three years ago—no, it was more than that; it seems so near—it was seven years ago, I went down the coast of China, looking for an American business house, and found

The Victory Banquet.

NINETEENTH ANNUAL BANQUET OF THE RUBBER ASSOCIATION OF AMERICA, INC., AT THE WATFORD-ASTORIA, JANUARY 10, 1916.

not one all the way from Tokio until I got to Singapore. At Hong Kong, I found a Scotchman who had lived in New York. That was the nearest approach to an American house on all the Chinese coasts. But everywhere, in every port, under the splendid hospitality of the English rule, the German was prospering; and in Hong Kong harbor I lay immediately alongside of the German armored cruiser *Sharnhorst*, now gone to a well-earned grave at the mouth of English cannon.

THE SELFISHNESS OF GERMANY.

We saw Germany build up her industries that she might make the world tributary to Germany; for German gain, for German profit, that you and I and all men might so far as possible contribute to the power and the domination of Germany. In the first week of the war our minister at The Hague telegraphed to the President, "Germany means to breakfast in Paris, lunch in London, and dine and spend the night in New York." And you are perfectly familiar with the fact that the Kaiser said long years ago that on the opposite side of the Atlantic without Germany and the German kaiser no one would dare make any high decision. We saw the awful tragedy that ended that dream of selfishness. I trust we have learned the awful lesson that history has again reiterated, this time in our midst. One after another the men and the people that would have ruled the world for their profit have come, have passed their little time upon the stage and gone.

THE SACRIFICES OF UNSELFISHNESS.

And we saw here the other thing. I saw it every day these two years past—a vision of great unselfishness, of men having come, forgetting themselves and all the things that men count precious, leaving at home business and personal profit of every kind, and for a trivial compensation or none at all, coming to the seat of government and working without regard to hours or strain in order that their country might defeat that power which sought its overthrow. Be not deceived, my friends. We are escaped as a bird out of the snare of the fowler. He sought what you and I hold dear. It is by the foregoing sacrifice of American men that our daughters have not suffered as did those of northern France, that we face readjustment and not reconstruction. Were you an audience of French or Belgian business men where would you go in northern France or Belgium to find your homes? It would seem strange to you to have nowhere to sleep, to find your business stripped and gone, to go back perhaps to your native town unable to find the site where once your dwelling was. That is reconstruction indeed. Beside this your problems and mine are trivial and they are based all through on the willing sacrifice of American business men who have done more in one year to make their government know that the heart of American commerce was true than could have been accomplished in years of talking and pleading.

THE INDUSTRIAL POWER OF AMERICA.

For we have seen you in our very midst at work, and we have seen the power of this nation gathered through you into a force that overwhelmed the enemy. A year ago or more a minister of a neutral power was about to leave his post in Washington, and came to bid me farewell, for I knew him as a friend. I knew he was going where he had a German colleague, and I sent a message by him to his German colleague, not formally so, but saying to him something which I knew he would repeat, and it was this:

That he would see a spectacle such as the world had not before witnessed of the unrolling of American industrial power, and that he might watch for it; that it would not be rapid, but it would be as certain as fate, and that whatever we might do with army or navy this one thing was sure—that the industrial power of America would present to the world one of its most majestic spectacles, as it was soon to be placed, all of it, freely at the disposal of the nation as one tremendous power for righteousness in war.

And we saw that power so exerted. I wish it had been possible for you—I wish it had been possible for me—to have seen the physical work that the Army did in France. I knew a little bit of what was going on. Once in a while I caught a vision of things so vast that they staggered me, who have spent my life in American industry.

One evening we were considering the question of fire insurance on the factories which were at that time busy backing up the Army, and it was far from being advanced then to what

it afterwards became, and it was brought out in the evening's talk that we should have to look after fire insurance upon 35,000 separate factories working at that time to support the American Army. The spectacle some day will be written, and will be, as I said to my friend, the minister, majestic, but the finest thing of it all was the human side that forgot itself and faced the selfishness of Germany with the unselfishness of America.

OUR DUTY TO SUCCOR RUSSIA.

And now we look still to the unselfishness of America, for we face great things yet to be done. The military operations, let us hope, are past. Let us hope are past! But you and I sit as we are in a great theater before a curtain that has not yet lifted, behind which lies, unknown as yet, the dreadful problem that Russia presents to the world. We have seen, thank God, within a week, something that looks like the restoration of sanity in Germany itself, but what the stage may hold behind the Russian veil, we do not certainly know, for there are 180,000,000 human souls there of whom 160,000,000 cannot read or write; they cannot be reached by press or by book or by pamphlet, and what we are there to find, we do not yet fully know. We may not, you and I, we may not, like a turtle, draw our hands, our feet and head into our shell and say, "We will have none of this." We may not, like the ostrich, bury our head in the sand and say, "We see nothing."

Your boys and my boy fought the fight against the autocracy of imperialism. Let us hope and pray we may not have to face the autocracy of anarchy. We believe that Bolshevism rests on hunger, and we have abundance to spare, thank God, and we must give of that abundance. We sent last year twice the food we ever thought we could spare. We must send at least one-half as much more food this year.

We have it to send, but if you trouble, as some of you may, on the question of shipping, gentlemen, remember that over twenty million tons of food must go yonder from this country alone before the spring is half gone, lest starvation, which means anarchy, walk abroad. It is walking abroad now. We are through with military operations. We are not through yet with the problems. There is the question, then, which I have thus raised, of ships; and now I speak to you as practical men and manufacturers in the language which you know so well.

SHIPPING BOARD TO ESTABLISH COMPETITIVE RATES.

We have not yet a plant, a physical plant, afloat in this country to do the work that we are called upon to do. Let us not be too impatient with those who control our shipping. Bear in mind, as I shall tell you in a moment, that I am doing myself, in every possible word and influence, all that can be done to bring sufficient shipping to the immediate relief of the commerce that waits in all our ports; and to-night, thank God for it, it is announced that the Shipping Board has seen the need of standing the gaff, as you have to stand it, and of reducing its valuations on this vast multitude of shipping, so that the rates it is hereafter to charge shall be fairly competitive rates, and your commerce shall be free to move on equal terms with all the world.

There have been days, there have been recent days, in which it was deemed possible that an effort might be made to charge American industry with rates at sea so as to earn a profit upon the war cost of American ships. That danger is past. Perhaps the earthquake reported a few days ago was, after all, merely the reaction of certain telegrams passing under the sea.

None the less, the thing is over; the danger is past, and we are free to move at sea once more when once we can get the ships to go. Out of twenty-one vessels to be built this month on the Pacific Coast alone, I have succeeded in getting six for our trans-Pacific trade; for the others are needed for food for the world, and for the transportation of necessary army supplies.

THE UNITED STATES A WORLD CREDITOR.

I should like, if time permitted, to develop still further the great business problems we are now facing, the problem of credits. You know very well, and I, that we must face six billion dollars in taxes this year; that above it we must face a loan of five billion dollars in the month of April, and that on top of that we must continue our credits to those yonder who have no credits themselves, and who needs must buy and have not that wherewith to pay. Would you leave the people of Serbia without homes? They have been driven from their land—all the families, men and women and children, all that

WILLIAM C. REDFIELD.
SECRETARY OF COMMERCE.

survived—and come back to find their country stripped. Would we supply to Belgium homes? Would we supply to Northern France homes? It is probable a million dwellings must be built in Continental Europe alone this coming spring and summer. From somewhere they must get cement and lumber and hardware, and none has so much of all to spare as we. But how shall they be paid for save by credits which we shall ourselves extend in addition to what we have already done? And you must be prepared, you men of affairs, to be asked and to consent to the purchase of strange and novel securities in your home towns; for unless America shall buy the securities of foreign corporations, industrial, municipal and others, it seems that it would be very difficult indeed to build up the world again to anything like its former status.

The war is over, say you? No, no. The explosion of the cannon has stopped, but the stern service of war is here yet; and in food and credit and in materials and in machinery, it must still go on.

EARLY REMOVAL OF CABLE CENSORSHIP AND TRADE RESTRICTION.

That leads to another thought, which I am sure you have all been thinking. What about cables? What about censorship? What about restrictions that still exist on trade? First of all, then, it is my desire, it is all the thought of Washington, to get rid as rapidly as may be of every restriction on every trade of every kind. But there are certain things in which we are not free to move alone. By the very terms of the armistice, the blockade remains, and that blockade we are not free to move to lift by ourselves, for we are bound with others to act in good faith with them. A part of that blockade is the cable censorship, and it is not in the power of the United States alone to act upon that matter. We must act concurrently with those with whom we have agreed to act. Nevertheless, I have within a few days cabled to Secretary Lansing in Paris, saying to him that it is my earnest hope that he may get concurrent action of our associates in the war, and release the cables and the censorship freely for America.

PROMOTION OF UNITED STATES FOREIGN COMMERCE.

I want to speak, for my time is properly limited, very briefly, of the future work we are planning to do. It takes three forms. It takes the direct form of promotion of the commerce by which the country lives. We have within this week been given by Congress double the sum that we have ever had before.

I do not speak a word of criticism at all when I say that on going to Washington six years ago I found the sum annually appropriated for the promotion of American commerce abroad the vast annual figure of \$60,000. I presented to Congress the statement that many an advertising firm even in my home Borough of Brooklyn spent more than that in selling dry goods to the women of the town. I pleaded only a few weeks ago at least a sum equal to the payment of the soldiers of one regiment be given to develop American commerce abroad. We asked three times what we had. It had grown from the \$60,000; it had grown more than ten times. We asked three times what we had and we got twice, and we are glad to have it; and now with the funds given by the President himself that our commerce may have eyes and ears abroad, the men are going on until we have already covered most of the world and we hope to cover it fully with trained business men of affairs, speaking the languages of the countries to which they go, always, and trained in your factories and others to do the work of American industry throughout the world until we think we shall be able by the summer-time, for the appropriation does not take effect until the 1st of July, to put abroad in all the round globe, bright, earnest, capable young American business men, eagerly carrying the flag into every land on which the sun shines.

GERMAN SCIENTIFIC TRADE METHODS.

Secondly, we aim to bring to you something you have never had, and not having had have hardly missed, for Germany built her industries on science, gentlemen. Her great success all around the globe was based on actual knowledge. It did not raise a laugh in any German factory to mention the name of a strange country. It has often made me feel queer to speak of some foreign city of importance in an American shop and have the men laugh as if the very name itself had something funny about it.

I remember discussing once the great Dutch East Indian Port of Soerabaya to an American audience, only to discover shortly thereafter that very few of them had ever heard of a port in which hundreds of vessels lie all the time.

Germany built her business on scientific work, and in her business houses of large size were men who spoke all her

civilized languages and some besides; and she knew with perfect certainty what she was to do. Let me give you a trifling example. In a certain Central American country is an Indian tribe that buys large quantities of cotton. America failed to sell them. So did Great Britain. So did Germany. But the Germans went back and sent from the textile mill to a university for an ethnologist. What has an ethnologist to do with trade? They put to him this question: "Have these people certain sacred symbols and lucky designs? Have they sacred colors and unlucky ones?" He told them. The German salesman went back and presented to the tribe textiles woven in designs that were familiarly sacred to them and in colors that were consonant with their ideas of good fortune; and he sold them and nobody else ever did. It is common sense, isn't it? Would you send a salesman to Southern Ireland to sell orange-colored goods? Would you send a salesman to Asiatic Turkey to sell textiles with the design of the Sign of the Cross? And yet, we do not think, you and I, we do not think of these things.

EXACT KNOWLEDGE A TRADE NECESSITY.

It is only a month since a great American concern was about to send a color card to China, offering for sale to those Chinese merchants, whose ability to buy and sell those of you who deal in Singapore know perfectly well, offering to send to that class of Chinese trade color cards in which the blue was the coolie blue of China.

When will we learn to apply exact knowledge to our business life? That knowledge in science as well as in research abroad we are able to bring to you; and if there be in your establishment a problem in your own business which you have neither time nor ability, having to earn your living, to work out, we are ready to put a staff of rubber experts, scientific men, trained in our own rubber mill, at work upon the problem in your behalf; and I believe you would say that there is no such industrial research laboratory in the world as that for which President Wilson has recently given to us \$1,150,000 to construct the building alone.

INDUSTRIAL COOPERATION SERVICE WILL GAIN WORLD TRADE.

Thirdly, through the gracious courtesy of the War Industries Board, we have become the beneficiary of a fine legacy for them in our industrial cooperation service. We want to go step by step with you in the conservation work and the standardization work. We will work with you side by side as long as you will do that with us. We have no use war power; we do not wish it; but we believe that sweet reasonableness will appeal to American business men, and we believe that there is something else that will appeal because the vision of America has grown larger these recent months. You and I have got to go out into the big world beyond the three-mile limit to earn our livelihood henceforth, because such is the capacity of American industry that when it runs continuously full time, we have not the purchasing power in this country continuously to take its product. We have got to sell abroad, all around the world. That means that your shops and mine—for I am interested as you are in factories—that means that your shops have got to be trimmed like an athlete, down to the bone of power and strength, and that individual fancy and individual love for this or that or the other specialty, may have to stand aside because of the country's need for athletic industry, in which there is no waste, in which there are no fancy trimmings, not because the Government has aught any longer to say, but because the country needs the trained soldier of industry just as it has had the trained soldier of war.

And you and I have got to remember that in our industrial work we must be stripped for battle and set aside weights of personal pride and personal desire in order that the great industries which we represent may take their fair and proper place in the peaceful contests of the world. And this conservation service, this industrial cooperation service in almost any form that industry needs, whether it be scientific help or commercial help, whether it be men or information, is at your command. It is as broad in its possibilities as your needs can be.

And finally, the war powers have gone, let us hope not to return. I do not represent the police power of the Government. I want none of it. I would to God it had never to be used. But if you will cooperate closely with the department whose duty it is to help yourself, help you across the globe or in the laboratory or by its scientific men sent to your own shop, if you will pull with us in this common effort, there is very little danger that any police power can ever come near you. And so I bid you welcome to a department's work in your service that is organized. Do you want a man sent abroad to study your problems? Suggest the man. Take from him his personal interest. Separate him from his personal and selfish duties. Send him to us and let him go freely out into the world, if so be only that

he speaks to you all the while away and on his return, for we cannot serve a single house, but we can and shall be glad to serve the rubber industry of the United States.

PRESIDENT WORK.—A toast to Secretary Redfield! (A rising toast was drunk to Secretary Redfield and the guests sang "For he's a jolly good fellow.")

FRRIENDSHIP WONT COME TO ORDER, PLEASE, GENTLEMEN. We have with us to-night another honored guest, Mr. J. Joyce Broderick, Commercial Attaché to the British Embassy. Mr. Broderick has been a good friend of our association through the various phases of the rubber embargo, and our troubles would have been much greater had it not been for the broad-minded view with which he approached the various problems in connection with British control. Mr. Broderick has kindly consented to make a few remarks to us. When he has finished we are going to move away a couple of tables here, and the banquet committee has planned a little further entertainment for you gentlemen.

I take great pleasure in introducing Mr. Broderick.

ADDRESS OF J. JOYCE BRODERICK.

Mr. President, Ladies and Gentlemen:

I am slightly reminded of a story repeated by an English novelist, which told of how a little boy once climbed a rainbow and at the end of the rainbow, behind the clouds, he found a wonderful city. Its houses were of gold and its streets were paved with silver, and the light that shone upon it was like the light that lies on the sleeping world at dawn. And all the men that dwelt in that wonderful city were great and good, and the women were all more beautiful than the women of a young man's dream. And the name of the city was "The City of the Things Men Meant to Do."

ENGLAND THANKS THE AMERICAN RUBBER INDUSTRY.

I do not know whether I should say that I intended to prepare an address which I thought would be befitting an important occasion of this kind, when one of the greatest industries built up by magic in this country of industrial miracles was assembled together to review the achievements that they had accomplished during a period of crisis. But you will probably be glad to hear that I am to address you for only a few moments and I am glad to have them because they give me an opportunity which I have been seeking for a long time, an opportunity to express to the rubber industry of the United States the gratification and the thanks of the government which I have the honor of representing and of the whole British people for the loyal cooperation which we had from you in preventing our enemy from getting rubber or rubber manufactures during a period which to us was of the greatest and most vital importance.

RUBBER GUARANTIES EFFECTIVE.

And I should like to remind you that never during the whole course of what you are all as familiar with as the British rubber agreement, did any British official consider it for a moment necessary to check up the statements you made or to investigate whether you were abiding by your guaranties. I was asked on one or two occasions in the ordinary routine course of inquiry what we were doing to see that those guaranties were observed, and I said: "Nothing. So long as we have the promise of the rubber industry of the United States we can have no better security." And if ever minor questions of difficulty cropped up the chairman of your rubber control committee will bear me out when I say that we did not investigate them, but turned them over to the rubber control committee to dispose of as it pleased.

Now, the experience we had and the contracts that we were fortunate enough to establish during that period have impressed us with the highest respect for American industry in general and for your particular association more especially. The efficiency of the agreements we made and of the agreements you made later, and the regulations that were arranged with the War Trade Board is illustrated by this: that I do not know of one single authenticated case in which a pound of rubber or rubber manufactures or a single dollar representing the profits on any transaction in rubber ever found its way to the Teutonic countries from the United States since the outbreak of the war.

FRIENDSHIP BETWEEN ENGLISH-SPEAKING PEOPLES.

I believe, ladies and gentlemen, that the common sacrifices which have been made in this war have drawn immeasurably tighter the bond of sympathy between the American and the British people.

J. JOYCE BRODERICK.

The Secretary of Commerce has outlined to you some of the difficulties with which the world is now faced. The question of the means which we must adopt to prevent the recurrence of this awful calamity is a question which is engaging the best minds of the world everywhere. I believe that this question will not be solved except in proportion as the American and the British people agree to cooperate toward their solution. Is it too much to hope that in the conflicting interests and the perplexing problems which are facing the world to-day we may count upon

one constant unchangeable thing, an unbreakable, lasting friendship between the English-speaking peoples? If we can count upon that, I look forward to the future with the greatest confidence, for it is upon the cooperation and unselfish working together of the English-speaking peoples, I believe, that the whole peace and prosperity of the world in the future rests. And I know that I speak the thought of all the British people when I now in conclusion express the sincere hope for the continued growth and prosperity of the rubber industry of America.

MEMBERS AND GUESTS PRESENT.

Annual Meeting of The Rubber Association of America.

THE annual meeting of The Rubber Association of America was held at the Waldorf-Astoria, New York City, on January 16, 1919. President Work called the meeting to order and after the call for the meeting, minutes of the previous meeting, report of the president, and the treasurer's report had been accepted, the following announcement was made by Charles T. Wilson:

REPORT OF THE COMMITTEE ON RUBBER AND KINDRED PRODUCTS.

The committee during the past year has continued to cooperate with the War Trade Board and to announce from time to time various regulations prescribed by that body as well as to administer the details connected with the system of rubber control. Their activities have been made the subject of a great many advices sent you during the year.

Our relations with the Government have been most harmonious and hearty support and cooperation have been shown by the industry in carrying out both in letter and spirit what it was called upon to do.

At the request of the War Trade Board we have at times submitted suggestions and plans for their approval, to cover new situations. Perhaps the most important was that of allocating reduced weights of rubber allowed for importation after May 8, 1918, in as fair a manner as possible.

A short time ago we were able to announce that the present system of guaranties and scheme of control had been much simplified; that while rubber would still continue to be consigned to The Rubber Association, manufacturers and importers are no longer required to furnish individual guaranties, and a number of other formalities were abolished.

I am now much pleased to tell you we have just received word, which I believe will be officially confirmed within the next day or so, to the effect that even this nominal control has been abolished by the War Trade Board and that rubber can now be imported and distributed by observing such regulations as the Government may have in effect from time to time.

PRESIDENT WORK: That means that all regulations are now off except the import license; and, of course, there is still a control over the enemy trade.

MR. WILSON: Yes, sir.

CHANGES IN THE CONSTITUTION AND BY-LAWS.

The following changes in the constitution and by-laws were authorized:

BOARD OF DIRECTORS INCREASED TO FIFTEEN.

Section I of Article IV to read:

The Board of Directors shall consist of fifteen firm representatives who shall be elected at the annual meeting, the directors to be divided into three classes to serve one, two, and three years respectively; those to be elected at the annual meeting of 1919 shall be one director to be added to each of the classes whose terms expire in 1920 and 1921, and five directors to be elected for three years, and thereafter all directors whose terms shall then have expired shall be elected for three years.

APPOINTMENT OF ASSISTANT SECRETARIES.

The following to be added to Section 1 of Article V:

and as many assistant secretaries as may be found necessary, who shall be elected as above provided, or appointed by the Executive Committee.

This will involve also making the following changes:

Add to Section 3 of Article V a new paragraph reading:

The assistant secretary, or assistant secretaries, shall perform the duties of the secretary in the latter's absence or disability, and such other duties as may be designated by the Board of Directors or by the Executive Committee from time to time.

Change Section 5 of Article V so that it shall read:

Section 5. The office of secretary, or assistant secretary, and treasurer may be held by the same person.

In Section 2 of Article VI, change the third from the last paragraph so as to read:

The secretary, or an assistant secretary of The Rubber Association of America shall be secretary of the Committee on Arbitration.

In Section II of Article IX change the last sentence to read:

Each division may appoint its own chairman or vice-chairman but the secretary or treasurer of each division shall be the secretary or an assistant secretary and treasurer of this association.

GIVING BOARD OF DIRECTORS AND EXECUTIVE-COMMITTEE EQUAL POWER.

Change the third sentence in Section 1 of Article VI so that it shall read:

The Executive Committee shall, when the Board of Directors is not in session, pass on all elections to membership.

Change the last sentence of Section 1 and the last sentence of Section 2 of Article VIII, so that those sentences shall read:

The endorsement of two directors and a majority vote of the Board of Directors or of the Executive Committee shall be necessary for admission.

Change the first sentence of Article XII so that it shall read:

Entertainments and dinners of the Association may be held at the discretion of the Board of Directors or of the Executive Committee.

Change Article XIV so that it shall read as follows:

If any member shall be charged in writing (addressed to the secretary of the Association) by any other member of the Association with conduct injurious to the good order, welfare, interest or character of the Association or with acts inimical to the interests of the Association and tending to discredit it, or with acts at variance with the requirements of the charter, constitution and by-laws or rules of this Association, or if the Board of Directors or the Executive Committee shall be cognizant of such conduct and acts and prefer charges, the Board of Directors or the Executive Committee shall thereupon inform the member so charged in writing; and if, after giving the person so charged an opportunity to be heard, the Board of Directors or the Executive Committee shall be satisfied of the truth of the charges and that the same demands such action, it may proceed to expel such member or to suspend such member for a period not exceeding six months, or it may request such member to resign; and if such member declines to resign it may proceed to expel him; a two-thirds vote of the entire Board of Directors or of the entire Executive Committee shall be required to expel or suspend.

NEW BOARD OF DIRECTORS.

The four nominees of the nominating committee and the three nominees of members of the association were elected members of the board of directors, the personnel of which follows:

Expiring in 1920: Homer E. Sawyer, chairman; Charles T. Wilson, John A. Lambert, Paul W. Litchfield, G. W. Henne.

Expiring in 1921: Frank A. Seiberling, Harry T. Dunn, Charles J. Davol, William J. Kelly, C. W. MacLaughlin.

Expiring in 1922: J. Newton Gunn, Seneca G. Lewis, J. S. Lowman, A. D. Thornton, John Morgan.

INCOME PROVIDED FOR SUPPORT OF ASSOCIATION.

In order to raise sufficient funds for the continuance of the work of the Association the following plan was proposed:

WHEREAS, it is necessary to provide a sufficient income for the continuance of the growing activities of this Association,

Officials and Board of Directors of the Rubber Association of America, Inc.

J. A. LAMPERT

J. S. LOWMAN

S. G. LEWIS

P. W. LITCHFIELD

HARRY T. DUNN,
First Vice-President

HOMER E. SAWYER
President

FRANK A. SEIBERLING,
Second Vice-President

C. J. DAVOL

C. T. WILSON

H. S. VORHIS,
Secretary-Treasurer

W. J. KELLY

G. W. HENNE

J. N. GUNN

J. MORGAN

A. D. THORNTON

C. W. MACLAUGHLIN,
Chairman of the Board

ciation, and to permit of the accumulation of an invested fund, be it

RESOLVED, that this meeting approves of the charge of a nominal fee of not less than two cents, not more than three cents, per hundred pounds, on all rubber arriving and shipped to manufacturers, and not consigned to The Rubber Association, and be it further

RESOLVED, that the Board of Directors of The Rubber Association be instructed to prepare an equitable plan for this distribution of the cost of and collection of said fee.

After a short discussion the above resolution was unanimously adopted.

PRESIDENT WORK'S CLOSING REMARKS.

PRESIDENT WORK: Now, gentlemen, I want to express my thanks and appreciation to you all for the support you have given me during the past year. It has been a great honor to be president of The Rubber Association during this time. I have enjoyed the work, and I have valued the cooperation and admired the spirit which has actuated the whole country; and from various sources in Washington we hear that no industry in the country gave the Government better support than the rubber industry. I am very proud to have acted as your president during the year. I thank you.

DIRECTORS' MEETING.

THE new board of directors went into session after the annual meeting and elected the following officers:

OFFICERS.

President, Homer E. Sawyer, United States Rubber Co., New York City.

First vice-president, Harry T. Dunn, The Fisk Rubber Co., Chicopee Falls, Massachusetts.

Second vice-president, Frank A. Seiberling, The Goodyear Tire & Rubber Co., Akron, Ohio.

Secretary-treasurer, Harry S. Vorhis, The Rubber Association of America, Inc., New York City.

EXECUTIVE COMMITTEE.

Homer E. Sawyer, chairman, United States Rubber Co., New York City; Harry T. Dunn, The Fisk Rubber Co., Chicopee Falls, Massachusetts; Frank A. Seiberling, The Goodyear Tire & Rubber Co., Akron, Ohio; Bertram G. Work, The B. F. Goodrich Co., New York City; John A. Lambert, Acme Rubber Manufacturing Co., Trenton, New Jersey; William J. Kelly, Poel & Kelly, New York City.

FIRM AND ASSOCIATE MEMBERS ELECTED.

The following firm and associate members were elected on January 16, 1919:

FIRM MEMBERS AND REPRESENTATIVES.

Century Rubber Works, E. B. Tozier, 1346 Rawson street, Chicago, Illinois.

Narragansett Rubber Co., R. S. Emerson, Bristol, Rhode Island.

Needham Tire Co., H. A. Rambonnet, Charles River, Massachusetts.

Trenton Scrap Rubber Co., Isaac Fineburg, Trenton, New Jersey.

United States Rubber Plantations, Inc., Ernest Hopkinson, 1790 Broadway, New York.

Chippewa Rubber Co., Edward Hutchins, Eau Claire, Wisconsin.

The McLean Tire & Rubber Co., W. B. Davis, East Liverpool, Ohio.

The Columbia Tire & Rubber Co., W. G. Henne, Columbiana, Ohio.

Pivin Tube & Rubber Co., A. S. Johnson, 1002 Michigan avenue, Chicago, Illinois.

The Marion Tire & Rubber Co., W. H. Holverstott, Marion, Ohio.

Fred T. P. Waterhouse, Fred T. P. Waterhouse, 82 Wall street, New York City, was transferred from associate to firm membership.

ASSOCIATE MEMBERS.

Arthur W. Lawrence, United States Rubber Co., 1790 Broadway, New York City.

DIVISIONS' MEETINGS.

MEETINGS of the following divisions were held on January 15 and 16, 1919, and officers elected for the ensuing year:

MECHANICAL RUBBER GOODS MANUFACTURERS' DIVISION: John J. Voorhees, chairman, Voorhees Rubber Manufacturing Co., Jersey City, New Jersey; W. H. Yule, vice-chairman, The B. F. Goodrich Co., Akron, Ohio; Harry S. Vorhis, secretary and treasurer, The Rubber Association of America, Inc., New York City. **EXECUTIVE COMMITTEE:** J. J. Voorhees, chairman, Voorhees Rubber Manufacturing Co., Jersey City, New Jersey; George E. Hall, Boston Woven Hose & Rubber Co., Cambridge, Massachusetts; Guy E. Norwood, The Republic Rubber Corp., Youngstown, Ohio; Henry Spadone, Gutta Percha & Rubber Manufacturing Co., New York City; W. H. Yule, The B. F. Goodrich Co., Akron, Ohio; J. H. Cobb, New York Belting & Packing Co., New York City; I. R. Bailey, The Goodyear Tire & Rubber Co., Akron, Ohio; John A. Lambert, Acme Rubber Manufacturing Co., Trenton, New Jersey.

SOLID TIRE MANUFACTURERS' DIVISION.—The Solid Tire Manufacturers' Division was organized and the following officers elected: A. J. Partridge, chairman, Firestone Tire & Rubber Co., Akron, Ohio; Joseph C. Weston, vice-chairman, United States Tire Co., New York City; H. S. Vorhis, secretary and treasurer, The Rubber Association of America, Inc., New York City. **EXECUTIVE COMMITTEE:** A. J. Partridge, chairman, J. C. Weston, and representatives of The Fisk Rubber Co., The B. F. Goodrich Co., The Goodyear Tire & Rubber Co., Hood Rubber Co., and the Kelly-Springfield Tire Co.

PNEUMATIC TIRE MANUFACTURERS' DIVISION.—The Pneumatic Tire Manufacturers' Division was organized and the following officers elected: George M. Stadelman, chairman, The Goodyear Tire & Rubber Co., Akron, Ohio; E. H. Broadwell, vice-chairman, The Fisk Rubber Co., Chicopee Falls, Massachusetts; Harry S. Vorhis, secretary and treasurer, The Rubber Association of America, Inc., New York City. **EXECUTIVE COMMITTEE:** George M. Stadelman, chairman, E. H. Broadwell, and representatives of the Kelly-Springfield Tire Co., Empire Rubber & Tire Co., Hood Rubber Co., The Miller Rubber Co., Portage Rubber Co., Firestone Tire & Rubber Co., General Tire & Rubber Co., Ajax Rubber Co., Inc., The B. F. Goodrich Rubber Co., Pennsylvania Rubber Co., United States Tire Co., Lee Tire & Rubber Co., and the Victor Rubber Co.

RUBBER RECLAIMERS' DIVISION: Francis H. Appleton, chairman, F. H. Appleton & Sons, Inc., Boston, Massachusetts; Clark W. Harrison, vice-chairman, Bloomingdale Rubber Co., New York City; Harry S. Vorhis, secretary and treasurer, The Rubber Association of America, Inc., New York City. **EXECUTIVE COMMITTEE:** Francis H. Appleton, chairman; Clark W. Harrison, vice-chairman; E. A. Anderson, Rubber Regenerating Co., Nauvauk, Connecticut; John S. Clapp, E. H. Clapp Rubber Co., Boston, Massachusetts; R. A. Low, United States Rubber Reclaiming Co., Inc., New York City; John S. Lowman, Philadelphia Rubber Works Co., Akron, Ohio; Joseph F. McLean, Pequannoc Rubber Co., Butler, New Jersey.

RUBBER SUNDRIES MANUFACTURERS' DIVISION.—Charles J. Davol, chairman, Davol Rubber Co., Providence, Rhode Island; H. A. Bauman, vice-chairman, The B. F. Goodrich Co., Akron, Ohio; Harry S. Vorhis, secretary and treasurer, The Rubber Association of America, Inc., New York City. **EXECUTIVE COMMITTEE:** Charles J. Davol, chairman, Davol Rubber Co., Providence,

Rhode Island; Edward E. Huber, Eberhard Faber Pencil Co., Brooklyn, New York; S. H. Jones, United States Rubber Co., New York City; George B. Hodgman, Hodgman Rubber Co., Tuckahoe, New York; W. H. Balch, The Faultless Rubber Co., Ashland, Ohio; W. S. Davison, The Miller Rubber Co., Akron, Ohio.

FOREIGN TRADE DIVISION: E. H. Huxley, chairman, United States Rubber Export Co., Ltd., New York City; R. H. Daniels, vice-chairman, The Goodyear Tire & Rubber Co., Akron, Ohio; Harry S. Vorhis, secretary and treasurer, The Rubber Association of America, Inc., New York City. **EXECUTIVE COMMITTEE:** E. H. Huxley, chairman, United States Rubber Export Co., Ltd., New York City; Henry G. Tyer, Tyer Rubber Co., Andover, Massachusetts; William B. Loughton, Hood Rubber Co., Watertown, Massachusetts; A. R. Gormully, Ajax Rubber Co., Inc., New York City; A. S. Hardy, Manhattan Rubber Manufacturing Co., New York City; R. H. Daniels, The Goodyear Tire & Rubber Co., Akron, Ohio; C. G. McCullough, Pennsylvania Rubber Co., Jeannette, Pennsylvania.

RUBBER PROOFERS' DIVISION:—H. M. Dannenbaum, chairman, Schwarzwaelder Co., Philadelphia, Pennsylvania; J. J. Clifford, vice-chairman, Plymouth Rubber Co., Canton, Massachusetts; Harry S. Vorhis, secretary and treasurer, The Rubber Association of America, Inc., New York City. **EXECUTIVE COMMITTEE:** H. M. Dannenbaum, chairman; J. J. Clifford, E. Bucher, Vulcan Proofing Co., Brooklyn, New York; J. V. McHose, Scioto Rubber Co., Columbus, Ohio; James Meade, Meade Rubber Co., Stoughton, Massachusetts.

FOOTWEAR DIVISION.

The following is the personnel of the newly organized Footwear Division: George H. Mayo, chairman, United States Rubber Co., 1790 Broadway, New York City; Francis S. Dane, vice-chairman, Hood Rubber Co., Watertown, Massachusetts; Harry S. Vorhis, secretary, The Rubber Association of America, New York City; Hugh Bullock, Converse Rubber Shoe Co., Malden, Massachusetts; Robert S. Emerson, Narragansett Rubber Co., Bristol, Rhode Island; A. S. Funk, La Crosse Rubber Mills Co., La Crosse, Wisconsin; W. G. Hill, Apsley Rubber Co., Hudson, Massachusetts; T. W. McDowell, Goodyear Rubber Co., Middletown, Connecticut; L. T. McCollum, Mishawaka Woolen Manufacturing Co., Mishawaka, Indiana; Francis R. McKenna, Bourn Rubber Co., Providence, Rhode Island; Ted Nicar, Firestone Tire & Rubber Co., Akron, Ohio; George W. Prall, Lambertville Rubber Co., Lambertville, New Jersey; J. A. Rishel, The B. F. Goodrich Co., Akron, Ohio; L. C. Warner, Beacon Falls Rubber Shoe Co., Beacon Falls, Conn.

TRAFFIC DIVISION.

The Traffic Division meetings were held at the Transportation Club, Manhattan Hotel, New York City, on January 15 and 16, when the following subjects in connection with domestic and foreign transportation problems were discussed: Advance in express rates; proposed elimination of exceptions to the official classification; standardization of statistical accounts in individual traffic departments of the association members and compilation of various statistics in this office; marking of cases containing crude rubber; trans-continental rates on rubber soling; trans-continental rates on rubber mats and matting; rates on crude rubber; ratings on tires under the Iowa State classification; consolidated classification as related to rubber and its products; permits for carload export shipments; lighterage of export freight in New York harbor; demurrage and storage in connection with export freight; priority movement for export freight in carloads; packing of rubber belting and hose; differential rates for export and import freight; rubber packing and tubing.

The Traffic Committee is composed of the following members: George F. Hiltborn, chairman, United States Rubber

Co., 1790 Broadway, New York City; R. G. Kreitzler, The Goodyear Tire & Rubber Co., Akron, Ohio; A. D. Phillips, The Fisk Rubber Co., Chicopee Falls, Massachusetts; E. R. Traggesser, The B. F. Goodrich Co., Akron, Ohio; A. L. Viles, manager, 52 Vanderbilt avenue, New York City; Harry S. Vorhis, treasurer, The Rubber Association of America, Inc., New York City.

RUBBER HEEL CLUB.

A meeting of the Rubber Heel Club of America was held at the Yale Club, New York City, on January 16, 1919. The officers are: president, Robert H. Cory, O'Sullivan Rubber Co., New York City; secretary, George H. Stetson, 370 Atlantic avenue, Boston, Massachusetts; directors: Robert H. Cory, O'Sullivan Rubber Co., New York City; C. H. Oakley, Essex Rubber Co., Trenton, New Jersey; Charles Measure, Federal Rubber Co., Milwaukee, Wisconsin.

COMMUNICATIONS OF THE RUBBER ASSOCIATION WAR SERVICE COMMITTEE DISCHARGED.

January 3, 1919.

To all members of the rubber trade:

The board of directors of The Rubber Association of America has decided that the work of the War Service Committee of the Rubber Industry shall terminate at the time of the annual meeting of the Association, January 16, 1919.

BLANKET GUARANTIES REQUIRED.

January 6, 1919.

To importers, dealers and manufacturers:

The War Trade Board has authorized a marked simplification in the procedure covering the disposition of rubber arrivals. Instead of individual guaranties, as now required from manufacturers and importers against each delivery, blanket guaranties, as per form "A" for manufacturers and form "B" for importers, will be all that is necessary from those whose guaranties have heretofore been acceptable to the War Trade Board.

FORM A.

MANUFACTURER'S GUARANTY.

WAR TRADE BOARD,

Washington, D. C.

Through the Rubber Association of America, Inc.

GENTLEMEN:

In consideration of your consenting to the delivery to me/us of crude rubber, gutta jelutong, scrap or reclaimed rubber, gutta percha, gutta siak and/or balata I/we agree to comply with all regulations of the War Trade Board as now in force or which may be promulgated affecting the importation and exportation of the foregoing commodities and manufactures thereof and to furnish on demand such information as the War Trade Board may require concerning the importation and disposition of said commodities and the manufactures thereof.

(Signature of manufacturer.)

Date

FORM B.

IMPORTER'S GUARANTY.

WAR TRADE BOARD,

Washington, D. C.

Through The Rubber Association of America, Inc.

GENTLEMEN:

In consideration of your granting to the undersigned licenses to import crude rubber, gutta jelutong, scrap or reclaimed rubber, gutta percha, gutta siak and/or balata, I/we hereby agree to comply with all regulations of the War Trade Board as now in force, or which may be promulgated, affecting the importation and exportation of the foregoing commodities and to furnish on demand such information as the War Trade Board may require concerning my/our importation and disposition of such commodities.

I/we also agree not to dispose of any of the aforesaid commodities except to such firms or individuals as shall have executed the agreements required by the War Trade Board.

(Signature of importer.)

Date

The following formalities, heretofore required, are dispensed with:

1. Filing of importers' and manufacturers' guaranties against each delivery.
2. Filing by importers with the Association of transportation or other receipt as proof of delivery.
3. Receipts from manufacturers.
4. Warehousing of rubber in the name of the Rubber Association of America, Inc., by importers.

leaving the control exercised by the War Trade Board substantially as follows:

- (a) Conditions outlined in the guaranty.
- (b) All rubber shall continue to be consigned to The Rubber Association of America, Inc.
- (c) Importers to make application for endorsement of bill of lading on Form "C," and if required by the War Trade Board, to report the disposition of the commodity covered by the bill of lading.
- (d) Importing manufacturers will make application for endorsement of bill of lading on Form "D."
- (e) The Association will enter the particulars given in said application upon their records for the information of the War Trade Board.

Manufacturers will please sign Form "A" and importers Form "B" and return as early as possible.

Inasmuch as this will do away with a great deal of clerical work now employed in keeping the records, a substantial decrease, effective January 10, 1919, in certain registering charges, has been authorized by the executive committee of the Association. They will be as follows:

Crude rubber, balata and gutta percha.....5c per 100 lbs.
Gutta siak and Pontianak.....2½c per 100 lbs.
Supplies of forms "C" and "D," to be used for making application for endorsement of bill of lading, can be obtained upon request to the secretary.

CRUDE RUBBER IMPORTS PRACTICALLY UNRESTRICTED.

JANUARY 20, 1919.

To importers, brokers and dealers:

The following two advices of importance have been received from the War Trade Board:

(a) Circumstances have now permitted the removal of the control which the War Trade Board has previously exercised through this Association over importations of crude rubber, jelutong, balata, gutta siak, gutta percha, scrap and reclaimed rubber.

Hereafter, therefore, import licenses for these commodities will not require that bill of lading be endorsed to the Association, and Collectors of Customs have been advised to disregard this provision on all outstanding licenses for said commodities.

(b) The War Trade Board announce that, effective immediately, all American Consuls have been instructed to consulate invoices covering all unrestricted commodities without the necessity of the production of United States import license number.

This will make it unnecessary for importers to cable license numbers on unrestricted commodities and thereby simplify the import procedure.

All Collectors of Customs have been advised of the withdrawal of this regulation, and furthermore instructed to permit entry of merchandise covered by unused and outstanding licenses for unrestricted commodities provided license is otherwise in order, without regard to license numbers.

The War Trade Board desires to impress upon importers for their own protection and to avoid the possibility of shipments being made for which license may be refused, on account of failure to observe the enemy trade regulations, or for other reasons, that they should obtain import licenses before shipments are effected.

From the contents of the above it will be observed:

1. That shipments of the commodities mentioned should no longer be consigned to The Rubber Association of America.
2. That importers of crude rubber are no longer under the necessity of cabling license number to their shippers.

COMMITTEE ON RUBBER & KINDRED PRODUCTS.

"Rubber Machinery," by Henry C. Pearson, is filled with valuable information for rubber manufacturers. Price, \$6.

RUBBER FOOTWEAR SEASON IN CANADA.

The revised price list on rubber footwear has been issued in Canada a month earlier than usual, pursuant to an agreement made by the middle western jobbers with the manufacturers. This permitted salesmen in Manitoba, Saskatchewan, and Alberta to start out on January 15 with both rubber and felt lines. No samples will be carried, all sales being made from catalogs, thus saving expense and time. The fact that there are practically no new styles this year made this procedure possible.

The season in British Columbia, Ontario, Quebec, and the Maritime provinces will open March 3 as usual.

THE DUNLOP GREATER PRODUCTION PLAN.

In 1914, the Dunlop Tire & Rubber Goods Co., Limited, Toronto, Ontario, increased its property holdings by leasing 14 acres in East Toronto, primarily as a recreation ground. Events since then have made it desirable to use part of the space for gardening. About eight acres are now under cultivation, the balance being used by the Dunlop Amateur Athletic Association for all kinds of outdoor sports. The first gardens were laid out in the spring of 1914, before the war started. No less than one hundred gardens are being worked, with the possibility of half as many more for next spring. The Toronto Rotary Club has assisted in the garden work. One Dunlop employee produced on his plot, during 1918, the following vegetables: 18 bags of

A PART OF DUNLOP FIELD IS DEVOTED TO EMPLOYEES' GARDENS.

potatoes, 700 pounds of turnips, 200 pounds of parsnips, 300 pounds of carrots, 500 pounds of beets, 100 pounds of dried beans, 75 pounds of string beans, one-half ton of onions, 15 baskets of tomatoes, 300 cabbages, 85 heads of celery, lettuce and radishes by the bagful, brussels sprouts, etc.

The Dunlop company also operates a large lunch-room where hot coffee is served daily to employees who bring their lunch. There is, in addition, a lunch-room for the office staff where a wholesome meal can be had at less than cost. Adjoining are a reading and rest-room and a fully equipped hospital-room with a qualified nurse in attendance.

Bowling has been encouraged and also all sporting events having to do with the bicycle, motorcycle, or automobile. The Dunlop trophy race is an example of the extent to which the company goes in promoting the automobile or bicycle business, besides its prizes for sporting events throughout Canada.

A successful picnic, many football matches and various events in aid of the community have been held on Dunlop Field.

SWEDISH FACTORY DOUBLES CAPITAL.

The Helsingborg Rubber Manufacturing Co. of Helsingborg, Sweden, has recently increased its capital from 3,000,000 to 6,000,000 kroner.

Guayule Cultivation a Success.¹

In response to scores of requests the following article, written by the Editor of THE INDIA RUBBER WORLD, which appeared in this paper in July last, is reprinted. The writer is well aware that the story is startling and almost unbelievable, but after further examination of existing plantings, he discovers no reason to change the opinion first formed or in any way to modify the original statements.

ONE must go back at least ten years. Of all the companies operating in Mexico, one was preeminent, in product, processes, and in vast holdings of land. It was an American concern, with ample capital, and unusual administrative talent. To those in charge it was perfectly apparent that the time would come when the wild guayule fields would be exhausted and the business stop entirely or shut down until new plants matured. Whether regrowth could be induced or the shrub be raised from seed or cuttings, none knew. Most of those who were asked con-

established laboratories and experimental plants, and the work on a commercial scale actually commenced.

Prior to the actual planting for commercial product, the plant was practically remade to meet the necessities in the case.

AS TO SEED SUPPLY.

The seed of the guayule is very minute, and if one examines the desert plant, very unsatisfactory. In the heads that should hold good seeds will be found half-developed dried husks of seeds and very few good ones. As vital seed, and plenty of it,

GUAYULE SEED BEDS.

cerning this were positive in their declarations that it would never yield to profitable cultivation. The actual head of the company, a man of broad vision, although careful and conservative, believed that with sufficient effort the impossible could be done. Under his direction, therefore, the work was begun.

MEXICAN PRELIMINARIES.

The first thing was the selection of a crop of chemists, botanists, plant physiologists, and experts in desert plants. For this they drew men from agricultural colleges, desert laboratories and experiment stations, arranging to send their notes and conclusions to these seats of botanical learning, receiving from them knowledge in return. This body of men, which was added to from time to time, embraced such well-known names as Dr. Francis E. Lloyd, Dr. Theodore Whittelsey, Dr. J. E. Kirkwood, Professor C. L. Hare, Professor J. P. C. Southall, Dr. W. B. McCallum and half a score of others.

These scientists took up the following subjects and exploited them most thoroughly. Geographical and altitudinal distribution, climate, air and soil temperatures, rainfall, soil moisture, and relative humidity, analysis of soils and of plants under all conditions, diseases, effects of drouth, rain and of irrigation; seeds, leaves, flowers, stems and roots were subjected to the closest scrutiny, under a multiplicity of conditions, and the results all tabulated.

In time their work begun in Mexico was transferred to the United States, notably to California and Arizona. Here were

is an essential, the guayule trainers took hold of the shrub, planted it under varying conditions, fed, watered, starved, and petted it until it was learned positively just what conditions were necessary to full seed pods. In time the barren seed vessels became full ones, and the treatment necessary to get this result became a matter of record.

GERMINATION.

It may not be generally known, but seeds of some plants, seeds that are vital, and that should germinate without difficulty, refuse to do so. This seems to be particularly true of certain desert growths. For example, there is a cactus distributed very generally through the southwest that bears seeds in abundance. So far, however, no one has been able to get these seeds to germinate. It was not on the cards that guayule should prove to be in this class. It promised so many other disabilities that it did not seem possible that it had this also. Nevertheless when the first bushel of seeds was carefully sown not one germinated. And so it was with succeeding lots. There was nothing to do but sow smaller lots under every condition that could be thought of, and learn just what was required. For a long time only failure resulted and gloom settled on the experimenters. Then an accident pointed the way and soon this problem, too, was solved.

SPEEDING UP THE GROWTH.

The problem of speeding up the growth of the plant was one of the most interesting and vexing of all. Left to itself in its desert home under normal conditions, a guayule seedling takes some twenty years to arrive at maturity, that is, as a rubber-bearing proposition. It grew a little at a favorable season each

¹From "Production of Guayule Rubber," by Henry C. Pearson. Commerce Report No. 149, June 26, 1918.

year. The rest of the time it existed, did not grow, nor do anything but sleep. Now, it is exceedingly difficult to get tree, shrub, or plants to do anything that they and their forebears have not previously done. They are hidebound in their prejudices, rock-ribbed as to their habits. They have no ambition to speed up, to be efficient, to be different. These plant prejudices must first be understood and habits broken by coaxing, cajoling and fooling. For example, the guayule habit of a slight growth in the spring once a year was noted by the plant physiologist, who took advantage of it in this way. He furnished a simulated spring and the guayule responded, then before it could settle back for months of rest, another spring was sprung. If done at the exact psychological moment the plant responds. Again and again was this done, and the plant, having no method of checking up its rapidly recurring seasons, attained a lusty growth in record time. By this method the fifteen-year development that the shrub was accustomed to, and that it prefers, was accomplished in four years.

VARIETIES OF SHRUBS.

One of the very interesting preliminaries in guayule cultivation was the study of varieties. To the average guayule expert there were but two types of plants, the *Parthenium Argentatum* which is the rubber producer, and the *Mariola*, *Parthenium Icanum*, which much resembles it but contains no rubber. From the beginning, the botanists began to segregate the rubber-producing species into a great variety of types. The new species, the *Parthenium Lloydii*, named after Professor Francis E. Lloyd, is one of these varieties, characterized by differences in leaf, flower, root growth, rubber content, etc., etc. Dr. McCallum, in whose desert laboratory the most of this work was done, published a statement in "Science" long ago that he had found 125 different species.* He told the writer that his records showed to date more than 900 different guayule growths and that the list was still growing.

THE RUBBER CONTENT.

From the beginning of the experiments much care was taken in the analysis of thousands of shrubs to learn all that could be

over. The facts tabulated showed that there was a wide difference in the amount of rubber in the different shrubs. This ran from one per cent to ten per cent to twenty per cent, and in rare cases to twenty-seven per cent. Manifestly seed from the one per cent would not pay to collect, much less to plant. The poorer qualities were therefore thrown out and plants that were big producers were selected as seed bearers for the future cultivated shrub.

QUALITY INVESTIGATION.

Guayule rubber has not been considered to be of the highest grade. When it first came upon the market its resin content was so high and it was so soft that it was accepted with reluctance. Indeed certain importers for years refused to allow that it was rubber at all and scornfully dubbed it a substitute. In time, however, by new methods of extraction, and by deresination, it came into its own as a valuable crude rubber and was used by the millions of pounds.

The searchers for guayule secrets, when they began to test the quality of the rubber in different plants, learned some more surprising truths. Some of the shrubs gave simply a black resinous paste that contained not enough rubber for extraction. Others contained rubber with say twenty per cent of resin, the type that the whole trade is familiar with. A few, however, yielded a firm hard product, low in resin and showing to a remarkable degree the "nerve" that is so characteristic of the best crude rubber.

The result was, of course, that the best producers were planted as seed bearers for cultivated guayule.

Nor was that all. By hybridization, that is the wedding of the big producers with the best producers, plants were produced that had the good qualities of each. Therefore with a big, best producing seed stock the real cultivation of guayule was well on the way toward success.

SOLVING THE LABOR PROBLEM.

In an age when almost everything is done by machinery, the growing of india rubber, particularly the tapping and gathering, is hand work entirely. Without vast gangs of coolies the production of rubber in any considerable amount seems impossible.

A FIELD OF CULTIVATED GUAYULE.

learned concerning the rubber content in them. First of all, the portions of the plants containing rubber were cataloged. This was important in determining whether it was wiser to uproot the plant for the sake of the rubber in the roots or to cut it off above the roots, leaving them to produce new growths. With cultivation in sight, however, there was much more to be learned than the portion of the plant richest in rubber. That was whether the ten per cent of rubber, the rough estimate of the whole rubber content, was at all variable. The results of the analyses were so astounding that they were done several times

With the cultivation and collection of guayule rubber, however, machinery takes the place of men, and in almost every part of the work. The preparation of the fields is done by disk harrows drawn by tractors. The planting by specially built machines, similar to tobacco planters that plow four furrows, set the plants at the proper intervals, cover them in and pack the earth about the roots. One machine plants eighteen acres a day. The cultivating is also done by machinery. For gathering there are two systems; one cutting the rows down by a ha vesting machine, the other plowing the plant out root and all, as in the harvesting of

the sugar beets. The extraction of the rubber is also, of course, wholly mechanical. In the event that the rubber is desiccated, that is also done by machinery and follows the well-known process.

Guayule growing in a large plantation involves a laboratory for examining and testing plant and product, a small greenhouse for seed experiment and hybridization, outdoor plants for seed bearing, seed beds protected by lattice windbreaks, an irrigation system, planting and harvesting machinery, an extraction plant, and above all, knowledge of the plant, and how to handle it, and plenty of capital.

RUBBER TRADE INQUIRIES.

THE inquiries that follow have already been answered; nevertheless they are of interest not only in showing the needs of the trade, but because of the possibility that additional information may be furnished by those who read them. The editor is therefore glad to have those interested communicate with him.

(686.) A manufacturer inquires where he can buy black stamping ink for use on cold-cured pure gum articles, the ink to be unaffected by the curing solution and not to rub off after goods have dried.

(687.) A correspondent desires the address of the manufacturer of Brandt's cement.

(688.) An inquirer asks for the addresses of concerns furnishing supplies for the manufacture of rubber stamps.

(689.) A request has been received for the addresses of concerns that can use hard-rubber battery jars as scrap material.

(690.) A subscriber requests the addresses of several manufacturers of combination stoppers for hot-water bottles.

(691.) A correspondent desires plans for model rubber-tire manufacturing plants.

(692.) A subscriber asks where he can purchase machinery for the manufacture of hard-rubber combs.

(693.) A manufacturer requests the addresses of makers of aluminum inner-tube poles.

(694.) A correspondent desires addresses of manufacturers of bone naphtha or Dippel's oil.

(695.) A correspondent inquires for the addresses of concerns manufacturing tread-punching and stud-setting machines.

(696.) An inquiry has been received for data on the name of some standard work dealing with figuring costs for the production of rubber tape and coated fabrics.

TRADE OPPORTUNITIES FROM CONSULAR REPORTS.

Addresses may be obtained from the Bureau of Foreign and Domestic Commerce or its district or cooperative offices. Request for each should be on a separate sheet, and state number.

(27,917.) A commercial agent in the Netherlands wishes to secure an agency for the sale of rubber goods, first and second qualities, for technical and surgical purposes. Terms, cash with discount of 2½ per cent, or 30 days, 2 per cent discount. Correspondence may be in English.

(27,933.) A man in France desires to secure an agency for or will purchase raincoats. Terms, payment against documents. Correspondence should be in French.

(27,943.) An agency is desired by a man in Norway for the sale of elastic webbing. Quotations should be made f. o. b. New York. Payment to be made cash against documents, confirmed New York credits established. Correspondence may be in English.

(27,956.) A man in Italy desires to secure an agency for the sale of all rubber articles for druggists. Correspondence should be in French or Italian.

(27,958.) A citizen of Costa Rica, who is at present in the United States and about to return to that country and Cuba as

a traveling salesman, desires to secure agencies for the sale of automobile supplies. Terms, cash in New York.

(27,959.) An agency is desired by a man in France for the sale of motor-car accessories throughout Roumania and the Balkan States. Correspondence in French preferred.

(27,962.) An agency is desired by a man in Italy for the sale of rubber goods of all kinds. Correspondence may be in French and Italian.

(27,964.) A partner of an import and export firm in France, who is now in this country, wishes to be placed in communication with large manufacturers with a view to securing agencies for the sale of rubber goods.

(27,988.) A firm in France desires to purchase, for immediate delivery, motorcycle and bicycle accessories. Terms, cash in New York.

(28,016.) A man in Italy desires to secure an agency for the sale of rubber articles. Correspondence should be in French or Italian.

(28,035.) A business man in Algeria desires to purchase or secure an agency on commission for the sale of raincoats for men. Correspondence may be in English.

(28,036.) A man in Italy desires to purchase or secure an agency for the sale of motorcycle accessories. Cash will be paid. Correspondence should be in Italian or French.

(28,051.) An agency is desired by a man in France for the sale of automobile accessories. Correspondence may be in English.

(28,054.) A firm in Italy desires to purchase and also secure an exclusive agency for solid rubber tires for passenger cars and trucks. Correspondence should be in Italian.

(28,080.) A Frenchman, who is now in this country, desires to secure an agency for automobile accessories.

(28,081.) A firm in Italy desires to secure an agency for the sale of automobile accessories. Correspondence should be in French or Italian. Catalogs should be sent and samples also, where possible.

(28,089.) A man in Italy desires to secure an agency for the sale of bicycle accessories. Correspondence may be in English.

(28,093.) A firm in Italy desires to purchase or to secure an agency for the sale of rubber tires. Quotations should be made f. o. b. Terms, cash, with discount, through bank. Correspondence may be in English.

(28,095.) A firm of Chinese merchants in Trinidad desires to secure an agency for the sale of rubber tires.

(28,106.) An agency is desired by a man in France for the sale of motor-car accessories and belts. Correspondence should be in French.

(109,220.) A market for inexpensive toys exists in Algeria; also for sporting goods, and games. A list of the principal dealers in toys may be obtained from the Bureau of Foreign and Domestic Commerce or its district and cooperative offices.

UNITED STATES GOVERNMENT SALES.

The Material Disposition Section, Chemical Warfare Service, U. S. A., 19 West 44th street, New York City, offers the following equipment and material for sale:

A newly constructed steel building, with its equipment, located in Astoria; material from several large plants in Long Island City, formerly employed in making gas masks, gas and other products. Also grinding material, leather belting, shafts, locomotive cranes, cloth cutting machines, cloth presses, rubber testing machines, laboratory apparatus and chemicals, lathes, milling and sewing machines, platen cutting and creasing presses, piping and fittings, rubberized fabrics suitable for raincoats, ponchos, rubber boots and high-grade rubber specialties, fabrics used in manufacturing gas masks, specially prepared fabrics, absolutely waterproof binder fabric suitable for raincoats, elastic tape, chemicals, steel drums, laundry machinery and all classes of office furniture and accessories.

In addition, about forty carloads of gas masks, besides their parts, are scheduled to be sold at the highest bidders.

Echoes of the Great War.

SUPPLEMENTAL INFORMATION SHEET X-2 NO LONGER REQUIRED.

THE War Trade Board announced under date of January 4, 1919 (W. T. B. R. 477), that applicants for export licenses will no longer be required to attach to their application Supplemental Information Sheet X-2, except in the case of applications for the exportation of arms, ammunition or explosives.

PROCEDURE GOVERNING EXPORTS TO HOLLAND AND DENMARK.

The War Trade Board announces in a new ruling (W. T. B. R. 500) that exporters in the United States, before filing application for export licenses must obtain from the prospective importers in Holland or Denmark advice by mail or cable that there has been issued by the Netherlands Overseas Trust, in the case of Holland, or by the Danish Chamber of Manufacturers, or Merchants' Guild of Copenhagen, in the case of Denmark, a certificate permitting the importation of the proposed consignment. The number of the certificate should be forwarded by the importer in Holland or Denmark to the American exporter, by cable or mail, either directly or through the Netherlands Legation, Washington, if for Holland, or the Danish Trade Commission, Washington, if for Denmark.

Henceforth the details of all the import certificates issued in Holland or Denmark will be transmitted by the Netherlands Legation or the Danish Trade Commission in the United States to the War Trade Board, Washington. All inquiries regarding import regulations and certificates should be addressed, for Holland, to Dr. W. H. de Beaufort, Counsellor of Legation, 1800 Connecticut avenue, N. W., Washington, D. C., or, for Denmark, to Mr. N. P. Arnstedt, Danish Trade Office, 1838 Connecticut avenue, N. W., Washington, D. C. Inquiries concerning Denmark can also be addressed to the Danish Consul General, 8-10 Bridge street, New York City.

PROCEDURE GOVERNING EXPORTS TO SWEDEN.

The United States War Trade Board has been advised that the Swedish rubber import association will accept, on behalf of the Swedish importer actually interested, consignments of rubber and rubber goods, when the shipment is covered by a certificate of the said association. All inquiries regarding the numerous Swedish import regulations and import certificates should be addressed either to A. R. Nordvall, Special Commissioner, 1325 18th street, N. W., Washington, D. C., or else to the Swedish Commission Trade Office, 60 East 42nd street, New York City. All Swedish import questions or difficulties relating thereto should be settled before filing applications with the United States War Trade Board.

PROCEDURE GOVERNING EXPORTS TO NORWAY.

In accordance with War Trade Board Ruling 497, exporters in the United States, before filing applications for export licenses, must obtain from the prospective importer in Norway advice by mail or cable that there has been issued by an appropriate import association, or by the Norwegian Finance Department, a certificate permitting the importation of the proposed consignment. This certificate must be either issued or confirmed subsequently to May 10, 1918. The number of this certificate must be forwarded by the importer in Norway to the American exporters, either directly or through the Norwegian Legation in Washington.

Hence the details of all the important certificates issued in Norway will be transmitted by the Norwegian Legation to the War Trade Board in Washington. All inquiries relating to regulations and certificates should be addressed to the Norwegian Legation, Commercial Department, Washington, D. C.

EXPORTATION TO RUSSIA.

In accordance with War Trade Board ruling No. 470, export licenses will henceforth be issued to approved consignees for the shipment of all non-conserved commodities to Siberia. It is no longer necessary to consign shipments to that country to the War Trade Board representative at Vladivostok.

Applications should be submitted on Form X, to which should be attached such supplemental information sheets as are required by the rules and regulations of the War Trade Board for the exportation of certain commodities. No other supplemental information sheets are required, and no import licenses need accompany the application.

SERVICE NOTES AND PERSONALS.

Corporal John D. La Flesh, former factory cost clerk of The Fisk Rubber Co., Chicopee Falls, Massachusetts, has been cited for gallantry in action by Major-General Clarence R. Edwards, formerly commanding the 26th Division.

Ellis Harlow, son of Robert C. Harlow, the president of the Monaquet Rubber Works Co., South Braintree, Massachusetts, is particularly commended for bravery in Major Carroll Swan's new book, "My Company." This company, before the war, was of the well-known military organization, First Corps Cadets, and is now part of the famous 101st United States Engineers, still overseas.

Corporal Charles Marston, of the Loyal North Lancashire Regiment, has been awarded the Military Medal for gallant conduct and devotion to duty on the field. He was formerly employed by the Leyland and Birmingham Rubber Co., Leyland, England.

Auguste Choteau, vice-president of Bittel-Leftwich, Lindell Boulevard and Grand avenue, St. Louis, Missouri, a tire repair and service organization, is a lieutenant in France.

Lieutenant A. Klipstein, Jr., lately attached to the General Staff, having been discharged from the Army after 18 months' service, has taken up his former connections with A. Klipstein & Co., dealers in chemicals, 644-652 Greenwich street, New York.

Sergeant Edward Martin, son of A. W. Martin, plant manager of the Chelsea, Massachusetts, mill of Everlastik, Inc., has been cited for bravery by Major-General Clarence R. Edwards, formerly commanding the 26th, or Yankee Division. After all the stretcher-bearers attached to B Company, 102d Machine Gun Battalion, had been killed, Sergeant Martin volunteered to go out into No Man's Land and bring in the wounded. Although badly gassed he escaped otherwise unharmed. While convalescing in the hospital he volunteered for a blood transfusion which saved another soldier's life.

MARTYRS TO THE CAUSE OF LIBERTY.

Major F. A. Robinson, M. C. (with bar), 10th Tank Battalion, has been reported killed in action at Catillon, near Le Cateau, France. He was formerly in the electric light department of the India Rubber, Gutta Percha and Telegraph Works Co., Silver-town, England.

John J. Connolly, a private in the 327th Infantry was killed in action on October 12, 1918. He was employed at the Valley Street plant of the Revere Rubber Co. before enlisting.

Eugene F. Laforest, a member of E Company, 301st Engineers, died of bronchial pneumonia in France on December 12, 1918. Prior to entering the Army, he was employed by the Glendale Webbing Co.

Corporal Ernest Munroe, who is reported to have died in France of bronchial pneumonia, was a clerk with the National India Rubber Co., at the time of his enlistment in A Battery, 103rd Field Artillery, Rhode Island National Guard.

Application of Catalysis to Vulcanization.¹

Specially Contributed by André Dubosc.

THE part played by sulphydric acid, produced by the action of resins during vulcanization, having been explained, let us see what can be the part played by sulphocyanic acid (CN_2HS) which is formed by the action of the proteins, of the glucosamine on the polymeric sulphur at the temperature of vulcanization.

The part it plays is very simple, it is that of a condenser which determines the polymerization and therefore the increase of resistance to breaking of the caoutchouc.

The sulphocyanic acid, $\text{C}-\text{S}-\text{N}_2\text{H}-$, has four free valences.

It is therefore susceptible of saturating two double combinations belonging to two diereent molecules of caoutchouc molecules, the other double combinations of which have been saturated by colloidal sulphur.

CONDENSATION OF TWO MOLECULES.

We can therefore appreciate the justice of the observations of Lock and Bamber, who declared that the purer a gum is, the freer it is from proteins, the less (after vulcanization) is its resistance to rupture and, therefore, its polymerization. Nature has therefore placed in the gum the elements necessary to its vulcanization and its polymerization, the resins which act as accelerators, the proteins which, in the presence of sulphur, form a condenser which determines the polymerization. Can we reproduce at will, synthetically, by the aid of simpler and more energetic products than the natural proteins and resins, these conditions which analysis has revealed to us? We cannot doubt it, for we know a certain number of nitrogenous substances, which, when heated with sulphur and carbon, are capable of producing abundantly sulphydric acid and sulphocyanic acid. These reactions of formation are produced, for example, in the distillation of coal which contains nitrogen, sulphur and carbon.

This does not mean that coal can act in caoutchouc during vulcanization, the same as proteins and resins act, for the simple reason that the reactions which we have described take place in the case of coal only at temperatures at which the gum would be entirely destroyed.

A substance cannot act as catalyst during vulcanization, substituting itself for the useful substances which the natural gum contains, and producing effects which are similar, but more rapid, more complete and extensive, unless it rigorously fulfils certain conditions.

It must contain, in proper proportions, the quantities of carbon, hydrogen, oxygen and nitrogen necessary to produce the compounds reacting in the vulcanization, that is to say, the sulphydric, sulphurous and sulphocyanic acids. It must be dissociated at the temperature of vulcanization, 135 to 145 degrees C., so that, in the presence of sulphur, the hydrogen, oxygen, nitrogen or the cyanhydric acid necessary to the formation of the bodies named, may be set free. It must, therefore, meet both chemical and thermo-chemical requirements.

Further, the accessory products of the dissociation must have no bad effect on the caoutchouc during the curing, must not produce a disagreeable, persistent odor, and must cause no change in the final product.

Considering the varied results expected from these substances, we can already see that, from the point of view of classification, we must attribute two principal functions to them: (1) a function of acceleration which, in the presence of sulphur, at a proper temperature, will enable them to form sulphydric acid and sulphurous acid; (2) a function of vitalization which, in the presence of sulphur, at the temperature of vulcanization, enables them to form a condenser, the sulphocyanic acid, capable of producing the polymerization of the gum.

A complete catalyst must be at one and the same time: (1) a sulphydric accelerator, (2) a sulphurous accelerator, (3) a sulphocyanic condenser.

Certain substances have two functions and three characteristics, others have one function and two characteristics, while others have two functions and two characteristics. Some have only the function of sulphydric accelerators; they are the compounds which in dissociating at 135 degrees C. furnish hydrogen or acetylene, substances which, in the presence of sulphur, produce in their turn sulphydric acid. This is the case of the resins and of a good many of the bases of the fat series. These catalysts are of only very little interest.

Others have the function of sulphurous accelerators, such as the metallic oxides, as litharge, and the part they play is so well known as to render further explanation unnecessary. There are others which have the full accelerating function; they are sulphydric accelerators as well as sulphurous accelerators, such as the easily decomposable organic hydroxide compounds which, in the presence of sulphur, give sulphurous acid and sulphydric acid.

This is the case with certain alcohols and of most phenols. Certain members of the terpene series, such as camphor, behave in the same way and have two accelerating qualities. Other compounds possess only the vitalizing function and can produce only sulphocyanic acid, for example, cyanhydric acid and most of the cyanides; they yield their maximum effect only in the presence of other compounds, such as sulphide of carbon, which brings them a complement of carbonated elements.

Finally certain substances, which are complete catalysts, have both functions and are at the same time sulphydric and sulphurous accelerators and vitalizers; such are the dinitrated derivatives of the amines as paranitroso dimethylaniline.

Besides these different catalysts, we must mention a class perhaps even more interesting, that of the nitrogenous thiocompounds which can, besides acting as complete catalysts, furnish in a colloidal state all the sulphur necessary for vulcanization. Such, for example, is thio-carbanilide.

It can be seen that, from the chemical point of view, the number of compounds that can facilitate, hasten and improve vulcanization, is considerable. Thermochemical reasons, based on the necessity of their dissociation, show that the most interesting ones are those whose dissociation constants are greater than 1×10^4 .

Those which meet this last requirement are still rather numerous and we have been able to test the results of about a hundred of them. Bearing in mind the divisions which we have

¹Continued from THE INDIA RUBBER WORLD, November 1, 1918, page 80.

been using, we shall study some types belonging in each category.

Among the sulphydric accelerators we may reckon the resin oils, crude petroleum, waxes and ozokerite, certain bitumens, sodium, calcium, potassium in the form of paraffinated powder, tannin, and turpentine. These substances permit the rapid formation of sulphydric acid, they diminish a little the length of time necessary for curing and, above all, they allow the work to be done at a lower temperature. They must be classified according to whether the vulcanization takes place with dry heat, under pressure, by steam, or with hot air with or without pressure. A substance which behaves admirably in one case acts badly in another. A group of sulphydric accelerators corresponds to every source of heat. This remark is general and applies not only to accelerators, but also to vitalizers, and to vitalizing accelerators.

Sulphurous accelerators are found chiefly among the metallic oxides and peroxides. We have long known the action of litharge and of light magnesia, of which the accelerating qualities have been empirically demonstrated.

Iron oxide has similar qualities but it seems that they attain their maximum effect only in the presence of brown factices.

The oxide of manganese, especially Weldon's earth, is a good accelerator, but must be used in very small quantities, as it reacts on the caoutchouc, oxidizes it and makes it easy to break.

Black copper oxide cannot be used, but the red oxide is an excellent accelerator; a one per cent mixture easily vulcanizes in 30 minutes: but, unfortunately, this oxide gives a green color to the gum.

Peroxide of zinc, peroxide of magnesium, peroxide of sodium, the alkaline carbonates and persulphates and the plumbates, in quantities of 0.5 to 0.2 per cent, are good sulphurous accelerators.

The same thing can be said of the mixture of chlorate of barium and vanadium salts, but all these substances must be used in very small quantities, with great precaution and, as far as possible, in the presence of sulphydric accelerators, such as resins or lanolin. Their use shortens the time necessary, for vulcanization and allows lowering the temperature for the reaction.

The importance of these has greatly diminished since the discovery of vitalizing accelerators by using which both reactions can be obtained at the same time, without risking injury to the quality of the manufactured product.

Certain substances which are also classed among the accelerators can give both the sulphurous and the sulphydric reaction; they are those containing easily decomposable hydroxides. Certain alcohols, such as amyl alcohol, glycerine, terpineol, most of the phenols, particularly the diphenols, have these qualities. They accelerate vulcanization, but as their dissociation takes place only at a rather high temperature, no lowering of the heat during curing is possible.

We can include in this class also several alkaline oxides, such as sodium, potassium and barium hydrate, of which the accelerating action has long been known. The rapidity with which alkaline-reclaimed rubbers vulcanize is due to the presence of traces of sodium which acts to accelerate cure.

As a real vitalizer we can mention hardly anything but cyanhydric acid or the alkaline cyanides. The best is the cyanide of ammonium (CNNH_4), but it can be used only in the presence of sulphide of carbon. The reaction takes place according to the following equation:

The substance behaves under these conditions as an accelerating sulphydric vitalizer.

The addition of the vitalizer (mixture of cyanide of ammonium and of sulphide of carbon saturated with sulphur) is made when the mixture of the caoutchouc and charges is finished,

and the incorporation is insured by mixing on cold rolls to prevent too rapid evaporation of the sulphide of carbon. One can slacken this evaporation to a certain extent by adding tetrachloride of carbon to the sulphide, part for part. On account of their poisonous qualities, the use of cyanides cannot be recommended.

The sulphydric accelerating vitalizers are the most numerous and, practically, the easiest to use. Theoretically, every organic base, all amines and all imines can, under certain conditions, give the reaction of vitalization and of sulphydric acceleration. Such is the case of aniline, one of the first substances used as an accelerating vitalizer. The reaction is rather complex. In the presence of sulphur the benzene ring is broken up, forming a molecule of sulphocyanic acid, a molecule of sulphydric acid, two molecules of acetylene and one molecule of sulphide of carbon, at about 140 degrees C. The equation is:

In the class of the imines we can mention as giving very good results, piperidine or imino pentane:

The reaction again takes place by the breaking up of the ring, forming acetylene, sulphocyanic acid and sulphydric acid. The equation is:

A mixture composed of plantation crêpe, 60 parts; oxide of zinc, 33 parts; sulphur, 6 parts, and piperidine, 1 part, gives, under three atmospheres, a well-vulcanized product in 40 minutes and the following physical constants:

Breaking strength per square millimeter.....	1.905 grams
Elongation at break.....	.59
Permanent elongation.....	1.08

In order to obtain a perfect result it is necessary to add the piperidine to the sulphur before making the mixture. The crêpe and the oxide of zinc are uniformly mixed and the steam shut off from the rolls before the mixture of sulphur and of piperidine is added. The mixture must be allowed to rest 24 hours before being cured.

Paraphenylene diamine, aldehyde ammonia, sodium amide, benzylamine, naphthylene diamine, and all quaternary ammonium bases behave in the same way. Among these substances it is best to choose, as being the most energetic, those which can furnish most sulphydric acid and most sulphocyanic acid.

From this explanation it seems that the more atoms of nitrogen an aminated or imined compound substance has, the greater will be its energy as a vitalizer. This is not always true, for, besides the nitrogen, the atoms of carbon and of hydrogen necessary to form the active bodies, sulphydric acid and sulphocyanic acid, will often be lacking. One way of remedying this defect is to condense the amines with the aldehydes.

The type of this formation is the combination of formaldehyde with ammonia, which produces successively three accelerating vitalizers.

1. Trimethylene triamine.

Trimethylene triamine, which reacting with sulphur, gives

which is a perfect sulphydric accelerating vitalizer, since it leaves no residuary products.

2. Pentamethylene tetramine,

which, reacting with sulphur, gives:

3. Hexamethylene tetramine,

which, reacting with sulphur, gives:

Hexamethylene tetramine gives, in vulcanization, absolutely remarkable results from the point of view of time as well as of increase of breaking strength.

A mixture composed of plantation crêpe, 60 parts; oxide of zinc, 34 parts; sulphur, 5 parts, and hexamethylene tetramine, 1 part, under three atmospheres of pressure, gives, in 50 minutes, a perfectly vulcanized caoutchouc, of which the physical constants are as follows:

Breaking strength per square millimeter..... 3.170 grams
Elongation at break..... 7
Permanent elongation..... 1.095

In the condensation of the amines and the imines with the aldehydes we condense an aldehyde of the fat series with an amine or imine of the aromatic series and vice versa.

The products of the addition of sulphide of carbon with certain bases and certain amines also give very good vitalizers. Among these we can mention the products of addition of the sulphide of carbon to dimethylamine with the $\beta\beta$ dimethyl, and methyl trimethylene imine with the different cobaltamines. These last substances are vitalizers of the first rank.

In this class of vitalizers we must place the sulphurated derivatives of urea, such as sulphourea, which, with sulphide of carbon, gives very good results:

Dithiocarbonic acid,

which, heated with sulphur, gives the reaction:

The products of dinitrification of the amines act as complete accelerating vitalizers, their oxygen together with the sulphur producing sulphurous acid. The type is the parantroso dimethylaniline, an intermediary product well known in the manufacture of coloring substances.

With sulphur, the reaction is as follows:

Quinoline, oxyquinoline and their salts must be classed in the same group, as they act in the same way.

Most of the nitrated compounds obtained in the immense series of coloring matters, such as Bismarck brown or paranitraniline, are capable of acting as accelerating vitalizers.

It can be seen, therefore, that the number of substances which can be used as catalyzers in the vulcanization of caoutchouc is considerable, but a judicious choice must be made, taking into consideration the conditions of temperature which cannot be exceeded.

A very wide choice of catalyzers is open to manufacturers, and among these different kinds they will be able to find the compounds they need, whatever may be the physical conditions of vulcanization, dry heat or open-steam heat to accelerate its speed, while considerably increasing the breaking strength of the caoutchouc.

NEW JERSEY CHEMICAL SOCIETY.

THE January meeting of the New Jersey Chemical Society was held January 13, in Newark, New Jersey. Rubber was the topic of the evening.

"Catalysts in the Manufacture of Rubber Goods (A Story of Accelerators)" was presented by George D. Kratz of Cuyahoga Falls, Ohio.

Mr. Kratz briefly reviewed the methods of obtaining plantation rubber from latex and the resulting loss in resins, sugars and proteins with impairment of the vulcanizing qualities of the rubber product.

"Some American Substitutes for Rubber," by Dr. Frederick Dannert, of Newark, New Jersey, covered the story of rubber manufacture with special reference to national self-containedness of the continental United States as regards crude rubber.

The meeting closed with remarks by H. O. Chute, of New York City, on the patent situation with respect to organic vulcanization accelerators.

THE CARBON BLACK SITUATION.

During the last half dozen years carbon black has become very important to the rubber trade, especially in the manufacture of automobile tires. Its annual production in the United States, derived entirely from natural gas, is placed at about 36,000,000 pounds. Formerly the larger portion of carbon black was used in the manufacture of printing ink; now, however, the rubber industry uses the larger part.

The United States Fuel Administration has recently appealed to the patriotism of the manufacturers of carbon black in the important West Virginia areas to help in the conservation of natural gas, the supply of which is growing scarcer. This appeal has been met in a liberal spirit of cooperation and with pecuniary sacrifices on the part of the manufacturers.

In this connection it should be noted that the largest producer of carbon black has already moved one large plant from West Virginia to Louisiana; has closed down a second, and will relocate the remainder outside the state. The gas thus saved will be distributed to various communities for fuel purposes. Certain of the West Virginia plants, however, will be run at full capacity till November first of this year.

The removal of the carbon black industry to sections remote from the manufacturing centers where it is used will operate to raise its price through increased freight on both the packing and the material.

REMOVAL OF AUTOMOBILE PROHIBITION IN STRAITS SETTLEMENTS.

The proclamation of May 16, 1917, which prohibited the importation into Straits Settlements and the Federated Malay States of automobiles, parts and accessories thereof, has been revoked, according to a cablegram of December 9 from the American Consul General at Singapore.

What the Rubber Chemists Are Doing.

INVESTIGATIONS OF THE VULCANIZATION PROCESS.¹

ACCELERATORS.

INSPECTION of the following tabulated results will show that some compounds, especially the basic, or such as are transformed at the vulcanizing temperature into bases, cause strong acceleration. Other compounds have no influence, while the acid compounds show distinctly a retarding influence.

INFLUENCE OF VARIOUS INORGANIC COMPOUNDS ON THE VELOCITY OF VULCANIZATION (VAN HEURN).

Extra addition of one per cent.	Vulcanization Coefficient.	
None	3.11	3.16
Magnesium oxide	6.90	6.80
Ammonium carbonate	5.85	5.20
Barium hydroxide	4.86	5.05
Sodium sulphide	4.86	4.93
Litharge	4.65	4.35
Sodium bicarbonate	4.51	4.66
Ammonium phosphate	3.86	4.29
Magnesium carbonate		3.98
Sodium bisulphite	3.39	3.91
Ammonium sulphate		3.34
Ammonium oxalate	3.12	2.86
Ammonium chloride	2.77	3.08
Zinc oxide	2.75	2.70
Ammonium borate	2.57	2.65
Ammonium nitrate	2.28	2.65
Potassium bisulphate	1.93	2.46

Of much greater influence is the action of organic accelerators as can be seen in the following table, which relates to vulcanizations according to the "standard method" in the oil bath.

INFLUENCE OF ORGANIC COMPOUNDS ON THE VELOCITY OF VULCANIZATION (VAN HEURN).

Extra addition of $\frac{1}{4}$ of 1 per cent.	Vulcanization Coefficient.	
None	2.46	2.31
Accelerator	8.04	7.90
Vulcacite	7.80	7.69
Piperidine	7.00	6.95

Accelerene is the trade name of a product consisting of paratriso dimethylaniline, which is often sold containing a great many impurities. Vulcacite seems to be a condensation product from acetaldehyde and ammonia, according to researches made at the Institute.

It is remarkable that this acceleration is not identical for all species of rubber and it seems as if the combining with sulphur is less accelerated for highly viscous kinds than for those of low viscosity. One would be likely to conclude this from Van Rossum's observations in the following table:

VULCANIZATION COEFFICIENTS FOR VARIOUS RUBBERS ON ADDING THE SAME QUANTITY OF ACCELERENE.

Number of sample	54T	30	26T	98T	163T
Viscosity number	30	42	73	102	
Vulcanization coefficients with standard method (cured 1½ hours at 147° C. without addition)	2.3	3.1	4.3	4.7	
Vulcanization coefficients af. 1½ of 1%	1.9	1.9	1.5	2.1	
ter. 3 minutes' cure at 147° C. with accelerene	3.1	3.0	2.55	2.3	
	3.6	3.6	2.7	2.9	
	4.2	4.4	3.1	3.3	

The above data suggest important aspects for technical application. Before general conclusions can be drawn, further data will be required.

Another point worth notice, confirmed by the Institute, is that Kerbosch-Schadt rubber, prepared by evaporating the latex, possesses a high velocity of vulcanization, especially important in connection with the low viscosity. It is undoubted that this high velocity must be ascribed to serum compounds. It is further evident that there is no reason to give preference to natural caissons above artificial ones, when one desires to make "stiff" goods, and only for those will the addition be of value.

PREVIOUS HEATING OF RAW RUBBER AND THE VULCANIZATION COEFFICIENT.

Experiments by Van Heurn demonstrated that one can increase the velocity of vulcanization considerably and thus improve the mechanical properties, by heating *Hevea* crêpe for four hours in a current of carbon dioxide at 130 degrees C. If the heating is continued beyond four hours the mechanical properties again decline, approaching normal. How far the change observed on heating in carbon dioxide is due to the influence of that gas and whether the same result may be obtained on heating in another indifferent gas, will be determined by future experiments.

PLASTICIZING AND THE MECHANICAL PROPERTIES OF VULCANIZED RUBBER.

Continued plasticizing causes the diminishing of the breaking load and the elongation at break. When plasticizing takes place during periods within those of ordinary practice such influence is not noticeable. The Institute has unpublished tests showing that on energetically plasticizing, but not to such an extent that the velocity of vulcanization diminishes, the course of the curve is not altered, but its end point is shifted. Possibly this fact may be attributable to air, imprisoned during plasticizing, which does not wholly escape during vulcanization. The course of the curve is practically independent of the degree of plasticizing.

TIME OF CURE AND THE MECHANICAL PROPERTIES.

The point investigated was whether a rubber with a low viscosity can yield on prolonged vulcanization as good a product as one with a high viscosity. The answer is affirmative.

BREAKING LOAD AND ELONGATION AT BREAK WITH INCREASING TIME OF VULCANIZATION.

Tests were made with blanket crêpe, viscosity 46; *Hevea* crêpe, viscosity 63; and *Hevea* crêpe, viscosity 70. The curing periods extended from one hour to three, varying by intervals of one-quarter hour, except that the 1½-hour interval was omitted. The results of the tests showed that a weaker product, by prolonged vulcanization, can yield as strong a product as a strong rubber, without the danger of overvulcanization. It is concluded that when the conditions of vulcanizing differ from the standard method only in time of cure, the vulcanization coefficient remains a measure of the mechanical properties.

INFLUENCE OF TEMPERATURE AND QUANTITY OF ADDED SULPHUR ON THE MECHANICAL PROPERTIES.

Completely normal stress-strain diagrams were obtained for rubbers vulcanized at 139.2 degrees C. (that is, nine degrees lower than the chosen "standard temperature"), by vulcanizing for two, three, four, and five hours, respectively. This is not the case when more or less sulphur than the standard quantity of 7½ parts is added to 92½ parts of rubber. For example, with 12½ parts of sulphur to 87½ parts of rubber a much greater stress is required for a certain elongation than is necessary for a "normally" vulcanized rubber. This condition is noticeable with ten of sulphur to 90 of rubber. With less than 7½ parts the reverse is observed. The influence of excess sulphur confirms the conclusion arrived at for catalysts, namely, that a greater rapidity of vulcanization causes, under similar circumstances, a stiffer rubber than would be expected from the vulcanization coefficient.

MISCELLANEOUS FACTORS AND THE MECHANICAL PROPERTIES OF VULCANIZED RUBBER.

No exceptions have been met with at the Institute in which the elongation curve did not practically confirm expectation of theory regarding the correlation of viscosity and vulcanization,

¹Continued from THE INDIA RUBBER WORLD, January 1, 1919, page 196.

and of that existing between this coefficient and the situation of the curve of elongation.

The addition of chemically indifferent solid fillers has little or no influence on the velocity of vulcanization but does affect the mechanical properties. The elongation at break and breaking load decline and the rubber becomes stiffer as indicated by its elongation curve. The addition of soft fillers markedly reduces the breaking strength and elongation at break. This unfavorable effect was demonstrated by the presence of ten per cent of paraffine in a test compound.

THE ACTION OF ACCELERATORS ON THE MECHANICAL PROPERTIES OF VULCANIZED RUBBER.

Rubber vulcanized with powerful accelerators becomes "stiffer," and has less elongation at break than ought to be the case with the vulcanization attained. In other words it does not show a "normal" curve with relation to its vulcanization coefficient. In the case of vulcanization by the use of $\frac{1}{2}$ of one per cent of "accelerene" showing vulcanization coefficient 4.4, the curve occupied about the position of the normal one for a vulcanization coefficient of 7.

The end point of the curve is situated much higher than would be the case with a "normal" curve similarly located. Also the points of break for normal curves with high vulcanization coefficients are situated very far apart, while for rubbers vulcanized under accelerating conditions they all lie about equally high. From this it follows that rubber vulcanized with an accelerator can be stretched much farther without breaking than that vulcanized under ordinary conditions. With the former, brittleness occurs only with a much higher vulcanization coefficient and after reaching a greater degree of stiffness than with the latter. Therefore, whenever accelerators can be used a saving of steam will result and a product be obtained which will withstand greater elongation.

It is remarkable that rubbers with low viscosity are more accelerated in their vulcanization by similar quantities of accelerator than those of a high viscosity. For this reason their mechanical properties deviate more from the normal than those of highly viscous rubbers; consequently the action of accelerators is of higher importance for rubbers of low viscosity.

Addition of artificial accelerators under controllable conditions is preferable to intentionally leaving in the rubber natural catalysts, the nature and quantity of which are unknown. According to the opinion of the Institute, no danger exists of the oxidation of normally treated plantation rubber, packed and stored judiciously, even when stored for long periods.

Van Rossem hints at the possibility of greatly reducing the variability of plantation rubbers by careful adjustment of the addition of artificial accelerators with respect to the degree of viscosity of the rubber. Care is cautioned here because the question of proportion of accelerator desirable demands close and accurate study.

Regarding the possibility of unfavorable influence of accelerators in producing "after-vulcanization," it is said that such influence will probably be least for accelerators decomposable at the temperature of vulcanization, such as "accelerene" for example. The Institute advances the opinion that after-treatment of the vulcanized product with retarding catalysts, such as sulphur dioxide, can become a means of counteracting the harmful influence of after-vulcanization.

VULCANIZATION COEFFICIENT AS A MEASURE FOR THE MECHANICAL PROPERTIES.

With the standard vulcanization of first latex rubbers, the vulcanization coefficient gave an excellent indication of the mechanical properties. With a definite vulcanization coefficient known, the average course and the end point of the elongation curve could be calculated by using the Schopper machine.

Comparison of the elongation diagrams of vulcanizations dif-

fering from the standard method showed that the vulcanization coefficient offers a general indication of the probable course of the elongation curve, but that this is not the case with rubbers containing more than the usual quantities of artificial catalysts. Other factors influence the situation of the end point of the curve.

PRE, UNDER, OVER AND AFTER-VULCANIZATION.

In order to determine when a rubber may be pronounced well-vulcanized it is necessary to investigate the resulting properties produced from the inception of the process till it has advanced too far.

When rubber is heated only a short time with sulphur an alteration takes place which may be considered as the beginning of vulcanization. The resulting product may still be completely dissolved in the usual solvents for rubber. In this case the rubber is termed pre-vulcanized. Van Heurn has shown that this prevulcanization is noticeable at ordinary temperature, for after three months the viscosity of a mixture of 92½ parts of crepe and 7½ parts of sulphur appeared to be raised considerably more than could be explained from the recovery of the plasticized rubber. Prevulcanization was more marked for a mixture of sulphur, litharge, and magnesia. It is difficult to judge whether any sulphur is combined during this prevulcanizing; however, the impression is to that effect.

Prevulcanization merges into undervulcanization. The latter designation indicates that the product of vulcanization has become insoluble though still retaining plastic properties reminding one of raw rubber. It should be noticed that undervulcanization is often evident by porosity of the product, developed by steam bubbles in the rubber on blowing off the steam pressure.

Overvulcanization results in brittleness. Van Heurn points out that it is incorrect to think that where the breaking load attains a maximum, the best vulcanization exists. In practice overvulcanization will be assuredly prevented by not exceeding a vulcanization coefficient of 3.5 at the utmost.

After-vulcanization takes place in vulcanized rubber stored at ordinary temperature. The increase of combined sulphur is trifling, but at temperatures higher than normal, or when exposed to light, it becomes considerable. A well-vulcanized rubber in which only sulphur is present should possess a vulcanization coefficient of 2 to 4. It is not yet settled how far this result may be altered by the use of fillers and accelerators.

ALTERATION OF PROPERTIES DURING VULCANIZATION.

There exists a gradual change in the mechanical properties when passing from prevulcanization to overvulcanization. A similar continuity of change is observable on the transformation of overvulcanized rubber into ebonite. The quantity of combined sulphur also increases continuously coincident with a regular decline of the adhesiveness and solubility. Doubtless this continuity of changes also includes the other properties and applies to both hot and cold vulcanization.

THE NATURE OF MOTTILING OF VULCANIZED PARA RUBBER.

A paper by H. Runkel in "Gummi-Zeitung," 1916, page 144, is abstracted as follows in the "Journal of the Society of Chemical Industry," October 15, 1918, page 595A:

The sample examined was free from substitute and yielded only about 3 per cent ash. The lightest patches contained twice as much free sulphur as the darkest. The formation of the patches is explained as follows: After vulcanization the sulphur which has not combined chemically with the rubber passes, on cooling, into the amorphous or the rhombohedral form, except at the surface, where the octahedral crystals quickly separate. Sulphur wanders from the interior of the sample to the surface, and the sample "sulphurs up." At the same time, however, there occurs conversion of the less stable into the more stable form within the sample, the rubber acting as a solvent, and the sulphur wanders from certain parts of the solution and accumulates round other centers.

New Machines and Appliances.

THE MORRIS AUTOMATIC HEEL-TRIMMING MACHINE.

IN the accompanying illustration may be seen a novel heel-trimming machine that is practically automatic in operation. A rubber heel that has just been trimmed is about to fall into the delivery trough, while an untrimmed heel is shown in the position of being fed to the trimmer. When the heel is advanced to a certain point by the operator the machine takes hold of it and automatically completes the trimming operation.

THE MORRIS HEEL-TRIMMER.

Special cutters are provided on this machine, the upper one having a tapered cutting edge so that either tapered or straight-side heels may be trimmed in the same machine. Integral with the lower cutter is a small circular ridge, extending at right angles to the cutting edge, for the purpose of supporting the heel as the overflow is being removed. A special guard is fastened to the frame of the machine and extends outwardly under the upper cutter, effectively covering the cutting edge, protecting the heel and allowing only the overflow to be removed.

An adjustable guide that is attached to the table enables the operator to move the heels into the machine in rapid succession. An inclined trough conveys the trimmed heels by gravity to boxes provided for the purpose. (T. W. Morris, 3304 Warren avenue, Chicago, Ill.)

SEWING-MACHINE FOR BALLOON FABRIC.

Sewing-machines are necessary in the production of both airplanes and balloons, but there is so much more sewing to be done in the manufacture of even the smallest type of balloon that a special sewing machine was perfected in order that balloon production in the United States might be facilitated during the war.

This machine is known as the Singer No. 113 w 110, front view of which is here shown. It makes two lines of lock-stitching simultaneously and the work is accomplished rapidly, each of the two needles being capable of a speed of up to 2,500 stitches per minute. When it is remembered that in the envelope of even some of the smaller balloons there are about 400 pieces of rubberized fabric to be sewed, the great advantage of a high-speed machine is apparent.

Before the seams are stitched the edges of the sections are cemented. The arm of this machine being 30 inches long, a large number of gores can be attached with cement and then sewed at one time. As the feed must be sufficiently powerful to handle long lengths of rubberized fabric, the machine is equipped with additional feeding mechanism including two feeding rolls which are located at the back of the twin needles. This auxiliary feed pulls the work while it is being stitched so that much of the burden of feeding heavy and bunched fabrics is taken from the regular feed, the entire feeding mechanism working in unison.

As already stated, this machine makes two lines of lock-stitching, there being one needle thread and one bobbin thread for each line of stitching, the lock of the threads being located within the thickness of the rubberized fabric. This true lock-stitch passes

the strictest government tests. When the covering strip of fabric is cemented over the stitched seams of the balloon, the upper and under threads of the lock-stitch lie so snugly under the strip that no air pockets are formed. When air pockets are formed a leakage of hydrogen gas from the balloon follows.

The illustration shows the machine equipped with individual electric motor which is the most satisfactory form of drive. The

MACHINE FOR STITCHING BALLOONS.

outfit, moreover, is portable, being mounted on casters to facilitate moving the equipment from place to place as desired. (The Singer Manufacturing Co., Elizabethport, New Jersey.)

A NEW RETREADING EQUIPMENT.

Retreading continues to be a popular expedient for prolonging tire mileage and particularly so at the present time when

tire prices are high. That marked improvement is being made in the mechanical equipment for doing this work, is shown in the accompanying illustration of a new type of retreading vulcanizer. This is known as type E retreading equipment. This outfit will retread tires from 2½ to 5 inches and consists of two ribbed

TIRE-RETREADING VULCANIZER.

tread cavities, 2½ to 4-inch and 4½ to 5-inch, and a plain tread reducing shell for the 3½ to 4-inch cavity which will cure 2½ to 3-inch tires. It is made in 1/3 circle, can be heated by gas or gasoline and includes steam gage, water gage, safety valve and steel bands. This is a self-contained outfit. No boiler is required. (The Akron Rubber Mold & Machine Co., Akron, Ohio.)

POWER SAW FOR CUTTING SOLID TIRE BASES.

A novel application of the power hack-saw principle is shown by the accompanying illustration of a machine especially designed for cutting steel rims of solid tires. It is intended for use in service stations where worn-out tires are removed and new ones substituted on the wheel.

Solid truck tires are made on steel bases and forced on the wheel-rim by hydraulic pressure. In time, the wheel-rim and tire-base become firmly united and it is necessary to cut the steel base in order to remove the tire.

The wheel is clamped to a frame that is raised or lowered by worm-gearings operated by hand-power. The machine cuts on the draw stroke and the saw-frame is lifted on the return stroke by a compression oil lift-pump. A gage is provided to stop the

SOLID-TIRE-BASE CUTTING SAW.

cutting when the steel base has been severed. The saw-frame is adjustable for blades from 12 to 24 inches and will cut bases up to 16 inches wide. The machine may be driven by belt power or direct-connected motor. (W. Robertson Machine & Foundry Co., Buffalo, New York.)

MACHINERY PATENTS.

APPLYING BALATA TO FABRIC WITHOUT SOLVENT.

FABRICS may be simultaneously coated with balata on both sides by this method, and without the use of solvents. The accompanying drawing is intended to illustrate only the coating device, which in this instance conveniently comprises the top roll of a three-roll calender especially adapted for this purpose.

The balata stock is warmed up in the usual manner and banked above and below the fabric *A* as it passes between rolls *B* and *C*, that are excessively heated by steam. The impregnated fabric passes upwardly between the middle and upper, or cooling, roll *D*, and around the latter to the wind-up roller.

The cooling roll *D* is chambered for internal water cooling, while water jets sprayed from pipe *E*, arranged parallel with the roll, effectively cool the exterior surface of the cylinder. Trough *F* serves to carry off the water, and a rubber scraper attached to the inner edge of the trough removes the water from the roll and deflects it into the trough. (Lucien Abel François, Paris, France. United States patent No. 1,285,105.)

BALATA CALENDER.

SOAPSTONE-BRUSH.

By the use of this hand device, powdered soapstone may be applied to the surface of rubber stock without creating clouds of dust in the operation.

IMPROVED SOAPSTONE-BRUSH.

It comprises a container body, the bottom of which supports the bristles of the brush, and the top of which is a flexible diaphragm. The soapstone is delivered to the brush portion of the device by pneumatic pressure which is set up within the device by the hand of the operator grasping the brush-handle.

Connected to the diaphragm are means for breaking up any lumps of soapstone caked within the container body, as the diaphragm top is reciprocated by the user. The soapstone is deposited in the center of the brush and, by the movements of the operator's arm, is distributed over the surface to be dusted. (Mark A. Replogle, assignor to The Goodyear Tire & Rubber Co., both of Akron, Ohio. United States patent No. 1,281,660.)

New Goods and Specialties.

A COMBINATION TOBACCO-CONTAINER.

THE demand for a container for tobacco that will keep it away from moisture, and at the same time, one that will keep conveniently near the tobacco the papers, matches, etc., without which it is useless to the cigarette smoker, has resulted in "The Makings," of which an illustration is shown herewith. It consists of a pouch of waterproof rubberized khaki fabric attached to a nickel-plated top. This top, by an ingenious hinged arrangement, can be drawn away from the pouch sufficiently to get at the tobacco within. The top itself has a match-striker on one side and contains a tiny drawer or box in which matches and cigarette papers may be kept. When the container is to be put into the pouch, the match-box slides back into place and the top adjusts itself over the container-frame. The whole is neat, compact, and convenient, and is very good-looking. It is made from excellent materials and the idea is well executed. (The Scoban Co., Inc., New York City.)

"THE MAKINGS."

RUBBER IN THE MODERN HOSPITAL.

The application of rubber in the modern hospital is well-known, but not all of the uses to which it is put are familiar to the man in the street. Rubber tires and rubber-tired casters contribute much to the comfort of patients in a hospital and the accompanying illustrations show some developments along this line. The sectional view of the "Duckrub" tire illustrates how the canvas strips are inserted so that most of the wear is thrown on the edges. The other sectional view shows the round tread clincher type of rubber-tired wheel used on hospital beds, food cars, tray and dressing carriages, stretchers, etc. The tires are renewable. The caster below is of the swivel type. It is also rubber-tired and is used on hospital food cars, dressing carriages, stretchers, and different kinds of trucks, etc. The wheel illustrated in both sectional and perspective views is known as the solid-web rubber-

"DUCKRUB" TIRE.

RUBBER-TIRED CASTER.

CLINCHER TYPE HOSPITAL WHEEL.

SOLID-WEB RUBBER-TIRED WHEEL.

tired hospital wheel. It is used on hospital beds, operating tables, and other kinds of rolling equipment. These casters and wheels are made in the unfinished metal, black japan, or aluminum bronze finish to match the furniture. (Jarvis & Jarvis, Palmer, Mass.)

"RUSCO" RUBBER CORD TO RELIEVE AIRPLANE SHOCKS.

The demands of the airplane for dependable shock-absorbers have led to many expedients, and devices employing rubber are numerous. One of the newest is a cord made of strands of Pará rubber thread covered with cotton yarn. It is used to take up the shock of hard landings on airplanes. (The Russell Manufacturing Co., 349 Broadway, New York City.)

"DARCROID" SHEET PACKING.

A new kind of sheet packing combines the advantages of the old-fashioned rubber kind and the long-wearing asbestos type. It resists heat, acids, brine, ammonia, gas, and alkali, and at the same time is strong and durable. (Dominion Asbestos and Rubber Corp., 154 Nassau street, New York City.)

BEARD SOFTENER.

SHAVING-BRUSH ATTACHMENT.

The latest device to assist the man who shaves himself is an attachment for the shaving-brush which can be used with facility and satisfaction. It consists of a rubber disk with small projections that perform the function of a beard-softener. Spring arms and clamps provide means of attaching it to any brush, and a hinged construction where the arms join the clamp make the attachment adjustable to any convenient position. This device was recently patented in the United States of America. (James Smith, Jr., 66 Rose street, Phillipsburg, New Jersey.)

A WRINGER FOR MANY PURPOSES.

A wringer that combines the latest modern requirements of such a device as adapted for use in woolen and worsted mills, bleacheries, tanneries, and other similar industries, is pictured

THE "EXCELSIOR" WRINGER.

here. It is made with rolls in one diameter only, 10½ inches, and is driven by a tight-and-loose pulley. It can be attached to dyetubs when desired. The rolls are made of the best-quality rubber. (American Wringer Co., Woonsocket, R. I.)

THE EDITOR'S BOOK TABLE.

THE PREPARATION AND VULCANIZATION OF PLANTATION PARA RUBBER. By R. J. Eaton, J. Grantlun and F. W. Day. Kuala Lumpur, Federated Malay States, 1918. (Paper covers, 398 pages, illustrated. Price \$1 Straits Settlements. Equivalent to 56.7 cents United States currency.)

THIS volume embodies the results of the exhaustive series of scientific investigations conducted by the authors under Mr. L. Lewton-Brain, director of the department of Agriculture of the Federated Malay States. The researches are reported in a series of twenty-seven sections or chapters.

The results described under the section dealing with the scientific aspects of the problem have been published previously in the "Journal of the Society of Chemical Industry" and the "Agricultural Bulletin," Federated Malay States, but are rearranged in the present bulletin and a large number of experiments have been added. So far as they have been previously published these researches have been presented to the readers of THE INDIA RUBBER WORLD in the form of lengthy abstracts. It is of interest to rubber chemists to learn that the full report of the investigations is now available. The authors have appended to their report a reference list of 57 items covering the literature of crude rubber investigations from the plantation factory and chemical points of view.

INDIA RUBBER. BY H. P. STEVENS, M. A., Ph. D., F. I. C., Society of Chemical Industry, Central House, 47 Finsburg Square, London, E. C. 2.

This is a reprint from the "Reports of the Progress of Applied Chemistry," Volume II, 1917, of the Chapter entitled "India Rubber," etc., being an outline review of published researches dealing mostly with the preparation of plantation rubber, under the following topics: "Statistics of the world's output of crude rubber for the past four years," "Preparation of Plantation Rubber," "Non-caoutchouc Constituents of Rubber Latex," "Viscosity of Rubber Solutions," "Theory of Vulcanization and the State of Cure," "Accelerators," "Vulcanization." Copious references are given to the original researches.

TIRE REPAIRING AND VULCANIZING. BY HENRY H. TUFFORD. William Hood Dunwoody Industrial Institute, Minneapolis, Minnesota. (Cloth, octavo, 98 pages, illustrated.)

When the training of United States Army men in tire-repair work was started by the Minneapolis Tire Dealers' Association and Dunwoody Institute, the need of a special handbook for the purpose was felt and the present volume was prepared to meet that need. It covers the various problems which come before the tire-repair man and is, therefore, a comprehensive, yet concise, treatise giving the best practice on the different repair jobs, describing the necessary tools and equipment, also devoting considerable space to accounting, costs and business methods. The chapters on retreads and cutting and building cord tires, particularly, are of very timely interest.

NEW TRADE PUBLICATIONS.

THE BELMONT PACKING & RUBBER CO., PHILADELPHIA, PENNSYLVANIA, is sending out "General Catalog No. 5." This was formerly the Clement Rostin Co., but the corporation has adopted "Belmont" as both brand and company name. The catalog gives an extensive list of rubber, asbestos, metal, flax and hemp packings, fully described and excellently illustrated both in entirety and in section. Sheet and wick packings and steam hose are also cataloged.

* * *

AMONG HOUSE-ORNS OR FACTORY PUBLICATIONS "THE RUBBER Leaf" stands out prominently for typographical appearance and variety of contents. It is "published monthly by McGraw men for McGraw men," otherwise, the employees of the McGraw Tire & Rubber Co., East Palestine, Ohio. Well-edited, excellently illustrated, it certainly is a model publication of its kind and one

which commands perusal by all McGraw employees, men and women as well.

* * *

BULLETIN No. 333 of THE LINK-BELT CO., CHICAGO, ILLINOIS, is devoted to equipment for the handling and preparation of coal at the mine. Like all the publications of this company this 88-page pamphlet is crowded with excellent half-tones, well-drawn plans and diagrams, and succinct reading matter pertinent to the main subject. It must be of large value to coal miners, and is certainly of more than usual interest to the general reader.

* * *

SYMPTOMS OF POISONING BY AND ANTIDOTES FOR POISONOUS organic accelerators used in rubber work have been reprinted by permission of the American Chemical Society as a chart for use by factory superintendents. Copies can be obtained by addressing Dr. L. E. Weber, 729 Boylston street, Boston, Massachusetts. The data given will be found in THE INDIA RUBBER WORLD, issue of November 1, 1918.

HOLIDAY GREETINGS.

THE rubber and allied trades, with their usual generosity and cordiality, have sent THE INDIA RUBBER WORLD renewed expressions of good will and appreciation during the recent holidays. In return, this publication takes the opportunity to extend its thanks and to assure these friends in the trade that it cordially reciprocates their good wishes for progress and success in the new year which appears to offer such splendid opportunities in every line of business.

CALENDARS.

Elmer E. East, manager of Acme Belting Co., belting, packing, tires and tubes, mechanicals, and carriage cloth; also of United & Globe Rubber Manufacturing Cos., mechanical rubber goods, Chicago, Illinois, sends out an art calendar bearing a reproduction in color of C. D. Williams' painting, "The Angel of the Battlefields," representing the composite spirit of woman typified by a feminine figure in white, surrounded by soldiers of the Allied nations paying her tribute. The color scheme is blue and white.

General Electric Co., manufacturer of all kinds of electrical machinery and apparatus, Schenectady, New York, is represented by a large hanger calendar so constructed that one of its three sets of leaves may be thrown away every four months. Each page bears the current, the preceding, and the succeeding month. Above the calendar figures on each page is a representation of some particular machine or apparatus manufactured by the concern. The calendar combines yellow, red, and white as its color scheme.

The Wellman-Seaver-Morgan Co., engineer and manufacturer of rubber machinery, Akron, Ohio, distributes a hanger calendar so arranged that it is reversible after six months. Above the calendar on each page is an illustration of some one of its various specialties. The calendar is printed in pale yellow and black on white.

F. E. Myers & Bro., manufacturers of all kinds of pumps for both hand and power operation, pump accessories, etc., Ashland, Ohio, duplicates their usual calendar featuring the styles of pumps they manufacture, but adds at the top very good reproductions of photographs of the proprietors, F. E. and P. A. Myers, who are the executive head, and the manager and producer of the concern, respectively.

The Pierce Co., manufacturer of "Vorite," a rubber substitute, East Rochester, New York, issues a large calendar with an especially clear date pad with black and white figures. Above is a sepia reproduction of the company's factory.

New Jersey Rubber Co., manufacturer of all kinds of reclaimed rubber, Lambertville, New Jersey, provides a pad for the "Handy" calendar stand.

H. T. West Co., Inc., dealing in oils, gums, and waxes, Bos-

ton, Massachusetts, sends out a panel calendar in two tones of green, decorated with a reproduction of the poem, "The Trees," by Christopher Morley in "Collier's Weekly," and illustrations featuring the poplar, the oak, and the pine, mentioned in the verses.

Edison Lamp Works of General Electric Co., manufacturer of "Mazda" electric lamps, etc., issues a long panel calendar bearing a reproduction of one of Maxfield Parrish's paintings for the company—"The Spirit of Night." The colors are blue, purple, yellow and orange, while the calendar is blue on gray.

The Pioneer Asphalt Co., Lawrenceville, Illinois, manufacturer of "M. R." hydrocarbon, contributes a calendar and memorandum pads for a desk calendar frame, accompanied by a card of greeting.

SOUVENIRS.

Morse Chain Co., Ithaca, New York, manufacturer of silent chains, sends out a leather-bound diary, featuring its products.

H. Muehlstein & Co., dealers in scrap rubber, New York City, is represented by a silk-lined leather bill-fold with the recipient's name engraved in gold on the outside and their own on the inside. Space is provided for an identification card under a celluloid shield, as well as the usual pocket for folded bills.

John Royle & Sons, manufacturers of rubber-working machinery, Paterson, New Jersey, distributes a gilt-stamped leather-bound diary, describing their products and provided with geographical maps.

Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, through its New York office, sends out a leather-bound diary featuring its products and containing maps.

JUDICIAL DECISIONS.

A MERICAN CHICLE CO. v. UNITED STATES.—United States Court of Customs Appeals, November 26, 1918.

The merchandise in this case consists of chicle, which was assessed for duty under the provisions of paragraph 36 of the Tariff Act of 1913, which provides for chicle "refined or advanced in value by drying, straining, or any other process or treatment whatever beyond that essential to the proper packing," as the chicle in question had been shipped from Mexico to Canada, and there ground and dried before being imported to the United States. The protestants claim that it should have been assessed at the smaller duty of 15 cents a pound as "chicle, crude." The Board of General Appraisers sustained the assessment as made, and the importers appealed.

The United States Court of Customs Appeals affirmed the decision of the Board of General Appraisers. (Treasury Decisions, Volume 35, No. 25, December 19, 1918.)

HARDMAN TIRE & RUBBER CO. vs. STANDARD VULCANITE PEN CO.—Supreme Court, Appellate Division, First Department.

Appeal dismissed with \$10 costs. (New York Supplement, Volume 172, page 895.)

LIFE PRESERVER SUIT COMPANY vs. NATIONAL LIFE PRESERVER COMPANY.—Circuit Court of Appeals, Second Circuit, May 10th, 1918.

The National Life Preserver Company owned the Youngren patent on a life preserver suit which was intended to give both buoyancy and warmth to the wearer.

The Life Preserver Suit Company was organized by Keviczky who took over the exclusive sales of the National. Part of the contract was that six months after the contract date the Life Preserver people had the option of taking an exclusive license to manufacture the suits, for which they were to pay a royalty and furnish a suitable bond to guarantee payment thereof. At the expiration of the six months, notice was given that they desired to take the manufacturing license. Within the 10-day period, however, they requested an extension of thirty days because of difficulty in getting the necessary bond.

The directors and president of the National company refused to give the desired extension and no bond was ever executed.

The National people were about to make other arrangements inconsistent with that contract and the Life Preserver people brought action in the District Court to prevent them. That case was decided in the favor of the National people and was appealed. The decision was reversed and the case remanded. (Federal Reporter, Volume 252, page 139.)

CUSTOMS APPRAISER'S DECISIONS.

RAINCOATS—CHIEF VALUE.—Protest of F. B. Vandegraft & Co., New York City. The only question to be determined was whether the raincoats are in chief value of wool or in chief value of cotton. The goods were classified under paragraph 291 Act of 1913, as articles of wearing apparel in chief value of wool, at 35 per cent ad valorem, and are claimed to be dutiable under paragraph 256 as articles of wearing apparel in chief value of cotton, at 30 per cent ad valorem.

The controversy arises regarding the proper method to be used to determine the component material of chief value. On the evidence of the analyst, all the items were held dutiable at 30 per cent ad valorem, under paragraph 256, Act of 1913. Judgment was in favor of the protestants, sustaining the protests accordingly, and in favor of the Government overruling the protests as to the other merchandise and claims. (Treasury Decisions, Volume 35, No. 25, December 19, 1918.)

WEBBINGS.—Merchandise classified as webbings, composed in chief value of artificial silk and rubber, at 60 per cent ad valorem under paragraph 319, Tariff Act of 1913, is claimed dutiable as cotton fabrics with fast edges under paragraph 262, against which assessment Edwin Horrax (New York), protested. It was found that these webbings are made of cotton, artificial silk, and rubber, the cotton being of greater value than the separate or combined values of the artificial silk and rubber. They were held dutiable at 25 per cent under paragraph 262. (Treasury Decisions, Volume 36, No. 1, January 2, 1919.)

GUTTA SIAK.—A protest of the Rubber Association of America is sustained in a decision just rendered by the Board of United States General Appraisers, permitting the free entry of certain gutta siak. Duty was assessed at the rate of 15 per cent ad valorem under paragraph 385 of the Tariff Act of 1913. Judge Hay sustains a protest for free entry under paragraph 502.

ADJUDICATED PATENTS. THE UNITED STATES.

I. T. S. RUBBER COMPANY vs. PANTHER RUBBER MANUFACTURING COMPANY.—United States District Court, Massachusetts.

The Tufford patent, No. 1,177,833, for a mold for making rubber heels, claim 11 of which specified a mold chamber having one wall convex and the other concave, held invalid, and further held not infringed, if deemed limited to the particular structure shown and described. (Federal Reporter, Volume 253, page 63.)

NEW YORK AUTO SHOWS.

The passenger car exhibition will take place February 1-8, and the commercial car exhibition February 10-15, 1919. Both shows are under the auspices of the National Automobile Dealers' Association, and members of the Motor and Accessory Manufacturers' Association have decided to exhibit this season. So large are both sections of the show to be that no single building in New York is adequate to hold either. Madison Square Garden and the Sixty-ninth Regiment Armory together will house the passenger-car section during the first week, and the second week the commercial vehicle section, including motor trucks, delivery wagons, tractors, etc., will occupy both of the show buildings.

A big meeting of the National Automobile Dealers' Association, at which prominent men will speak, is scheduled for February 5, in the form of a noon-day luncheon.

The Obituary Record.

PIONEER IN THE PNEUMATIC TIRE INDUSTRY.

HARVEY DU CROS, through whose enterprise and business acumen Dunlop's invention of the pneumatic tire was developed, died at his residence, Dalkey, County Dublin, Ireland, on the twenty-first day of December, 1918, at the age of 72.

HARVEY DU CROS, J.P., M.P.

It is related that in 1888 when J. B. Dunlop a Belfast veterinary surgeon, devised two air-filled tires for his son's bicycle, Mr. du Cros, who, like his six sons, was an enthusiastic cyclist, saw the possibilities of the pneumatic tire and formed a company with a capital stock of £15,000 to exploit the invention. Though at first the "doughnut" tire was ridiculed it soon gained favor and displaced the "bone shakers," as the solid tire tricycles were afterwards called. The motor industry provided a much wider

scope for the pneumatic tire, and under the management of Mr. du Cros the name of the Dunlop tires became familiar on six continents.

Mr. du Cros was president of the Dunlop Pneumatic Tyre Co., Limited, an office which he held even after a shock rendered him physically disabled, though mentally as strong as ever, and since his retirement, a few years ago, he has always been available in an advisory capacity.

Mr. du Cros was born in Dublin, Ireland, in 1846, being descended from an old Huguenot family which settled in that country in 1702. He was a keen sportsman, and in his younger days excelled in boxing, rowing, gymnastics and cycling. He was a member of Parliament from 1906 to 1908.

Of his six sons, Sir Arthur du Cros has been for several years managing director of the Dunlop Rubber Co., Limited, Birmingham, England, and another son, Harvey du Cros, Junior, is joint managing director of The Austin Motor Co., Limited, Northfield, Birmingham, England.

A history of Mr. Harvey du Cros' connection with the Dunlop Pneumatic Tyre Co., Limited, was given at some length in THE INDIA RUBBER WORLD, December 1, 1909.

CHEMICAL EDITOR AND WRITER.

Raxley F. Weber, of the General Laboratories of the United States Rubber Co., New York City, died on November 9, 1918, after a lingering illness. Mr. Weber graduated from Cornell University in 1903, after which he taught chemistry for some years in the St. Louis high schools. His connection with the rubber industry commenced as research chemist with the Rubber Regenerating Co., Naugatuck, Connecticut, at the beginning of the year 1912.

His research work was thorough and resulted in some distinct advances in the art of reclaiming.

Failure in health led to his taking a six months' leave of absence in 1914, after which he joined the staff of the general laboratories of the United States Rubber Co., New York City, where his work was chiefly bibliographical. He was abstractor for the section on pigments, resins, varnishes and india rubber for the abstract journal of the American Chemical Society from January, 1913, until a separate section was formed for rubber and allied substances, of which he took charge as assistant editor in December, 1916.

At the United States Rubber Co.'s general laboratories he started the technical abstract bulletin that is circulated within the United States Rubber System and edited it with distinction, carrying on the work with a courage during his fight for health in the last part of his life that was an inspiration to his associates. He was peculiarly fitted for this sort of work and enjoyed its successful development under his hands.

Warm-hearted, whole-souled, and unselfish, he endeared himself to all of his associates and will be sorely missed by all who knew him.

RAXLEY F. WEBER.

THE PAINT INDUSTRY LOSES A LEADER.

Raymond Watson Evans, vice-president and general manager of The Eagle-Picher Lead Co., Chicago, Illinois, died suddenly in New York City on Thursday, the sixteenth day of January, 1919, following an attack of acute indigestion.

RAYMOND W. EVANS.

Mr. Evans was born at Covington, Kentucky, on April 8, 1871. After graduating from high school he started his business career in the dry goods business in Missouri. While in Colorado for his health, his attention was directed to the opportunities offered by the lead business and he accepted a position as salesman in the Far West territory for the Picher Lead Co. in 1894. One year later he became secretary and treasurer of the company. When the Eagle White Lead Co. was absorbed by the Picher company in 1916, Mr. Evans became vice-president and manager of sales.

Mr. Evans loved his business and his home, was a tireless worker and a modest, kind, universally liked man. To his ability the success of the company is largely due.

Mr. Evans leaves his widow, Alberta Wetzel Evans, a daughter, Eugenia, his mother, three sisters, and his brother, S. Marshall Evans, the latter being the second vice-president of the Eagle-Picher Lead Co.

News of the American Rubber Industry.

RUBBER INDUSTRY HAS FAVORABLE OUTLOOK.

COL. SAMUEL P. COLT, in a timely interview in the "New York Journal of Commerce," makes the following points:

The past year has been prosperous, the business of the United States Rubber Co. exceeding \$200,000,000; profits, without considering the Federal income tax, satisfactory; inventories, due to the sudden ending of the war, very large; goods in stock under the inflated prices for materials constitute a danger; outlook for 1919 excellent; wages to be maintained as far as possible until cost of living diminishes; no increase in cost of crude rubber anticipated; freights believed to continue high; shipping to return to normal before long; great increase in tire business looked for; tire prices to be reduced only when cost of cotton and other commodities is materially reduced.

NEW JERSEY ZINC CO. HAS SEVEN-STORY BUILDING.

The New Jersey Zinc Co. has moved into its new seven-story building at 160 Front street, New York City. The company manufactures lithopone and well-known brands of American and French process zinc oxides used by

In the construction of this modern edifice zinc materials were largely used. On entering the building, a carved horse's head, the company's trade-mark, may be seen over the doors. The entrance and vestibule doors are constructed of sheet zinc rolled on wood. Zinc-plated door checks, frames and window sashes are used. Flushings, gutters and all other outside work are made of rolled zinc, and the knobs and locks throughout are of zinc plate. The side walls of the elevators

NEW JERSEY ZINC CO.'S NEW HOME.

vators are of zinc construction, while their doors and bell plates are zinc-coated, giving a rich satin finish. The grilles for the registers were first stamped and then zinc-plated. The lighting and hardware fixtures are likewise zinc-plated. Paint, enamel and tints include zinc oxide and lithopone, the latter being contained in even the window shades.

THE S. A. E. WINTER MEETING.

The winter meeting of the Society of Automotive Engineers to be held at 29 West 39th street, New York City, February 4-6, 1919, will be devoted to the reconstruction problems facing the automotive industry. The annual banquet, to be held February 6, at the Hotel Astor, will take the form of a Victory dinner. About 2,000 members and guests are expected to attend. Prominent men have been invited to discuss the domestic and foreign future of the industry. The speakers at the professional sessions will be men in close touch with the automotive war program, who will now be permitted to give freely of the immense store of information collected by the Government. The report of the Standards Committee of the society will include important proposed standards.

DIVIDENDS.

The Corn Products Refining Co., New York City, has declared its quarterly dividend of $1\frac{3}{4}$ per cent. on preferred stock, payable January 15 on stock of record January 6, 1919.

The Eagle-Picher Lead Co., Chicago, Illinois, declared its regular quarterly dividend of $1\frac{1}{2}$ per cent on its preferred stock, payable January 15 on stock of record January 6, 1919.

The Empire Rubber & Tire Co., Trenton, New Jersey, has declared from its surplus earnings a quarterly dividend of $1\frac{3}{4}$ per cent on its preferred stock, payable January 10 on stock of record January 1, 1919.

The Goodyear Tire & Rubber Co., Akron, Ohio, declared its regular quarterly dividend of 2 per cent on its second preferred stock, payable February 1 to stock of record January 15, 1919.

The Hood Rubber Co., Watertown, Massachusetts, declared its regular quarterly dividend of $1\frac{3}{4}$ per cent on its preferred stock, payable February 1 to stock of record January 20, 1919.

The Lynn Rubber Manufacturing Co., Lynn, Massachusetts, paid a 7 per cent annual dividend on January 2, 1919.

The Manufactured Rubber Co., Philadelphia, Pennsylvania, declared a dividend of 3 per cent on its preferred stock, payable January 27, 1919. This concern paid 6 per cent annual dividends from 1908 to 1912, but discontinued them before the end of 1913.

The Na-Peer Tire Co., Akron, Ohio, declared a dividend of $1\frac{1}{2}$ per cent on its common stock and a semi-annual dividend of $3\frac{1}{2}$ per cent on its preferred stock, both of record December 31, 1918.

The New Jersey Zinc Co., New York City, has declared a quarterly dividend of 4 per cent, payable February 10 on stock of record January 31, 1919.

The Sterling Tire Corp., Rutherford, New Jersey, declared its regular quarterly dividends of 4 per cent per annum on its common stock and 7 per cent per annum on its preferred stock for the period of three months ended December 31, 1918, payable January 15, 1919.

The United States Rubber Co., New York City, has declared from its net profits a quarterly dividend of 2 per cent on its first preferred stock, payable January 28 on stock of record January 15, 1919.

The Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pennsylvania, has declared its regular quarterly dividend of $1\frac{3}{4}$ per cent on preferred and common stock, payable January 15 and 31, 1919, respectively, on stock of record December 31, 1918.

AMERICAN WEBBING MANUFACTURING EXPORT CORP.

A group of the largest manufacturers of webbing of all kinds in the United States, having an aggregate invested capital of nearly \$9,000,000, has organized the American Webbing Manufacturing Export Corp. to promote and handle foreign business. Some of the larger companies concerned are: Everlastik, Inc.; American Mills Co.; Ansonia O. & C. Co.; Conant, Houghton & Co.; George S. Colton Elastic Web Co., and the Sanford Narrow Fabric Co.

W. B. Spencer, general manager of Everlastik, Inc., is president of the new organization. Mr. Chambers, of the American Mills Co., is vice-president; F. L. Brigham, Conant, Houghton & Co., treasurer; C. R. Richmond, George S. Colton Elastic Web Co., secretary; Mr. Judd, foreign department of the Guarantee Trust Co. of New York, general manager; L. R. Brown, Everlastik, Inc., merchandise manager. The advisory committee consists of Charles Stretch, F. L. Brigham, A. F. Terrill and Mr. Sutcliffe.

JOHN W. THOMAS.

JOHN W. THOMAS, chairman of the solid tire division of the War Service Committee of the Rubber Industry of the U. S. A., is a native son of the Buckeye State, having been born in Tallmadge, Ohio, in 1880. He spent his boyhood days on a

J. W. THOMAS.

farm, entering Buchtel Academy at the age of 17, and completing his education at Buchtel College, from which he graduated in 1904 a degree of Ph. B. Shortly after graduation he entered the laboratory of The B. F. Goodrich Co., Akron, Ohio, where he spent three years in research and experimental work. In January, 1908, he joined the Akron, Ohio, organization of the Firestone Tire & Rubber Co. and installed its laboratory, where he served as chemist for two years, going thence to the manufacturing department, serving an apprenticeship in one tire manufacturing unit after another, and becoming manager of one of the departments. In 1911 he was appointed superintendent of the factory, a position he still holds, and in 1916 he was elected a member of the board of directors of this company. Mr. Thomas makes his home in Akron, is married and has four children, two boys and two girls. He is a member of the Congregational Church, of the Lone Star Fraternity, the Portage Country Club, Akron City Club, Rotary Club, Ohio Society of New York, Society of Automotive Engineers, Knights of Pythias, and the Akron Chamber of Commerce, of which last organization he is a director.

PERSONAL MENTION.

Prominent among the younger men identified with the rubber industry, and one who has won recognition by his versatile ability and invariable courteousness, is W. H. Dickerson. He was assistant to the secretary of The Rubber Association when, upon recommendation of the Committee on Rubber and Kindred

W. H. DICKERSON.

Products, he went to the War Trade Board and the Bureau of Imports at Washington as trade expert in charge of details relating to the inspection and allocation of rubber and kindred products.

Having acquired in the service of the Government a successful record and a large acquaintance among leading rubber men, Mr. Dickerson will continue in the rubber business as a member of the office staff of Meyer & Brown, dealers in crude rubber, 347 Madison avenue, New York City.

Charles R. Sargent has been appointed general manager of Stresen-Reuter & Hancock, Inc., Chicago, Illinois, manufacturer, importer and exporter of colors, minerals, chemicals and oils. Mr. Sargent will take charge of the Chicago office, but will spend part of his time in Cleveland, where he has been branch manager.

Frederick W. Dunbar resigned on December 31, 1918, as American agent, attorney-in-fact, and manager of the New York City office of Aldens' Successors, Limited, London, England. He is succeeded by Thomas A. Maguire and Alvah H. Brown as joint agents and attorneys-in-fact.

R. A. Hoover, special representative of The Pioneer Asphalt Co., Lawrenceville, Illinois, was in New York City last month.

L. P. MacNamara, of MacNamara & Wadbrook, Inc., New York City, has recently returned from a three weeks' trip to Hot Springs, Arizona, where he has extensive ranching interests.

E. E. Wadbrook, of the above company, has just returned from

Piedmont, North Carolina, where he participated in the golf tournament.

M. L. Heminway, whose efficient work as secretary of the War Service Committee of the Rubber Industry will be favorably remembered by the whole trade, has been appointed assistant manager of the Motor & Accessories Manufacturers' Association, 33 West 42d street, New York City.

Joseph P. Ripley, who has been in charge of the government sales of The Fisk Rubber Co., Chicopee Falls, Massachusetts, in Washington during the last year, as well as manager of the Baltimore district of the company, has been promoted to manager of the central district, with headquarters in Chicago. Mr. Ripley entered the employ of the Fisk company in January, 1909, as salesman in the western New York district. He was subsequently appointed manager of the Baltimore branch in 1910 and Baltimore district manager in 1915. The central district includes 20 direct branches of the Fisk company and comprises the states of Illinois and Indiana and parts of Wisconsin, Iowa and Kentucky.

J. P. RIPLEY.

Frederick B. Peterson, the former director of the Bureau of Imports, War Trade Board, has become associated with Charles T. Wilson Co., Inc., crude rubber dealers, New York City.

Elmer E. Bast has been appointed Chicago representative of the United & Globe Rubber Manufacturing Co., manufacturers of mechanical rubber goods, Trenton, New Jersey, with headquarters at 173 North La Salle street, Chicago, Illinois.

A. M. Whaley has been appointed Southern sales manager for The General Tire & Rubber Co., Akron, Ohio, with headquarters at Atlanta, Georgia.

Thomas L. Moore has been appointed Southwestern district manager for The General Tire & Rubber Co., Akron, Ohio, with headquarters at Dallas, Texas.

B. F. Wulff has been appointed general sales manager for the International India Rubber Corp., manufacturer of "South Bend" tires, Indiana. Mr. Wulff was formerly sales manager for the Century-Plainfield Tire Co., Plainfield, New Jersey, and was before that with the Kelly-Springfield Tire Co., in Chicago.

Claude Platt, recently central district manager of The Fisk Rubber Co., Chicopee Falls, Massachusetts, has been promoted to the position of special representative, with offices at the Chicago branch, 2508 Michigan Boulevard, Chicago, Illinois. Mr. Platt's new duties will take him among the manufacturers of the country, handling special and contract sales of both pneumatic and solid tires. Mr. Platt became identified with the Fisk company in 1905, when he was appointed Cleveland salesman, and later became manager of that branch. In 1909 he was appointed manager of the Chicago, and four years later manager of the central district.

CLAUDE PLATT.

J. T. Mahon, general manager of the Henderson Rubber Co., Baltimore, Maryland, spent 10 days in the early part of January in New York City.

Thomas A. Maguire has been appointed manager of the New York City office of Aldens' Successors, Limited, London, England, at 290 Broadway, succeeding Frederick W. Dunbar, resigned. Mr. Maguire's connection with the New York house covers a period of two years. He was formerly with Edward Maurer Co., Inc., New York City.

TRADE NOTES.

The McGraw Tire & Rubber Co. of New York, Inc., has been dissolved and The McGraw Tire & Rubber Co., East Palestine, Ohio, has been authorized to do business in the State of New York. Its representative is G. A. Schumacher, 55 33d street, Brooklyn, New York.

The Everwear Rubber Co., Milwaukee, Wisconsin, has bought the plant and equipment of the Pettley Rubber Manufacturing Co., and will continue the manufacture of high-grade mechanical rubber goods and molded specialties. The officers of the company are: Andrew Steele, president; F. C. Bunde, vice-president, and George W. Kliegel, secretary and treasurer. L. M. Bickett is in charge of the factory.

The Newman Tire & Rubber Co., Inc., dealer and jobber in automobile tires and tubes, has removed its general offices and warehouse to 244-246 West 54th street, New York City, to which address all communications should be sent. Both retail and wholesale business will be conducted and the several retail stores of the organization will obtain their merchandise from this central distributing point.

The Keystone Tire & Rubber Co., New York City, has entered into a contract with the Perfection Tire & Rubber Co., Fort Madison, Iowa, by which the latter concern will manufacture Keystone tires and ship them direct to the stores controlled by the Keystone company in the Middle West. The contract is on a cost-plus basis, similar to others made by the company in the past.

L. H. Butcher Company, Inc., New York City, has placed on the market as a compounding ingredient, "Diatomite," a natural silicious mineral of 1.61 specific gravity, which is offered as a substitute for carbonate of magnesite.

R. M. Loewenthal & Co., Inc., dealer in scrap rubber, announces the removal of its New York office to the factory, 343 Babcock street, Buffalo, New York, to which all communications should be addressed. Its new department devoted to the rebuilding of scrap automobile tires has developed to such an extent that the handling of scrap tires as scrap will be discontinued for the present.

O'Connor & Haupt, Inc., 71 West 3d street, New York City, was recently incorporated at \$2,000, as noted in our issue of January 1, 1919, and will manufacture pure gum hydraulic hat bags for manufacturers of men's, women's and children's hats, deal in unvulcanized rubber and tire repair materials and fabrics, and do all kinds of vulcanizing.

The True-Fit Waterproof Co., Inc., New York City, has been dissolved under the laws of the State.

The International Toy Co., Eau Claire, Wisconsin, has recently been incorporated under the laws of the State of Maine, as noted elsewhere, with a capital of \$100,000, to manufacture toys of all kinds. One of the specialties will be children's express wagons with Gillette auto truck tires. The officers are: L. D. Pangborn, president and general manager; Dr. S. P. Woodward, vice-president; A. P. Hansen, secretary and treasurer. Dr. Woodward is also president and treasurer of the Gillette Rubber Co., Eau Claire and New York City, while Mr. Pangborn, who is an experienced toy designer, has been chief draftsman and designer in the mechanical department of the Gillette Rubber Co. at Eau Claire.

The membership of the Society of Automotive Engineers increased by 717 during the year just past.

Orders placed by the government on December 7 for \$1,000,000 worth of tires included contracts for the United States Tire Co., Kelly-Springfield Tire Co., The Fisk Rubber Co., Firestone Tire and Rubber Co., and The Goodyear Tire & Rubber Co.

The Mulconroy Co., Pittsburgh, Pennsylvania, manufacturer of metallic hose, couplings, etc., removes January 1 from 528 Fourth avenue to the four-story warehouse at 112 Market street, Pittsburgh.

The Beacon Falls Rubber Shoe Co., Beacon Falls, Connecticut, is endeavoring to obtain additional workers to fill the large number of orders for civilian goods which were delayed during the execution of government work, now concluded.

The American Chiclé Co., 19 West 44th street, New York City, has contracted for the erection of a one-story brick building, 51 by 131 feet, on the north side of Borden avenue, Long Island City, to be used as a storage warehouse in connection with its present plant located there.

COMPOSER AND MANUFACTURER.

THE NAME of Seneca G. Lewis has been brought into nationwide prominence lately, as that of a composer who has turned over the royalties of several popular compositions to the "New York Sun" Tobacco Fund for smokes for United States soldiers overseas.

Yet Mr. Lewis follows music, not as a profession, but as a pastime. He is a wide-awake, active business man, a natural organizer, a manager, and a rubber manufacturer.

He was born in Hartland, Michigan, and educated there and at Hillsdale College, Hillsdale, in the same state, graduating in 1889, after which he spent two years on a ranch in the "Wild West." On his return, he entered the employ of the Fletcher Hardware Co., Detroit, Michigan, and later became manager

SENECA G. LEWIS.

of the sporting goods department of that organization.

In 1900, at Detroit, in company with W. E. Metzger, he promoted and managed the first automobile show held in the United States, and continued in management of this enterprise until he accepted the position of sales manager of the Winchester Repeating Arms Co. in 1904.

While in Detroit he found time to cultivate his musical talent, and for a time it seemed probable that he would adopt this as his life work. But his final decision was for a business career. In 1910, a personal friend, Charles M. DuPuy, induced him to undertake the reorganization of the Pennsylvania Rubber Co., Jeannette, Pennsylvania, in which the DuPuy family was financially interested. Accomplishing this, he acted as general manager, a position affording him the opportunity of carrying out plans he had formulated long before, and so successful were these that he brought the company to its present prominence. In 1918 he was elected vice-president as well as general manager.

For several years he transcribed hardly a melody, but the entrance of the United States into the war inspired him to produce a number of patriotic compositions, a song, a march, and a one-step, and to dedicate the royalties to the benefit of the boys in khaki. It is his hope that the royalties may ultimately reach \$25,000, nearly half of that amount having already been contributed.

Mr. Lewis is a member of several Pittsburgh clubs and is also president of the Jeannette War Service Union, an association formed to assist, in any way which may be necessary, soldiers returning from military to civil life.

NEW INCORPORATIONS.

Anco Tire & Rubber Co., Inc., January 4, 1919 (New York), \$4,000.
C. A. Weldon, 591 7th street, Brooklyn, New York; S. Bernheim, 35 Nassau street; A. Hirsch, 847 Hunsontown avenue—both of New York City. To manufacture and deal in tires.
Capital Tire & Rubber Co., Inc., January 13, 1919 (New York), \$2,000.
C. A. Weldon, H. S. Hartstein, A. Hirsch—all of 35 Nassau street, New York City. To manufacture tires and rubber goods.
Carpenter Tire & Rubber Co., Inc., January 19, 1919 (New York), \$20,000.
H. S. Carpenter, 30 Bay View Road, Rockville Centre, L. F. Rudiger, 59 East 70th street, Lynbrook, Long Island, M. F. Hennessy, 165 Prospect Park West, Brooklyn—all in New York. To manufacture tires and rubber goods.

Chadbourne & Moore, Inc., December 31, 1918 (Massachusetts), \$400,000.
J. H. Chadbourne, 172 Lincoln street, Boston; W. W. Moore, 19 Summer street, Boston; J. H. Chadbourne, 106 Mt. Vernon street, Lowell—all in Massachusetts. Principal office, Boston, Massachusetts. To manufacture, buy, sell, and deal in all kinds of rubber and rubber goods.
H. J. Cohrs, F. S. Cohrs—both of 60 Smith street, Jamaica, I. Gilbert, 175 Schenectady avenue, Brooklyn—all in New York. To manufacture inner liners for auto and motor tires.
Continental Drug Co., February 23, 1918 (Delaware), authorized capital stock \$1,500,000.
C. L. Rumliger, M. M. Clancy, E. A. Armstrong—all of Wilmington, Delaware. Principal office with the Corporation Trust Co. of America, DuPont Building, Wilmington, Delaware. To manufacture import, export, and generally deal in rubber goods, etc., and acquire buildings, machinery, and equipment for the purpose.

Continental Drug Corp. (Delaware), authorized December 4, 1918 (Illinois), \$245,000.
R. C. Luby, agent, 825 Washington street, Alton, Illinois. To deal in rubber goods.
Eastern Waterproof Co., Inc., January 21, 1919 (New York), \$1,000.
M. Berman, 812 Suburban place, L. Berman, 910 Union avenue, M. Herman, 414 East 10th street—all of New York City. To manufacture raincoats, etc.

Elmira Tire Sales Station, Inc., January 16, 1919 (New York), \$2,000.
C. A. Weldon, A. Hirsch—all of 35 Nassau street, New York City. To sell tires.

E. R. S. Tire Co., Inc., January 2, 1919 (New York), \$600.
I. Gilbert, 175 Schenectady avenue, Brooklyn; R. C. Luby, agent, 825 Washington street, Alton, Illinois. To manufacture auto tires.
Graham Tire & Rubber Co., January 10, 1919 (Delaware), \$50,000.
F. W. L. and L. D. Graham—all of 3630 First avenue, Newark, New Jersey. Principal office with the Capital Trust Co. of Delaware, Dover, Delaware. To manufacture and sell pneumatic and solid tires and inner tubes, etc.

Loeb & Co., Inc., Alfred J. December 31, 1918 (New York), \$150,000.
A. L. Helwitz, 1651 East 23rd street, R. C. Klotzer, 121 Dresden street, J. Aronson, 962 East 10th street—all of Brooklyn, New York. To manufacture rubber boots and shoes.
International Toy Co., December 16, 1918 (Maine), \$100,000.
D. F. Drew, C. W. Hamilton, A. B. Farnham—all of Portland, Maine. Principal office Portland, Maine. To manufacture all kinds of toys and express wagons with Gillette safety auto truck tires.

Lion Tire & Rubber Co., Inc., December 30, 1918 (New York), \$1,500.
H. S. Hartstein, 350 Havemeyer street, C. A. Weldon, 591 7th street; M. Kitzay, 723 Monroe street—all of Brooklyn, New York.
Lod: Rubber Works, Inc., January 3, 1919 (New Jersey), \$50,000.
A. B. Hart, 2641 Westfield place, Jersey City, New York; M. Calvert, 60 South Maple avenue, Ridgewood; G. W. Parigot, Allendale avenue, Allendale—all of New Jersey. Principal office, Main street, Borough of Lodi, Bergen County; A. B. Calvert, agent, 100 West 42nd street, New York City. To manufacture and deal in rubber and rubber goods.

McNaulty Tire Co., Inc., January 6, 1919 (Delaware), \$10,000.
M. F. Franklin, L. H. Petzold, C. L. E. Peterson—all of 1919 Pennsylvania avenue, Philadelphia. To manufacture and deal in automobile tires and all accessories.

Midco Tire Co., Inc., January 23, 1919 (New York), \$25,000.
C. S. and S. J. Lindley, both of 260 Valentine Lane, Yonkers, New York; O. E. Drury, 1135 Commonwealth avenue, Boston, Massachusetts. To manufacture tires and rubber goods.

Newburgh Tire & Rubber Co., Inc., December 23, 1918 (New York), \$1,500.
H. S. Hartstein, 350 Havemeyer street, C. A. Weldon, 591 7th street, M. Kitzay, 723 Monroe street—all of Brooklyn, New York. To manufacture tires.

New Hide Manufacturing Co., January 4, 1919 (Delaware), \$100,000.
C. L. Rumliger, M. M. Clancy, O. B. Drew—all of Wilmington, Delaware. Principal office with the Corporation Trust Co. of America, DuPont Building, Wilmington, Delaware. To manufacture, and deal in leather, imitation leather, belting, etc.

New York Tire & Rubber Co., Inc., December 30, 1918 (New York), \$1,000.
H. S. Hartstein, 250 Havemeyer street; C. A. Weldon, 591 7th street; M. Kitzay, 723 Monroe street—all of Brooklyn, New York.
New York Rubber Tire Co., Inc., December 23, 1918 (New Jersey), \$150,000.
M. C. Overman, 250 West 54th street; C. A. Tausig, 220 Broadway; W. F. Lowther, 43 Cedar street—all of New York City. Principal office, 43 Hill street, New York City. To manufacture and deal in rubber goods, etc.

Panco Rubber Co., The, January 4, 1919 (Massachusetts), \$100,000.
F. Ellinghaus, 100 West 42nd street, New York City; R. Bernstein, 11 Homestead Road, Forest Hills; M. Marcus, 77 Homestead street, Rosbury—all in Massachusetts. Principal office, Chelsea, Massachusetts. To manufacture, buy, sell, and deal in rubber, rubber goods, and rubber substitutes.
Perfection Tire Upkeep, Inc., January 15, 1919 (New York), \$100,000.
M. E. Andre, 3799 Lake avenue; I. W. Phillips, 1919 Clifford avenue; J. Miller, 42 Sidney street—all of Rochester, New York. To manufacture, deal and lease tires.

Protective Raincoat Co., Inc., January 3, 1919 (New York), \$5,000.
Abraham and Eva LeHong, both of 170 North 10th street, New York City. To deal in rubberized apparel, etc.

Raleigh Tire & Rubber Co., Inc., January 4, 1919 (New York), \$2,000.
C. A. Weldon, 591 7th street, Brooklyn, New York; S. Bernheim, 35 Nassau street; A. Hirsch, 847 Hunsontown avenue—both of New York City. To manufacture and deal in tires.

Retrograde Corp., January 16, 1919 (New York), \$52,500.
M. W. McConnell, 229 West 52nd street, New York City; E. C. and E. M. Brannan, both of Chicago, Illinois. To repair tires.
Rex Tire Corp., Inc., January 10, 1919 (New York), \$90,000.
F. R. Hansell, I. C. Clow, J. A. MacPen—all of 417-419 Market street, Camden, New Jersey. Principal office, 417-419 Market street, Camden, New Jersey. To manufacture "ret" and generally deal in steel-corded leather treads for automobile tires of all kinds, etc.

Saturn Spring Tire Manufacturing Co., The, December 5, 1918 (Wisconsin), \$10,000.
M. C. Weiss, 809 Sycamore street, Milwaukee; L. S. Branson, 146 Wisconsin street, M. Rasmussen, 3404 Osborn Boulevard, both of Milwaukee, Wisconsin. Principal office, Racine, Wisconsin. To manufacture automobile and truck tires.

Saxet Tire & Rubber Co., Inc., December 23, 1918 (New York), \$2,000.
H. S. Hartstein, 350 Havemeyer street; C. A. Weldon, 591 7th street; M. Kitzay, 723 Monroe street—all of Brooklyn, New York. To manufacture tires.

Schenectady Tire & Rubber Co., Inc., January 20, 1919 (New York), \$3,000.
C. A. Weldon, H. S. Hartstein, A. Hirsch—all of 35 Nassau street, New York City. To manufacture tires.

Siegel Shoe Co., December 31, 1918 (New Jersey), \$100,000.
D. R. Siegel, M. Grossman, S. Hauman—all of Newark, New Jersey. Principal office, 786 Broad street, Newark, New Jersey. To purchase and sell boots, rubbers, etc.

Union Rubber Meter Co., Inc., December 23, 1918 (New York), H. W. Mater, 215 Mcubbin avenue; E. G. Turner, 214 West 110th street, both of New York City; I. F. Strudy, 520 54th street, Brooklyn, New York. To manufacture and sell rubber meters.
Union Standard Rubber Co., January 4, 1919 (Delaware), \$30,000.
S. S. Adams, Jr., G. J. Gray, R. A. Giacomini—all of Wilmington, Delaware. To manufacture and deal in all kinds of rubber and rubber goods.
United Tire Service & Supply Co., Inc., December 28, 1918 (New Jersey), \$100,000.
E. Windmiller, R. C. Gluck, H. Feder—all of 863 Bergen avenue, Jersey City, New Jersey. Principal office, 863 Bergen avenue, Jersey City, New Jersey. To manufacture and sell tires, carriages and vehicles of every description.

Tough Rubber Co., Inc., December 5, 1918 (Massachusetts), \$25,000.
A. Steinhilber, 12 Prospect street, J. W. and E. H. Myers, both of 282 Cohanett street—all of Taunton, Massachusetts. Principal office, 38 Treco street, Taunton, Massachusetts. To buy, sell, manufacture, and deal in all kinds of rubber and rubber goods.

Union Standard Rubber Co., January 4, 1919 (Delaware), \$30,000.
S. S. Adams, Jr., G. J. Gray, R. A. Giacomini—all of Wilmington, Delaware. To manufacture and deal in all kinds of rubber and rubber goods.
U. S. Levis, 6215 20th avenue, Brooklyn, New York; R. Itowitz, 29 Lewis street, M. Itowitz, 95 Cannon street—both of New York City. To manufacture and sell rubber goods and repair tires.

Universal Tire Repair Co., Inc., January 18, 1919 (New York), \$5,000.
S. A. Davison, Rockville Centre; E. G. Darmstadt, Hewlett; E. E. Blakeley, Lynbrook—all of New York City. To repair tires.

Victory Tire & Rubber Co., December 18, 1918 (New Jersey), \$300,000.
A. W. Britton, G. V. Reilly, L. H. Gunther—all of 65 Cedar street, New York City. Principal office, 15 Exchange Place, Jersey City, New Jersey. To purchase, sell, and deal in all kinds of rubber and rubber goods.
Watertown Tire & Rubber Co., Inc., January 10, 1919 (New York), \$50,000.
C. A. Weldon, 591 7th street, Brooklyn, New York; S. Bernheim, 35 Nassau street; A. Hirsch, 847 Hunsontown avenue—all of New York City. To manufacture tires and rubber goods.

Wilmington Tire & Rubber Co., Inc., January 10, 1919 (New York), \$25,000.
J. W. Weldon, 591 7th street, Brooklyn, New York; S. Bernheim, 35 Nassau street; A. Hirsch, 847 Hunsontown avenue—all of New York City. To manufacture tires and rubber goods.

THE MID-WEST RUBBER MANUFACTURERS' ASSOCIATION.

A number of rubber manufacturers of the Central Western States met on January 7, 1919, at Chicago and formed the Mid-West Rubber Manufacturers' Association. John W. Maguire, The Brunswick-Balke-Collender Co., was elected president. John T. Christie, Hawkeye Rubber Co., Des Moines, Iowa, was made vice-president, and Preston E. Roberts, Perfection Tire & Rubber Co., Fort Madison, Iowa, was chosen as secretary. H. V. Conradt, Kokomo Rubber Co., Kokomo, Indiana, is the treasurer.

The directors are: Marshall D. Wilbur, Palmer Tire & Rubber Co., St. Joseph, Missouri; M. P. Nicol, Ten Broeck Tire Co., Louisville, Kentucky; and C. Wright, Racine Auto Tire Co., Racine, Wisconsin.

Representatives of the following companies now constitute the membership: Johnstone Tire & Rubber Co., Laporte, Ind.; Century Rubber Works, Inland Rubber Co., Dryden Rubber Co., Featheredge Rubber Co., and The Brunswick-Balke-Collender Co., Chicago; Twin Tube & Rubber Co., Chicago Heights; Boone Tire & Rubber Co., Sycamore, Illinois; Wilson Tire & Rubber Co., Springfield, Illinois; Double Fabric Tire Co., Auburn, Indiana; Lion Tire & Rubber Corp., Lafayette, Indiana; Iowa City Tire & Rubber Co., Iowa City, Iowa; Hawkeye Tire & Rubber Co., Des Moines, Iowa; Perfection Tire & Rubber Co., Fort Madison, Iowa; Sioux City Tire & Manufacturing Co., Sioux City, Iowa; Racine Auto Tire Co., Racine, Wis.; Indiana Rubber & Insulated Wire Co., Jonesboro, Indiana; Kokomo Rubber Co., Kokomo, Indiana; Federal Rubber Manufacturing Co., Cudahy, Wisconsin; Ten Broeck Tire & Rubber Co., Louisville, Kentucky; Curtis Tire & Rubber Co., Muskegon, Michigan; Cupples Co., St. Louis, Missouri; Gillette Rubber Co., Eau Claire, Wisconsin; Mid-Continent Tire & Manufacturing Co., Wichita, Kansas; Kansas City Tire & Tube Co., Kansas City, Missouri; Palmer Tire & Rubber Co., St. Joseph, Missouri; Burdick Tire & Rubber Co., Noblesville, Indiana.

THE RUBBER TRADE IN OHIO.

By Our Special Correspondent.

THE Firestone Tire & Rubber Co., Akron, reports increasing business in its footwear sales. This branch of the business was started only a year and a half ago, but has grown rapidly. Fourteen new salesmen have recently been added to the force, which is now four times the original number. A convention for salesmen was held during the first week in January, the principal feature being a training school dealing with selling principles and policies. The total sales in the footwear department during 1918 amounted to \$2,216,000, as compared with \$715,000 in 1917. The present output of light footwear is 2,500 pairs daily, and several new lines have been added.

The Firestone Tire & Rubber Co., Akron, has paid to its employees since September 12, 1918, when it inaugurated its plan for group insurance, \$15,000. The amounts going to families and dependents of deceased employees ranged from \$500 to \$1,000, and included 26 cases where the deceased had been in the employ of the company longer than 30 days, while one had been employed more than eight years.

The Firestone Steel Products Co., Akron, manufacturer of solid and pneumatic tire rims and S. A. E. bands, has added three new representatives to its force: A. D. Droeger, manufacturers' representative; C. W. Flick, Eastern representative; J. C. Bailey, Western representative.

A band of 50 pieces has been organized among the employees of The B. F. Goodrich Co., Akron, under the direction of Clark Miller, former leader of the Eighth Regiment Ohio National Guards Band. The officers are: Edward Connelly, president; William Overholser, vice-president; and L. F. Riley, secretary.

The 25 per cent bonus recently paid employees of The B. F. Goodrich Co., Akron, throughout the country, amounted to \$2,000,000.

The Wellman-Seaver-Morgan Co., Cleveland, has opened a San Francisco office at 415-417 Rialto building, in charge of Norman S. Ross. The territory covered will include California, Nevada west of the 115th meridian, Lower California, and the counties of Josephine, Jackson and Klamath, Oregon.

Horace N. Trumbull has been appointed advertising manager of the Wellman-Seaver-Morgan Co., Cleveland. Mr. Trumbull has recently been discharged from the Engineers Officers' Training School at Camp A. A. Humphreys, Virginia.

The stockholders of The General Tire & Rubber Co., Akron, have approved action of the board of directors with reference to increasing the capital stock of the company from \$1,000,000 to \$2,500,000. The additional capitalization is for new buildings and machinery.

The following directors were elected: M. O'Neil, W. O'Neil, T. F. O'Neil, W. E. Fouse, G. F. Burkhardt, W. L. Beckley and J. A. Diebolt. The officers were reelected as follows: M. O'Neil, president; W. O'Neil, vice-president; Charles Herberich, treasurer, and W. E. Fouse, secretary.

The L. H. Butcher Co., Inc., dealers in colors, chemicals, minerals and industrial ores, 100 William street, New York City, have opened an office in the People's Savings and Trust building, Akron, in charge of George H. Jacobs, where a stock of standard materials will be carried.

G. P. Blackiston has been appointed head of the cooperative and advertising department of The American Rubber & Tire Co., Akron. He has been advertising manager of the Packard Electric Co., Central Steel Co., etc., and is an enthusiastic automobilist.

The Mohawk Rubber Co., Akron, recently recognized the efficiency of its salaried employees throughout its branches as well as in the home office, by a 10 per cent bonus.

The Goodyear Tire & Rubber Co., Akron, recently announced that the company will not follow the plan of many concerns and give bonuses, but will recognize deserving employees by a salary increase.

George Spalding in charge of the solid tire department of the Goodyear Tire & Rubber Co., Akron, was recently awarded a 20-year service pin.

Major William Ryan, the only Akron air ace, who served two years with the Australian Flying Corps overseas, has returned to the employ of The Goodyear Tire & Rubber Co., Akron, as an instructor in the factory school.

Lieutenant C. V. Newbold, former attorney of the accounting department of The Goodyear Tire & Rubber Co., Akron, was killed in the battle of Soissons. His widow has been given the Distinguished Service Medal awarded for gallant conduct.

The India Tire & Rubber Co., Akron, originally incorporated under the laws of the State of Ohio as "The India Rubber Company," on December 1, 1916, has now changed to the longer name. Its factory is at Mogadore, a suburb of Akron, where the company owns 19 acres of land with waterpower rights. The factory building proper is two stories high, with basement 60 by 232 feet, besides an "L" of the same height, 40 by 80 feet, of steel, brick and concrete construction. Until recently the concern has manufactured fabric tires, but it is now making cord tires.

The directors are: J. M. Alderfer, J. K. Williams, D. A. Grubb, Paul C. Searls, A. T. Kingsbury, J. W. Chamberlain, H. Lloyd Williams, C. C. Fonten, G. W. Santee, E. A. Armstrong and J. S. Fishburn. The company is capitalized at \$400,000 common stock and \$100,000 preferred, of which \$375,000 of the common stock has been sold at par.

The Republic Rubber Corp., Youngstown, has elected Harvey J. Woodard and Mark W. Roe vice-presidents, the former to have charge of sales and the latter to be in charge of the plant.

The Oak Rubber Co., Ravenna, has purchased a brick factory building three stories in height, 50 by 100 feet, with a floor space of 25,000 square feet. There are several smaller buildings on the site. New equipment is being installed for an increased production of toy balloons, the company's specialty.

The Victory Rubber Co., Springfield, has added four new men to its force. L. H. Cooke is to be in the capital financial department; Ira A. Stowe has been appointed district sales manager in Southern territory; E. D. Valentine has been placed in charge of installing new rubber-working machinery in the engineering department, and Frank X. Lothschuetz will cover the Ohio territory as a salesman.

The company recently completed a two-story building of brick and concrete, which is being used exclusively for pneumatic tire production. The new "Victor" cord tire will soon be ready for the trade. Preliminary tests are said to be very gratifying.

The company is to organize an export department which will include direct representation in Europe and South America.

The Premier Rubber & Insulation Co., Dayton, has increased its capitalization from \$100,000 to \$150,000 and has enlarged its factory floor space by the addition of a three-story factory. The concern makes insulation products of hard rubber, Bakelite,

Condesite or Premierite, the latter being one of its own specialties.

* * *

The K & W Rubber Co., Ashland, has removed its factory and general office to Delaware. A new factory building of modern brick construction has been erected, covering 30,000 square feet. The site covers about 13 acres of ground. In addition to "Maxotires," the company will manufacture other rubber goods, for which purpose suitable machinery and equipment is to be installed.

* * *

The Cincinnati Automotive Trade's Association, 654 Main street, Cincinnati, has elected the following officers: A. C. Mundew, president, Glouster Supply Co.; E. N. Stern, vice-president, C. & D. Auto Supply Co.; R. R. Woolley, treasurer, Buckeye Tire Repair Co.; Ralph R. Curl, secretary, H. W. Johns-Manville Co.; finance committee—J. W. Brumbaugh, I. J. Cooper Rubber Co.; W. W. Robertson, Miami Vulcanizing & Rubber Co.; G. A. Jackson, Dixie Vulcanizing Co. In addition to the officers the board of directors includes R. Herold, Herold Motor Car Co.; Paul Schneider, Auto Tire & Repair Co., and E. J. Leesman, Firestone Tire & Rubber Co.

* * *

The McGraw Tire & Rubber Co., East Palestine, has just completed plans for insuring its employees to the amount of more than \$1,000,000. The premiums will be paid by the company. Special features include automatic increase of the amount of each policy as the employee's time of service increases; a special disability clause whereby in case of permanent disability the amount of the policy will be paid in monthly instalments; the payment of the face value of the policy to the beneficiary at the death of the employee; and a conversion clause which enables the holder of the policy to continue the insurance after leaving the company's employ. The life insurance plan is augmented by a benefit association carried on by employees, insuring financial protection against unemployment, illness, or accident. Membership in this association also includes recreation privileges in the McGraw Club.

THE RUBBER TRADE IN MASSACHUSETTS.

By Our Regular Correspondent.

BUSINESS seems on the way to recovery from the slump which followed the signing of the armistice, and the prospects are for an early approach to normal. Tire manufacturers, who have been restricted to a percentage output, have increased their production. Boot and shoe manufacturers, most of whom are behind in deliveries, are pushing their mills to full tickets, while orders are being booked for next summer and fall delivery. Clothing men are perhaps less active than are manufacturers in some other lines. The makers of mechanicals report a fair trade with expectations of increase as the year progresses.

* * *

As a rule, the rubber goods manufacturers in this section are not only willing but anxious to return to their original positions the employees who enlisted, and who are now returning from the battle area. In many cases the manufacturers are really anxious to secure the services of these competent workers, for few, if any, of the rubber factories are oversupplied with experienced workmen.

* * *

An event of the month has been the Victory Shoe Style Show at Symphony Hall. This was a most pronounced success. It was timed to be held when the shoe buyers came to the Boston market, and a round-up of the leading hotels furnished a list of between 150 and 200 buyers, nearly every state in the Union being represented, as well as Canada and England. The show followed in general program the one held at the Copley Plaza Hotel last July, being under the same directorship, Robert J.

Walsh being manager. The floor of Symphony Hall was laid out so that exhibitors had spaces around the sides. On the stage was a beautiful floral arrangement, termed "The Garden of Styles," and from this was a flower-decorated runway on which the thirty or more chic and handsome models paraded, clad in becoming costumes of the coming spring and fall. Although these were simply accessory to the appropriate footwear worn, they enhanced greatly the attractiveness of the exhibits. At the back of the stage was a silvered screen on which was projected the name of the manufacturer whose shoes were being exhibited by the "model" at the moment. Band and orchestral music was furnished, and the capabilities of the great symphony organ were brought out by eminent organists. This was especially true during the afternoons, when, besides the organ recitals, moving pictures were projected on the screen, depicting the various processes of shoemaking, and views of the factories, where the exhibited samples of footwear were made. Naturally, most of the exhibits were those of shoes and leather, but there were a few representatives of the rubber trade.

The United States Rubber Co., New York City, exhibited its varied line of "Keds," a specially attractive kind of rubber-soled, cloth-upper shoes, in both high and low styles, and in white and a variety of colors. The booth was in charge of J. T. Cooper, of the Boston branch of the company.

The Hood Rubber Co., Watertown, showed its "Leisure" footwear, a high-class line of Oxfords and boots of fabric with rubber soles.

The Batterman Rubber Co., Framingham, exhibited its specialty "Toesans," footloths which are the exclusive production of this house. The Avon Sole Co., Avon, manufacturer of "Du-Flex" soles and heels, showed a fine variety of shoes equipped with these specialties.

The Foster Rubber Co. made a comprehensive exhibit of its great variety of "Catspaw" rubber heels.

So successful was this exhibition that the managers announce a repetition at Symphony Hall early next July during the usual summer influx of visiting buyers.

* * *

In 1916 the Boston Woven Hose & Rubber Co., Cambridge, inaugurated a plan to present to its older employees gold coins at New Year's. At that date 105 persons who had been in continuous service more than 10 years, were thus remembered. This year the number had increased to 190, who shared in the distribution at a meeting held at the plant on December 31. On account of the war savings campaign, the last two distributions have been in war savings stamps, the presentation being made by Mr. Fellows, factory manager. Addresses were made by George E. Hall, president and general manager, and by Henry B. Sprague, vice-president and treasurer. The latter claimed he was entitled to be called a veteran employee, having completed more than twenty years in the service of the company. At the meeting it was stated that eight employees had been with the company over thirty years, and four others twenty-five years.

* * *

A benefit plan has been put into effect by the Hood Rubber Co. at its factory in Watertown, by which employees, in case of sickness, will receive an allowance of from eight to twelve dollars a week, and in case of death, from \$200 to \$1,000. Any one who has been in the employ of the company for three months is eligible to the benefits, the lowest amounts being paid to those with such a term of service, while the highest go to those workers who have been employed five years or more. There is no cost to the employee. A curious fact is that an hour and a half after the plan went into effect a \$1,000 death benefit was paid. The plan affects about 7,500 employees, of whom approximately one-third are women.

William Jameson, superintendent of The Fisk Rubber Co., Chicopee Falls, has been elected president of the Board of Trade of that town.

The Social and Athletic Association of The Fisk Rubber Co., Chicopee Falls, has flooded its big park, thus making a skating rink, and has built a toboggan slide, which has in it an angle which will ensure exciting and exhilarating speed, and now the only thing necessary is freezing weather. Every employee's custom now is to consult the thermometer at least three times a day.

* * *

It may be remembered that the majority of the stock of the Boston Belting Co. and the Roxbury Carpet Co., whose factory adjoins the rubber mill, were purchased by Willett, Sears & Co., which organization later transferred its interests in these two corporations to certain banking interests in this city. William A. Gaston, prominent in financial, legal and political circles in this city, has been elected president of the two companies, and Henry B. Sprague, treasurer. The directors are Frederick E. Snow, Frank W. Knowlton, John C. Rice, Otis B. Prescott and William A. Gaston. It is reported that the business of these concerns will be pressed actively and will be divorced from the interests of Willett, Sears & Co., or any of their various enterprises. The Roxbury Carpet Co. has offices in the downtown district, but the business offices of the Boston Belting Co. will continue at the plant, 80 Elmwood street, Roxbury district. The new management proposes to push the business vigorously and to extend its trade.

* * *

The business of the Sterling Fountain Pen Co., which is owned and operated by the Davidson Rubber Co. of this city, is offered for sale by the latter. As may be remembered, the Davidson Rubber Co. has of late years reduced its items of production to a comparatively small number of specialties, preferring to manufacture in large lots rather than in great variety. The pen business does not fit in with this policy, neither does it go so well in a factory devoted mainly to soft rubber goods, while the distributing end is in the stationery instead of the drug trade. The Sterling Fountain Pen Co. was established in 1884, and has patents with several years to run.

* * *

James J. Rafferty, director of the Bureau of Commerce and Industry, Manila, Philippine Islands, is now in this country to explain the advantages of investments in a tropical country under the United States flag, rather than in countries under European governments. He advises rubber planting there, arguing that in any such emergency as that recently in the Federated Malay States, the American rubber industry would be free from domination by other governments. He called upon some of the larger rubber manufacturers here, explaining the peculiar advantages of raising rubber in our Far Eastern possessions.

* * *

William H. Moore, until recently assistant manager of the New England organization of The B. F. Goodrich Co., having been promoted to the position of manager of the Pittsburgh, Pennsylvania, branch of that company, was the guest of honor at a dinner given by his associates at the Copley Plaza Hotel, attended by 85 heads of departments and salesmen from the Boston headquarters and the branches at Worcester and Springfield, Massachusetts; Providence, Rhode Island; Manchester, New Hampshire; Burlington, Vermont, and Portland and Bangor, Maine, were present. Joseph J. Buckley, Boston manager of sales, in behalf of those present, tendered to Mr. Moore a handsome gold watch, chain, and charm in appreciation of him as a fellow worker. The dinner was supplemented by a theater party.

Mr. Moore entered the employ of the company nearly ten years ago, bringing to his new endeavors an extensive business experience. Determined to learn the business from the ground up, he worked first as a tire repairer, subsequently passing through other departments, absorbing practically their details, until he was advanced to the position he relinquishes to assume the more important one in Pittsburgh.

* * *

The old established firm of Chadbourne & Moore, manufacturers of elastic web at Chelsea, with offices at 179 Lincoln street, Boston, has been dissolved, and a corporation, known as Chadbourne & Moore, Inc., has been organized under the laws of Massachusetts, with a capital of \$400,000, which has taken over all the assets of the firm and will continue to carry on the business at the same Chelsea and Boston locations.

* * *

B. F. Chamberlin, organizer and former vice-president and general manager of the Walpole Shoe Supply Co., and later manager of the shoe supply department of the Revere Rubber Co., Chelsea, has taken over the business of that department, and will continue it with offices and stock rooms at 184 Summer street, Boston. Mr. Chamberlin organized the business in 1908, and successfully managed it as a branch of the Walpole Rubber Co. until 1914, when the latter company became financially embarrassed. The business was taken over by the Revere Rubber Co. and has been under Mr. Chamberlin's management up to the present. Besides other supplies for shoe manufacturers, he will continue to handle rubberized cloth and "Gem" insole duck and material.

* * *

At the meeting of the National Shoe Wholesalers' Association, held in Boston, January 9, 1919, George H. Mayo and Charles W. Barnes of the United States Rubber Co., explained the present rubber footwear situation and advised the wholesalers to send in their detailed orders as early as possible if they desired them completed in full. They told why: because workmen and workwomen could not be transferred from making one line of rubber footwear to another, some departments in the various factories were rushed to capacity and others running to part time on small tickets.

Robert L. Rice, sales manager of the Hood Rubber Co., Watertown, also addressed the meeting, and urged wholesalers to look closely after their tennis orders, as there was a likelihood of a greater demand than supply later in the season.

* * *

A. H. Elder, for many years connected with the Boston Belting Co., resigned from that company recently to accept a position on the sales force of the Electric Hose and Rubber Co., Wilmington, Delaware, and is representing that Company in New England with headquarters at 161 Devonshire St., Boston, Massachusetts.

* * *

George H. Hichborn, general manager of the United States Rubber Co., New York City, was one of the speakers at the thirty-third annual banquet of the Association of Railroad and Steamboat Agents at Young's Hotel, Boston, Saturday evening, January 11, 1919, at which about two hundred guests were present. Mr. Hichborn advocated the return of the railroads to private ownership.

* * *

The Boston Automobile Dealers' Association Show, to be held March 20-25, 1919, in Mechanics' Hall, Boston, will undoubtedly be a great success, as space is rapidly being allotted. The Motor & Accessories Manufacturers' Association will participate, and a large representation is expected.

THE RUBBER TRADE IN RHODE ISLAND.

By Our Regular Correspondent.

FOR the first time since the outbreak of the great world war in 1914, the beginning of the new year 1919 found a general shut-down among the rubber manufacturing establishments throughout Rhode Island. It was the first opportunity the mills had had for a complete overhauling and a thorough inventory. The Alice Mill and Millville plants of the Woonsocket Rubber Co., closed December 28 at noon and remained closed until Thursday, January 2. This shut-down gave a vacation to approximately 2,500 operators, 1,700 in the Alice Mill at Woonsocket and 800 in Millville. The National India Rubber Co. at Bristol and the Candee in New Haven were also closed during the same period. About 8,000 employees in all were affected.

James W. Franklin, superintendent of the footwear division at the factory of the National India Rubber Co., Bristol, was presented with a handsome electric lamp by the foremen and forewomen of that department as a Christmas remembrance. Isaac H. Gorman, foreman of the cutting department received a chair, and John Lavender, foreman in the footwear division, a shaving set.

Notices were posted at the factory of the National India Rubber Co., on January 15, announcing the following appointments: Edward I. Cooper, assistant superintendent of the footwear division; George E. Shaw, assistant superintendent of the wire division; Col. Andrew W. Anthony, foreman of the stitching department of the footwear division; John A. Wahlgren, assistant general sales manager of the wire division; and Lester K. Munroe, assistant treasurer.

* * *

On New Year's Eve, Harris Hall, Woonsocket, was the scene of a large gathering at the first annual concert and ball, under the auspices of the employees of the Alice mill, given for the benefit of the band. The hall was decorated with flags and bunting, and the band appeared for the first time in uniforms furnished by the corporation. A substantial sum was added to the band's fund.

* * *

Chief Justice Parkhurst of the Rhode Island Supreme Court has filed an important opinion of the court, during the past month, in the case of Eli Frank et al., receiver of the Dreadnought Tire & Rubber Co., against the Broadway Tire Co. of this city. Both sides took exceptions to decisions made by a justice of the Superior Court some time previously, in relation to a demurrer to a replication.

The main argument before the Supreme Court was on the question whether the receiver of a foreign corporation, the plaintiff corporation being engaged in business in Maryland, could maintain an action on a contract where the corporation had not complied with the statute requiring every foreign corporation not a Federal one to appoint a resident of this state as attorney upon whom all processes, including the process of garnishment, may be served. This is the only point that the Chief Justice thinks it necessary for the court to decide. Counsel for the plaintiff argued that as the receivers could not comply with the statute they and the interests they represented were not bound by it and ought not to be held to suffer the consequences of the Dreadnought company's default and that the receivers should be allowed to maintain the present suit.

Chief Justice Parkhurst says: "We found no ground for such contention. It is generally held that a receiver stands in the shoes of the person over whose estate he has been appointed and is clothed only with such rights of action as might have been maintained by such person."

Christmas was made a season of good cheer in reality in this community by a number of concerns connected with the rubber industry. Cash bonuses based on individual earnings were given to the employees of the Collyer Insulated Wire Co., Pawtucket, who had served a certain length of time. The Smith Webbing Co., Pawtucket, gave money to each employee in proportion to the individual's salary during the last five months. A Christmas present of \$50,000 was paid out by the Hope Webbing Co., of Pawtucket, to its 1,300 employees. In order to encourage thrift each employee received a large envelope containing in three equal amounts, a Liberty Bond of the fourth issue, War Saving Certificates and War Saving Stamps as well as a sum of money. This envelope was marked "March of the 1300," referring to the work of the 1300 employees of this concern during the period of the war.

* * *

The Tubular Woven Fabric Co., with a plant at Main Street, Pawtucket, has increased its capital stock from \$300,000 to \$350,000 according to its certificate filed at the office of the Secretary of State.

* * *

The American Electrical Works plant, at Phillipsdale, resumed operation Monday, January 6, after a two weeks' shut-down for overhauling of boilers and machinery and taking inventory.

* * *

The City Council of Newport has approved an appropriation of \$1,000 for 800 feet more or less of 2½-inch hose; \$200 for chemical hose, and \$150 for rubber clothing.

* * *

Harry Webster, of Milford, Massachusetts, formerly head draftsman for the American Wringer Co., Woonsocket, has been promoted to the position of production manager in charge of the entire output of the company.

* * *

The Bourn Rubber Co., has recently purchased another lot of land, with buildings thereon, located on Warren street, adjoining the present property of the concern.

THE RUBBER TRADE IN NEW JERSEY.

By Our Regular Correspondent.

ARTHUR E. FRISWELL, who has been connected with various rubber concerns in this country and abroad, is now associated with the New Jersey Car Spring & Rubber Co., Inc., Jersey City, in the capacity of consultant and general utility man.

* * *

The Overman Cushion Tire Co., Inc., 250 West 54th street, New York City, is building a one-story building 60 by 180 feet and a powerhouse 50 by 53 feet as additions to its plant at Belleville.

* * *

The Dural Rubber Corp., Flemington, will add a new unit to its factory to take care of its production of tires and tubes, and a new office building to accommodate its increased business.

* * *

Henry L. Hornberger has given up the profession of advertising to become general sales manager of the Globe Rubber Tire Manufacturing Co., Trenton. He will make his headquarters at the New York office.

* * *

F. N. Hammerstrom has been made vice-president and supervisor of sales of the Essex Rubber Co., Trenton. He was

formerly general manager of the Thermoid Rubber Co., Trenton, and has recently been commercial manager of the Wellsbach Co., Gloucester, New Jersey.

Samuel J. Mullane has been promoted to the position of superintendent of the Mattson Rubber Co., Lodi. He has been in the employ of the company for fifteen years.

John A. Lambert, treasurer and general manager of the Acme Rubber Manufacturing Co., presided at the New Year's dinner given at the Trenton Country Club to the seventy-five boy caddies employed there. It was the fifth annual event of this sort for the youngsters that has been arranged by Mr. Lambert, who is chairman of the caddies' dinner committee. Mr. Lambert,

TRENTON COUNTRY CLUB CADDIES AT NEW YEAR'S DINNER.

Charles E. Stokes, vice-president of the Home Rubber Co., and others gave talks. A feature of the dinner was the singing of parodies on popular songs, in which the caddies paid their respects to the golf players. An orchestra furnished music for the occasion. Mr. Lambert is an expert golf player and takes a big interest in the boys employed at the club. In the accompanying photograph, the notch at the top indicates where Mr. Lambert is standing. His son Raymond is on his left in uniform.

Joseph H. K. Lambert, son of John A. Lambert, secretary-treasurer of the Acme Rubber Manufacturing Co., has received his honorable discharge from the Navy and will resume his duties as assistant manager of the Acme company. Mr. Lambert's other son, John R. Lambert, is a member of the Gas Defense Service, and is stationed in New York.

Edward M. LaRue, who has been in charge of the service department of The Empire Rubber & Tire Co. for the past five years, has gone to Kansas City, Missouri, to become assistant manager of the Empire branch store in that city.

The employees of the Ajax Rubber Co. are to organize a patriotic league and benevolent association, 100 per cent strong, to assist members who become maimed, ill, or disabled while in the employ of the company. It is also intended to promote the education, Americanization, and material welfare essential to both employer and employee.

The store of the Federal Tire and Accessory Co., Wrightstown, New Jersey, was gutted by fire recently. The loss is about \$3,000. The fire was caused by spontaneous combustion.

William Henry Sayen, Jr., treasurer of the Mercer Rubber Co., returned from France recently and gave an interesting talk on the war to the employees of the company. Mr. Sayen and his brother went to France last May as Y. M. C. A. workers with the French army. His work took him only a few kilometers

from the front and his closest call was when he and a friend were caught in a barrage and his friend's legs were blown off. On another occasion a German aviator blew off part of the roof above them with an aerial torpedo. Following Mr. Sayen's talk to the employees an entertainment with vocal and piano selections was held in the plant.

The good will and chattels of the North American Rubber Co., a Delaware corporation, with an establishment at 34 Parker avenue, Trenton, for the manufacture of tires, was sold by Sheriff Fred P. Rees recently to Solomon Mixer, of New York, for \$560. The automobiles were sold to different parties. After the United States District Court had appointed Anthony S. Brennan as receiver for the company it decided that the concern was not bankrupt and ordered the sale of the chattels by Sheriff Rees. The machinery, etc., were sold to satisfy a judgment of \$2,896.40, secured in the New Jersey Supreme Court by Robert C. Dunham, of New Brunswick, New Jersey.

Lieutenant Charles A. Wilson has received an honorable discharge from the Army and will again represent the Dural Rubber Corp., Flemington, New Jersey, in New York City. Because of his commercial knowledge Mr. Wilson was one of eight privates selected from 20,000 men at Camp McClellan as candidates for commission without going to training school. When the armistice was signed he had become sub-depot quartermaster at Camp Hancock and had been recommended for a captaincy.

The Joseph Stokes Rubber Co. made a substantial gift of money to the Poor Kiddies' Christmas Fund during the holidays. John A. Lambert, secretary-treasurer of the Acme Rubber Manufacturing Co., who was chairman of the last Red Cross drive, was also an active worker during the holidays.

THE RUBBER TRADE IN CONNECTICUT.

By Our Special Correspondent.

THE Todd Rubber Co., Waterbury, has been succeeded by F. H. Potter, Inc., as of January 3, 1919. The incorporators are: A. V. Miller, N. R. Bronson, F. H. Potter. The officers are: H. A. Hoadley, president; F. H. Potter, treasurer; N. R. Bronson, secretary. The concern is incorporated under the laws of the State for \$25,000. It will distribute Kelly-Springfield and Gillette tires exclusively in Waterbury, Naugatuck, Thomaston, Torrington, Winsted, Norfolk, and Canaan, and will probably add a line of wholesale and retail automobile accessories.

The Seamless Rubber Co. had an industrial open house night at the Y. M. C. A. on the evening of January 15. The entertainment included mass singing and an exhibition by the Senior Leaders' Club in the gymnasium, followed by a social program and light refreshments.

William LaPine, Danbury, is acting as distributor in the State for the fiber soles manufactured by the Norwalk Tire & Rubber Co., Norwalk. The output has increased 100 per cent during the last two months.

Each of the 500 employees of the Norwalk Tire & Rubber Co., Norwalk, received a War Savings Stamp for a Christmas present.

Thirty young women who have been employed in the gas-mask department of the Hartford Rubber Works, Hartford, gave a luncheon to celebrate the completion of the contract. A chair was presented to the foreman, Edwin R. Sawyer, and a smoking set and tobacco to the assistant foreman, Herbert Martin, by the "eye" table workers in the same department at the celebration which took place when these workers were laid off, following the signing of the armistice.

The Rubber Trade in Great Britain.

By Our Regular Correspondent.

THE AFTERMATH OF WAR.

THE SIGNING of the armistice did not, of course, bring all contract work to a close, though it meant that all pressure was suspended and overtime rendered unnecessary. The general opinion among rubber manufacturers is that the government departments have treated them very fairly where deliveries on contract were no longer required. As a rule the officials have discussed matters with the manufacturers, and where it was evident that hardship or loss would result from the goods being left on the manufacturers' hands, satisfactory terms have been arranged. The interest of the moment is the transfer from war requirements to civilian business and although the civilian demands are large, owing to depleted stocks, competition of the keenest character has set in at once. This is especially the case with waterproof goods on account of the large number of plants available.

COMPETITION IN THE PROOFING TRADE.

It is said that the number of spreading machines in Great Britain has increased three-fold during the war, and the problem is how to find work for them. Not only have old established firms largely increased their number of machines, but there are now new works in existence, and these latter have not the old trade connections that the former have. As one instance of the result of competition may be mentioned a certain proofing which fell from 1s. 6d. to 10d. per yard in the course of a few days. Competition of this sort in the old days meant increased use of substitute. Probably reclaims will now be in greater demand than substitute for reducing costs, though their use is more complicated owing to the calculations necessitated from their varying content of mineral matter. A large demand has sprung up lately from both sexes for the black-surface, single-texture waterproof. It is a good many years now since this class of goods was almost a monopoly of one or two firms, owing to the details of the manufacture not being generally known. At the present time these black-surfaced goods are being turned out successfully by most of the firms which specialize in spreading. They are now of all qualities and prices and the high-quality formula, which alone was used twenty-five years ago, has now to compete with many lower-grade formulas.

Business generally in all trades is in a very stagnant position as nobody seems inclined to buy anything. The idea is that prices must fall all around and purchases are being deferred wherever possible. This applies also to rubber chemicals; manufacturers and agents are pushing for contracts at figures which certainly show a decline on those which have been ruling, but buyers are holding off as they think better terms will shortly be forthcoming. The very keenness of sellers to fix up contracts is a proof of what they think.

Solvent naphtha has dropped but is still quoted over 3s. a gallon, making its careful use a necessity in competitive work.

It is understood that the whole situation as regards the influence of the greatly increased spreading capacity of proofing works in relation to the business likely to be available is a matter which is now engaging the close attention of the India Rubber Manufacturers' Association, and it will be interesting to watch developments.

Matters in the mechanical trade are in much the same state of suspended animation. The head of a prominent firm told me that new business recently had been of the most meager description, though this did not cause him any concern as he had plenty of work held up which he could now resume. The general election has naturally been a disturbing factor which was followed closely by the Christmas holidays.

In times of good business very few firms go into court to settle disputes and there has been very little litigation during the last four years. It is natural to suppose that the lawyers will now have a better time, and indeed I hear of one or two cases, and by no means insignificant ones, which are expected to come into court before long.

CONDUCT OF THE RAW RUBBER TRADE.

In some recent remarks on the raw rubber trade in "The Economist," it is stated that probably no trade is conducted in a more haphazard and unorganized manner, and this because of the large number of individual producers, keen competition between them and conflicting vested interests which are permitted to stand in the way of every reform. This results in extremely wide price fluctuations from time to time doing much harm to every branch of the trade.

As an attempt to deal with a situation in which there are very dangerous elements it is suggested that a "term" market should be established in London and that all British-owned rubber should as far as possible be shipped to this country. This has been done with useful effect in the case of coffee and some other markets. The further statements to the effect that the trade is faced with critical conditions in the near future, and that rubber will probably be selling for long periods at less than the cost of production will, by some authorities at any rate, be considered as couched in a too pessimistic tone.

RUBBER IN AIRPLANES.

Day by day we are being enlightened on matters which have been kept secret during the war, and airplane construction is a subject which is now being talked about openly by authorities from Lord Weir, the Air Minister, downwards. It certainly appears that we are on the eve of a great development of airplane construction all over the world, and the article in the December issue of THE INDIA RUBBER WORLD on "Rubber in Airplane Construction" is of timely interest to the rubber trade. Many rubber goods, of course, have been made for the service, but they have been made to specification and very little detail as to their specific use has been vouchsafed. Now that the seal of secrecy has been broken there will be scope for individual enterprise.

WASTE RUBBER SALVAGE.

This scheme, to which I made a brief reference on a former occasion, has now been developed and put into action. It is under the joint organization of the Ministry of National Service, the National Salvage Council, the British Red Cross and the Order of St. John of Jerusalem. The object is to provide funds for the operation of the Red Cross. Appeals have appeared in the press asking the public to bring all articles of rubber such as motor and cycle tires, hose, belting, clothing, hot water bottles, toys, etc., to certain central dumps established in large towns. The War Office has undertaken to purchase all of the rubber goods collected. If this is to be done on strict business lines I should say that it will require a super-expert to arrive at the market value of a dump.

JAR-RING TESTS.

The article on this subject in the December issue of THE INDIA RUBBER WORLD was of great interest. It certainly seems that goods of this sort should be sold with a guaranty that they are fit for the purpose intended if loss of money and disappointment in the household are not to result. Up to the last year or two the bottling of fruit had been carried out in only a few households, but the advent of peripatetic government lecturers explaining the process led, or was expected to lead, to its wide-

spread adoption. I say "was expected" because the business did not materialize to any extent. In the first year there was a shortage of glass bottles, and in the second season, owing to the large government calls on an attenuated fruit crop, there was practically nothing left for the public to bottle, and what fruit there was on the market was at almost prohibitive prices. As the fortunate recipient of some bottled fruit from the country, I have had an opportunity of examining the rubber rings which I found broke quite easily. Of course I do not say that there are no really good rings on the market, but it certainly seems desirable that only rings of a certain standard quality should be allowed to be put on the market.

THE WORDS "INDIA RUBBER" AS A TRADE-MARK IN THE ARGENTINE REPUBLIC.

By Herbert Langner.

THE recent action of the India Rubber, Gutta Percha and Telegraph Works Co., Limited (La Compañía de Talleres de Caucho, Gutta Percha y Telégrafos, Limitada), Buenos Aires, a branch of the company of the same name in Silvertown, England, in filing an application for the registration of the words "India Rubber" as its trade-mark in Argentina to cover india rubber and gutta percha, either in a raw state or as a manufactured product, will undoubtedly be of considerable interest to all manufacturers and exporters of rubber goods in the United States of America, not only for the reason that if this trade-mark is granted it will create a monopoly in its use by the India Rubber, Gutta Percha and Telegraph Works Co., Limited, and preclude anyone else from using it in the Argentine Republic; also, anyone using it, whether accidentally or otherwise, would be liable a year's imprisonment, a fine of \$500, and confiscation of all goods bearing the mark.

The effects of such a registration upon shipments of india rubber products from this country to Argentina are apparent. Every domestic manufacturer would have to avoid marking his goods with the words "India Rubber" and abstain from these words in describing his goods, so as not to infringe this trade-mark.

It is therefore easily seen that should the Argentine Trade-mark Office countenance this application, as seems to be the case, it may work a great hardship to American concerns doing business in Argentina and who may have described their products as made of india rubber.

The question naturally arises: Is anyone entitled to register as a trade-mark in Argentina an expression in common use in the English language? Can words like "Gum arabic," "Portland Cement," "Russia Leather," "Virginia Tobacco," "French Chalk," "Holland Gin," etc., all of which are common descriptive words, be considered registerable trade-marks in that country? This is apparently answered by a decision of the Argentine Federal Courts in an action brought by Borden's Condensed Milk Co. against Horlick's Food Co. on the question of the validity of the registration of the trade-mark "Malted Milk" in Argentina. The evidence showed that this product was made in large quantities in the United States of America, and that since "Malted Milk" was the descriptive name of a well-known product and indicated an article of a certain class, it did not constitute a good trade-mark, notwithstanding the fact that "Malted Milk" was an expression foreign to the Spanish language. If "Malted Milk" cannot properly be registered, then it would seem that "India Rubber" should not be registered, for the same reason.

The Argentine trade-mark law under which the present attempt to appropriate the mark "India Rubber" is being made, would, to the American mind, appear to be at fault, although a reference to the law defining what is registerable as a trade-mark in Argentina can leave no doubt that the words in question are not registerable. Article 3 of this law distinctly states

that terms or expressions which are in general use, and designations usually employed to indicate the nature of the article, or the class to which they belong, cannot be considered trade-marks. It would therefore seem that the interpretation of the law by the Argentine officials, rather than the law itself, is at fault, and that the present application to register "India Rubber" should not have been entertained by the Trade-mark Office. The application was advertised in the Argentine Official Journal, according to the Argentine law, for the purpose of bringing the mark to the notice of parties likely to be injured by its registration, and an opposition has been entered by a well-known American manufacturer

THE "SILVERTOWN" FACTORY IN BUENOS AIRES.

of rubber products, who contests the right of the British concern to secure a monopoly on these words. Its action in so doing, if successful, may be of benefit to the entire American industry and particularly to concerns exporting to Argentina.

SAMPLE FAIRS AT LYONS AND BORDEAUX.

The sample fairs to be held in Lyons and Bordeaux, in March and May, respectively, offer to American manufacturers an opportunity to become better acquainted with the products of France and its colonies as well as for the sale of American-made goods in those quarters.

It is suggested that it would be particularly advantageous for the American exhibitor to arrange to have his display transferred from Lyons to Bordeaux. The New York agent of the Lyons fair is Emil Garden, 21 Park Row, New York City. All exhibits for the Lyons fair must leave New York before February 5.

At the Lyons fair in 1918 there were more than 500 American exhibitors out of a total number of more than 3,000, and it was planned to erect a \$70,000,000 palace to house it in future.

As a result of the effort being made to increase the importance of Bordeaux as a transshipping port for the colonies of western and northern Africa, the predominating exhibits at the Bordeaux fair will be of colonial products, including rubber, oils and oil seeds, graphite from Madagascar, forestry products, etc. There will also be exhibits of chemicals and other products of the soil.

The Third Sample Fair held at Lyons in 1918, was a great success, but as none was held at Bordeaux last year, the coming exhibition there will be the Third Bordeaux Sample Fair. Prospective American exhibitors should communicate at once with the Comité d'Organisation et Administration de la Foire de Bordeaux, Hotel de Ville, Bordeaux, France, relative to securing space, and with the steamship companies concerning transportation accommodations, as the Bordeaux fair has no official representative in this country as far as known.

The Future of the Antwerp Rubber Market.

FOR four years, Antwerp, one of the world's great transit rubber markets, has been closed and its rubber trade completely wiped out. What will be its future now that the commerce of this port may be resumed?

Certainly business will return but slowly at best, for most former patrons have found other satisfactory sources of supply, and Belgian brokers will have to reestablish themselves from the ground up, so to speak. Lack of adequate ship tonnage will for a time be a great drawback. Moreover, economic forces altering the whole trend of the rubber trade have been set in motion by the war. Direct dealing between producing and consuming countries has become the rule, and to a considerable degree will continue. While this grew out of necessity, the results have shown that any transit market is, in principle, expensive and unnecessary, and the keen foreign trade competition likely to develop in the near future will tend toward a policy of eliminating all possible overhead charges.

In 1913 the total Belgian imports, mostly through the port of Antwerp, amounted to 32,438,360 pounds, the principal sources in pounds being as follows: Belgian Congo, 8,690,647; Great Britain, 6,676,314; Ceylon, 5,253,833; Netherlands, 2,993,538; Germany, 2,303,611; France, 2,087,644; Straits Settlements, 1,110,817.

Total exports for that year amounted to 24,400,770 pounds, indicating that only 8,037,590 pounds, or about one-fourth of the total imports, either were retained for use or remained in stock. The principal destinations of the exports in pounds were as follows: United States, 6,104,316; Germany, 5,944,162; Russia, 4,600,961; Netherlands, 2,586,973; France, 2,327,131; Great Britain, 1,578,819.

For three years prior to the war, Belgian crude rubber imports from Great Britain, Ceylon, Netherlands, Germany, and Straits Settlements had shown a steady increase, whereas imports from France had undergone a corresponding decrease, and those from Belgian Congo in 1913 were 1,275,954 pounds less than in 1912. Crude rubber exports from Belgium to the United States, Germany, Russia, and Netherlands for the

three years prior to the war had shown a steady increase, whereas exports to Great Britain had undergone a steady decrease, and those to France had maintained an approximate average. But many of these tendencies seem unlikely to continue.

The bulk of Belgian Congo rubber will doubtless go to Antwerp as in the past, but this rubber is derived chiefly from wild sources and has been diminishing rapidly. Great Britain, Ceylon, and Straits Settlements are successfully marketing their rubber to consuming countries and will continue to do so very largely, or through London, so that Belgian imports from these sources will in future correspond more nearly to the manufacturing needs of the country than hitherto. Germany no longer has African colonies producing rubber, and with a limited merchant marine following a complete rubber denudation will have little, if any, for re-export. Moreover, German interests are said to have contracted for a portion of the output of the Dutch East Indies, doubtless to be shipped direct or through Rotterdam, so that little of this rubber will reach Belgium through the Netherlands.

Germany will naturally prefer at first to deal with neutrals so far as possible, and Belgium, which has been one of the chief sufferers at the hands of the Hun, will prefer to have it so, notwithstanding commercial considerations that might sway other nations more remote from the tragedies of the war. This means

that Belgian rubber exports to Germany, which were more than double the rubber imports from Germany, will be relatively small for some years if a satisfactory market can be found elsewhere, and it probably can. The United States, Belgium's best former customer, has found direct shipments from the East so satisfactory that she will hardly go to Belgium for any consid-

erable quantity of rubber hereafter. Russia is still in too great a state of chaos to become an extensive early buyer, while such a quantity and variety of rubber is grown under the British flag that England will have little need to resort to Belgian sources. The likelihood of a resumption of former trade with France and the Netherlands is more hopeful, however.

EXAMINING RUBBER AT THE ANTWERP MARKET.

RECEIVING RUBBER AT ANTWERP.

All indications point to the conclusion that, although Antwerp will again take its place among the important rubber markets of the world, it will not soon attain the position it formerly held as a crude rubber mart.

REGULATIONS GOVERNING SINGAPORE STANDARD RUBBER QUALITIES.

THE Singapore Chamber of Commerce Rubber Association publishes in the "Straits Budget" of December 6, 1918, the regulations now governing Singapore standard rubber qualities.

The committee will consist of six members to meet twice weekly to examine all guaranteed samples submitted to them and establishing whether they are found to be: Singapore standard first latex crepe or Singapore standard f.a.q. ribbed smoke sheets.

At any meeting a quorum shall consist of not less than three members.

The place of meeting is the board room of the Singapore Chamber of Commerce Rubber Association, at 11 a. m., on Tuesdays and Fridays. Sellers wishing to place samples before the committee for award, must have their samples at the board room, Chartered Bank Chambers (top floor), between the hours of 8.30 a. m. and 9.30 a. m. on these days. All samples submitted to be sealed and carefully checked by the sellers.

The committee shall have power to approve a sample notwithstanding an earlier refusal to issue an award, and shall also have power to cancel any award issued, should it be found necessary. In the event of an award being cancelled after the rubber has been tendered to the buyer, the seller may be called upon by the committee to replace the bulk with approved quality within three clear working days of notice of cancellation.

For such lots as are presented to the Standard Qualities Committee for award, a fee of \$5 per sample representing 10 tons or any part thereof shall be paid to the Singapore Chamber of Commerce Rubber Association, such fees to be paid at the time samples are submitted.

Only members of the Singapore Chamber of Commerce Rubber Association may submit lots for award, and written "Application for Award" forms in duplicate must accompany samples, stating details.

The individual members of the standard qualities committee shall receive such remuneration as shall be decided upon by the committee of the Singapore Chamber of Commerce Rubber Association.

On samples which have passed the Standard Qualities Committee, the secretaries will issue an award form (numbered consecutively), stating full particulars as to marks, etc. This award to be signed by the secretaries and handed to sellers. On such samples which are submitted for award, details of the bulk must be submitted on the label attached. After approval, the seal of the committee shall be affixed, with award number, by the secretaries.

In the event of any parcel or parcels of standard quality being sold for delivery during a specified month, samples representing the said parcel or parcels shall be submitted to the Standard Qualities Committee not later than four clear working days before the end of the month of delivery.

It shall be the desire of the Standard Qualities Committee to establish a standard of quality which may represent the bulk of the crop of No. 1 qualities, but the committee shall have power to vary their decision in accordance with ruling conditions. Lots of a mixed character (from various estates) bulked into one parcel shall not constitute standard quality.

First latex crepe shall be well prepared dry rubber of good quality, of even color, and free from all stains, spots, or traces of oxidation.

F.a.q. ribbed smoked sheet shall be clean, tough rubber, free

from mold, dampness under or over-smoked sheets. Slight traces of air-bubbles may be allowed, but at the discretion of the Standard Qualities Committee.

All rubber sold as standard quality must be certified by the Standard Qualities Committees before tender, and sellers must be in a position to deliver the rubber at the time the tender is made. Tender forms must show the number and date of award, which award shall remain in force for a period of one month from the date of issue, and tenders must also show the reference number and name of original seller or original selling broker.

In no case will a seller be permitted to make first tender against a contract sold for delivery during a specified month any later than three working days before the end of the month of delivery.

No addition can be made to a tender, and if any party finds it necessary to split a quantity tendered, new tender forms must be made out, which forms must bear original particulars and state the name of the party who split the tender.

All tenders to be made on official forms, which are obtainable from the association. Each party to endorse the time of receipt on the form, and if the tender is intended for circulation, same must be passed on as promptly as possible and not later than one business hour after receipt. Business hours shall not include the period between 1 p. m. and 2 p. m. or after 4.30 p. m. on week days, and 12.30 p. m. on Saturdays.

Last buyer shall make application to the first seller for delivery within 24 hours of receipt of tender. The rubber to be delivered to the last buyer within 48 hours from the time of the receipt of this application.

Before delivery, the buyer shall deposit with the first seller 90 per cent of the estimated value of the rubber or approved banker's guarantee. When final weights are known, invoices and account sales must be promptly rendered and settled, upon which settlement first seller shall refund to last buyer any deposit which may have been made.

Samples of awarded lots tendered on contracts must be available for inspection in the secretary's sample room, at Exchange Buildings, at the time tender is made, and shall not be removed by other than last buyer who must collect same and weigh in with bulk at time of weighing.

All official tender forms shall be accompanied by seller's memorandum of tender which must state: date of contract, quantity sold, description, delivery, price, tender number and weight tendered, first seller's reference number.

TAPPING AREA AND PRODUCTION IN MALAY PENINSULA AND BRITISH NORTH BORNEO.

The area of rubber tapping in the Federated Malay States, in 1917, was 518,109 acres, 408,574 acres of which were in estates of 100 acres and over and 109,535 acres in estates of less than 100 acres, according to the "Agricultural Bulletin of the Federated Malay States." As the output for the Federated Malay States for 1917 was 79,831 tons, this represents an average annual yield of 345 pounds to the acre. If the yield is reduced to 200 pounds per acre, the total output would be 46,000 tons.

Johore exported 19,061 tons of rubber in 1917. The area in tapping was 117,000 acres, which means 361 pounds to the acre. In Kedah, 45,000 acres were tapped, 258 pounds to the acre. The output of Kelantan, for between 13,500 and 15,000 acres, was 1,490 tons; the yield for 1917 was, therefore, either 247 or 222 pounds per acre. The area under tapping in Malacca was estimated by the Resident to be 180,000 acres, with 120,000 acres in tapping, a yield of 300 pounds to the acre. In Penang, the area in tapping was 32,289 acres, or 273 pounds to the acre. In British North Borneo, the area under rubber was 34,828 acres, of which 21,400 acres were in full tapping; the output was 2,444 tons, 256 pounds per acre.

Recent Patents Relating to Rubber.

THE UNITED STATES.

ISSUED NOVEMBER 5, 1918.

- N**O. 1,283,461. Expandable annular packing. G. Bergeren, Brooklyn, N. Y.
- 1,283,468. Two-part rubber heel. W. H. Clarke, Akron, O.
- 1,283,530. Wheel rim for pneumatic tires. H. H. Huffman, Columbus, Ohio.
- 1,283,753. Tire race. R. Hareline, assignor to The Fisk Rubber Co.—both in Chicago, Ills.
- 1,283,853. Demountable rim for tires. A. Mentzer, Duluth, Minn.
- 1,283,860. Fountain-pen cap. O. Mitchell, Brookline, assignor to Moore Pen Co., Boston—both in Mass.
- 1,283,874. Resilient tire. I. L. Ogden, Chicago, Ill.
- 1,283,944. Fountain pen. W. A. Staffeldt, Reading, Mich.
- 1,283,953. Hose-supporter clasp. H. J. Stuart, Derby, assignor to Robert N. Bassett Co., Inc., Shelton—both in Conn.
- 1,283,954. Hose-supporter button-clasp. H. J. Stuart, Derby, assignor to Robert N. Bassett Co., Inc., Shelton—both in Conn.
- 1,283,955. Hose-supporter button-clasp. H. J. Stuart, Derby, assignor to Robert N. Bassett Co., Inc., Shelton—both in Conn.
- 1,284,014. Turn sole with forepart of rubber compound with fibrous stitching-receiving element for single-faced stitches, etc. S. W. Winslow, Jr., Beverly, assignor to United Shoe Machinery Corp., Paterson, N. J.
- 1,284,178. Swimming web for the hand. J. A. Clarke, assignor of one-half to J. Zarafentis—both of Vincennes, Ind.

ISSUED NOVEMBER 12, 1918.

- 1,284,229. Demountable split rim for tires. J. A. Brown, Chicago, Ill.
- 1,284,232. Wind-shield cleaner. W. J. Burke, San Francisco, Calif.
- 1,284,296. Breast pump. J. F. McLeary, Findlay, O.
- 1,284,429. Puncture-proof material consisting of metal plates coated with hard rubber and encased in soft rubber cushion. C. S. G. Nichols, Kansas City, Mo.
- 1,284,466. Resilient tire. F. Salari, Bisbee, Ariz.
- 1,284,525. Fountain pen. R. T. Wing, St. Cloud, Minn.
- 1,284,530. Pneumatic support for vehicles. W. G. Wood, Sacramento, Calif.
- 1,284,536. Double-cuffed sleeve-protector with elastic cord at wrist of inside cuff. B. J. Yaeger, Minneapolis, Minn.
- 1,284,632. Suspensory jack-strap. R. C. Fine, Los Angeles, Calif.
- 1,284,633. Demountable rim for solid tires. W. R. Finlay, San Francisco, Calif.
- 1,284,832. Metal and rubber tire. J. B. Wallace, Mukwonago, Wis.

ISSUED NOVEMBER 19, 1918.

- 1,284,970. Motor-wheel with rubber tire. O. A. Anderson, Highland Park, Mich.
- 1,284,995. Rubber heel with friction plug. F. Berenstein, Chelsea, Mass.
- 1,285,012. Electric cable. C. P. Brodhead, assignor to Hazard Manufacturing Co.—both of Wilkes-Barre, Pa.
- 1,285,027. Garter. Daniel G. Butts, assignor to Ivory Garter Co.—both of New Orleans, La.
- 1,285,084. Rubber tire, with carcass composed of woven vegetable fabric and asbestos cloth, vulcanized together. R. J. Evans, Franklin, Pa.
- 1,285,103. Demountable rim for tires. W. H. Fox, assignor of one-half to Bernard W. Jans—both of Minneapolis, Minn.
- 1,285,206. Fountain pen. J. H. Marsh, New York City.
- 1,285,325. Belt composed of non-elastic and elastic elements. I. Nelson, Eagle Grove, Ia.
- 1,285,391. Pneumatic mattress. C. R. Robertson, assignor of one-half to O. Deveney—both of Columbus, O.
- 1,285,405. Double garment, with valves for admitting and emitting fluid such as hot water, for treatment of invalids. P. Sangoff, Worcester, Mass.
- 1,285,410. Cushion tire. M. Scrocco, New York City.
- 1,285,474. Tire insulator of asbestos cords woven around core of rubber, for insertion between pneumatic tube and outer shoe, or in body of outer shoe, of pneumatic tire. J. W. Stinson, Garden City, N. Y.
- 1,285,481. Thick reducer. M. V. Vincent, Brooklyn, N. Y.
- 1,285,507. Belt with elastic section, etc., for supporting artificial limbs. S. H. Waterman, Seattle, Wash.

ISSUED NOVEMBER 26, 1918.

- 1,285,604. Inner tube protector for pneumatic tires. H. S. Blynt, Galipolis, O.
- 1,285,605. Resilient tire. A. Boerner, Scheveningen, Netherlands.
- 1,285,618. Pneumatic wheel with rubber tire. J. A. Carter, St. Louis, Mo.
- 1,285,719. Air-tube for pneumatic tire. I. B. Jeffries, Llanely, Wales.
- 1,285,722. Pneumatic tire with metallic casing. E. A. Jones, Los Angeles, Calif., assignor to Jones Holding Syndicate, Seattle, W. Va.
- 1,285,730. Vehicle tire. A. H. Keller, Philadelphia, Pa.
- 1,285,734. Fountain-pen cap and clip. I. W. Kessel, Brooklyn, N. Y.
- 1,285,741. Drive shaft. P. Konojoh, assignor to F. J. Euer, Hamilton, Ont.
- 1,285,757. Demountable rim for tires. S. R. McKay, assignor to The McKay Co.—both of Cleveland, O.
- 1,285,818. Balloon cycle. J. C. Winn, Buffalo, N. Y.
- 1,285,871. Artificial foot. C. R. Winn, Buffalo, N. Y.
- 1,285,877. Golf ball. G. C. Worthington and W. E. Reichard, assignors to Worthington Ball Co.—all of Elyria, O. (Original application divided.)
- 1,285,878. Golf ball. G. C. Wentworth, Elyria, O.
- 1,285,891. Paving block of reinforced rubber for roadways, etc. G. Anderson, London, England.
- 1,285,944. Cushion wheel. H. B. Coats, Veederburg, Ind.
- 1,285,963. Auxiliary tread for pneumatic tires. C. A. Hazlett, New Haven, Conn., assignor to F. J. Euer, Hamilton, Ont.
- 1,285,974. Tire to L. Artender East Haven—all in Conn.
- 1,285,974. Tire protector. P. L. Harvey, Des Moines, Iowa.

- 1,286,030. Reinforced hard-rubber structure. E. J. Krieger, Akron, O., assignor to The B. F. Goodrich Co., New York City.
- 1,286,081. Golf ball. W. Pearce, Akron, O., assignor to The B. F. Goodrich Co., New York City.
- 1,286,107. Tire-forming tube of reinforced rubber. I. R. Renner, Akron, O., assignor to The B. F. Goodrich Co., New York City. (Original application divided.)
- 1,286,131. Armored tire casing. W. H. Sampson, Grand Island, Neb.
- 1,286,133. Liquid-dispersing bottle-stopper. Theodore J. Snyder, assignor of one-fourth each to George S. Jacobs and Meyer H. Eichenberger—all of Chicago, Ill. (Continuation of application Serial No. 97,811, filed May 16, 1916. Renewed August 28, 1917. Serial No. 188,695. This application filed February 14, 1918. Serial No. 217,047.)
- 1,286,163. Demountable rim for tires. F. C. Walters, Akron, O.
- 1,286,169. Resilient heel. B. W. Brockett, Cleveland, O.
- 1,286,173. Demountable rim for tires. O. E. Edstrom, Oakland, assignor to Remountable Rim Co., San Francisco—both in Calif.
- 1,286,176. Sole for turn shoes, consisting of rubber body and fibrous edges to permit stitching. G. Ferguson, Wollaston, Mass., assignor to United Shoe Machinery Corp., Paterson, N. J.

ISSUED DECEMBER 3, 1918.

- 1,286,198. Combination legging with resilient foundation. J. Asheim, Celanese, N. Y. (Original application divided.)
- 1,286,206. Wheel rim pneumatic tires. E. S. Beeman, assignor of one-half to W. F. Pusch both of La Porte, Ind.
- 1,286,307. Elastic wheel with pneumatic pad between inner rim and hub. S. C. Hatfield, Baltimore, Md.
- 1,286,348. Resilient wheel with pneumatic tube around hub. J. A. Kolby, P. J. Larsen and C. J. Nielsen, assignors to Kolby Wheel Co., all of Fairport, N. Y.
- 1,286,396. Bovine glove with sponge-rubber filling or padding. Z. G. Odham, Los Angeles, Calif.
- 1,286,437. Toy firearm operated by elastic bands. E. F. Sear, Hollingswood, N. J.
- 1,286,524. Wheel rim for pneumatic tires. E. W. Bryan, Valdosta, Ga.
- 1,286,579. Ballroom inflator. R. K. Hammer, Akron, O., assignor to The B. F. Goodrich Co., New York City.
- 1,286,594. Wind-shield cleaner. M. Irye, Los Angeles, Calif.
- 1,286,635. Resilient shoe with pneumatic sole and around heel. J. Kriek, assignor of one-third each to P. Kitchen and J. A. Pinck—all of Gallup, N. M.
- 1,286,727. Fountain pen. J. M. Reynolds, Montrose, Colo.
- 1,286,786. Wheel rim for automobile tires. R. B. Robinson, Kansas City, Mo.
- 1,286,798. Garment-belt with elastic element to provide for expanding. L. J. Schinman, New York City.
- 1,286,834. Golf ball. W. Taylor, Leicester, England.

THE UNITED KINGDOM.

ISSUED DECEMBER 11, 1918.

- 119,699. Truss with rubber pad. A. W. Lewis, 130 Commercial street, Moonmouthshire.
- 119,746. Hygienic syringe with rubber piston. J. D. Marshall, 25 Chalfont Court, Regent's Park, London.
- 119,752. Folding portable bath of waterproof sheeting, etc. J. L. McCann, 13 Canadian General Hospital, Ore. Hastings, Sussex.
- 119,757. Doll with rubber hands and feet. L. Wilks, Dunningley, Great Woodcote Park, Purley, Surrey.
- 119,760. Chest expanders, corners and abdominal belts having elastic inserts. A. Berger, 34 Trevor Square, Brompton Road, London.
- 119,771. Doll having head, limbs, etc., jointed to body by elastic cords. C. E. Green, 39 Hutton Garden, London.
- 119,812. Artificial leg with cushioning pad of rubber on front of foot. G. de Costellat, 21 via del Quirinale, Rome, Italy.
- 119,838. Reinforced tire. W. L. Varner, Athens, Georgia, U. S. A.
- 119,866. Life-saver suit. J. E. Lenage, 189 St. James' street, Montreal, Canada. (Not yet accepted.)
- 119,900. Pneumatic wheel with rubber tire. J. K. McKellar, Alderlands, Essex, Surrey.

ISSUED DECEMBER 18, 1918.

- 120,004. Rubber-coated wire stringing for tennis rackets, snow-shoes, etc. S. G. Lewis, Greensburg, Pa., U. S. A.
- 120,077. Resilient cushion wheel. A. L. W. Begg, 1482 Broadway, New York City, U. S. A.
- 120,088. Gas bag for motor vehicles. R. Russell, The Acres, Middleton, Great Manchester.

A NEW VEGETABLE WAX.

Samples of wax gathered from the wax palm, known in Ecuador as the gualte, and samples of Mexican candleilla wax are being exhibited in San Francisco by the Bureau of Foreign and Domestic Commerce. Markets are sought for these two commodities. The candleilla wax is of light color and very hard with a high melting point. Purified, it will make the best quality of candles, lasting and giving a brilliant light. Dissolved in turpentine it makes excellent varnish, and it is also used in the manufacture of shoe polish, phonograph records, electric insulation, as a substitute for beeswax, etc.

COMMERCIAL AGREEMENT BETWEEN FINLAND AND SWEDEN.

Rubber and products thereof purchased in Sweden by Finnish buyers must now be paid for in goods up to 100 per cent. of their value, as rubber is merchandise in Class 1, which is that of the highest value. For goods in Class 2, Finland must pay Sweden 60 per cent. in merchandise and the balance in cash. For articles in Class 3, payment must be made 20 per cent. in goods and the balance in Finnish money; and several other countries seem to be contemplating similar arrangements to make international trade possible.

Crude Rubber During 1918.

THE YEAR opened with a slight upward tendency which, however, was not maintained. There was so little spot rubber on the market that the demand fell off. Then came the railroad congestion, with the resulting embargoes, and the government order shutting down factories. Toward the end of January accumulations of rubber began pulling up at Pacific ports owing to the breakdown of the transcontinental freight service. On January 29, first latex, spot, was 55 cents, and upriver fine, spot, 58 cents.

During February manufacturing interest was entirely lacking and dealers showed no desire at all to accumulate supplies, so that all activity ceased. The railroads resumed, under unprecedented difficulties, the eastward movement of rubber from the Coast. The President's proclamation licensing all imports, including crude rubber, resulted in a firm undertone. Quotations on February 26 were: first latex crepe, spot, 55½ cents, and upriver fine, spot, 57 cents.

Dullness characterized the market during the first half of March, but in the third week it began to be feared that arrivals at Pacific ports would be greatly reduced owing to the taking over of the Dutch ships. Importers and manufacturers, therefore, came into the market with good-sized orders. Prices accordingly advanced and remained at the higher levels even after the demands were satisfied, as buyers were showing an interest in forward positions. On March 28 first latex crepe, spot, was 59 cents, and upriver, spot, 61 cents.

Very little business was done during the first three weeks of April, but a very heavy buying movement followed a meeting of a special rubber trade committee with the War Trade Board at Washington on April 18. This conference discussed the problem of rubber imports in connection with the ever-increasing demands for shipping to and from Europe. What was said at the meeting did not transpire, but manufacturers and shorts participated in sending prices up sharply in an excited market. First latex crepe, spot, reached 71 cents, and upriver fine, 69 cents. By the last of the month latex was one cent lower, but upriver did not decline.

Government control of crude rubber importations became effective on May 1. Under the option and guaranty clause the Government optioned the standard grades of crude rubber at the following prices, c. i. f. New York: standard smoked sheet, 62 cents; first latex crepe, 63 cents; fine Pará, 68 cents—these prices not to apply to rubber contracts in force prior to May 1, 1918. Imports for the three months beginning May 1 were limited to 25,000 tons, government requirements coming first, the balance to be allocated to each manufacturer at the rate of 7/16 of his consumption during 1917. Then the Government fixed prices for all other grades. All of these innovations were accepted by the rubber trade with equanimity.

The market was stagnant during the month of June. The large consumers had bought forward plantation rubber to the limit of their allocations. It is true that rubber free from the import restrictions was in continued demand, but the supply was soon exhausted. Later in the month maximum prices on jelutong, gutta siak, gutta percha and balata were fixed by the Government.

During July the market was virtually dead, partly under the influence of the three months' experimental restriction period, which began on May 1, and partly because of waiting to learn from Washington what regulations would be enforced for the balance of the year. Manufacturers' allocations had evidently been covered, for very few certificates appeared. Standard plantation grades for future shipment were quoted as low as 42 cents, New York. A few small lots of free rubber were sold by importers against similar quantities to be shipped against allocation certi-

ificates from stocks bought in the Far East prior to May 8, and for which no marketing provision had been made in the government regulations.

For August and September the Government decided to permit the importation of 16,666 tons of crude rubber, the needs of the United States and allied governments coming first, the balance being allocated to manufacturers at the rate of 3/8 of 1/6 of their consumption during 1917; manufacturers not operating at full capacity in 1917 to receive allocations according to a special formula. It was also ordered that the number of tire casings and tubes produced and the amount of rubber used during

FLUCTUATIONS OF UPRIVER FINE, FIRST LATEX CRÉPE AND SMOKED SHEET RUBBER SPOT RUBBER DURING 1918.

August and September should only be 50 per cent of the production and consumption during 1917. Pará's were quoted at 60 to 61 cents for August-September shipment during the latter part of August, but the consuming demand was limited to small quantities for immediate requirements.

Quiet market conditions prevailed during September. Crude rubber imports were fixed at 25,000 tons for October, November and December, according to previous allocations. Toward the middle of the month considerable free rubber was offered by manufacturers who were overstocked, and sales were reported to have been made at prices ranging from 51 to 61 cents for crepe and 49½ to 60 cents for ribs. Trading in allocation certificates was an unusual feature of the market, and the Far East received attention from manufacturers, relieving the distress in that quarter to some extent.

The October market was extremely dull. Orders for allocated and free rubber were infrequent and unimportant in volume. Allocated rubber remained firm, latex ranging from 37 to 42 cents, and ribs from 35½ to 40 cents. Free rubber prices ranged from 58½ to 62 cents for latex and 57½ to 61 for ribs. Prices on allocated Pará grades varied but little; upriver fine, from 56 to 58 cents. The price on free rubber ranged from 62 to 66 cents for upriver fine.

For a brief period after November 11 the market condition improved, and the Government permitted the importation of 7,500 tons over and above the amount previously allowed for the period ending December 31. Allocated rubber was quoted on November 12 at 51 cents for latex and 49 cents for ribs. Free rubber prices on November 26 were: 60 cents for latex and 52 cents for ribs. At the same time, upriver fine was quoted at 66 to 68 cents.

During December quietness characterized the market. All restrictions as to the quantities of rubber that might be imported were removed. Import licenses were thenceforth to be granted regardless of quantities involved. Government option prices were withdrawn and undertakings as to maximum values were no longer required; the rubber, however, to be consigned to The Rubber Association and the usual guaranties required. Balata, gutta percha, gutta siak and jelutong are included in the term rubber as used in this paragraph. On December 26 first latex crepe was 54 cents, and upriver fine, 61 cents.

Review of the Crude Rubber Market.

NEW YORK.

A COMATOSE market, with occasional slight signs of animation, is not what an optimist likes to review. We positively decline to join the ranks of the discouraged, however, as the needs of the world for rubber products are too great for the present apathy to continue very long. Whatever troubles rubber men may be facing they can at least be glad that the last government shackles were removed on January 20, when the War Trade Board announced that importations of crude rubber, jelutong, balata, gutta siak, gutta percha, scrap, and reclaimed rubber are no longer to be consigned to The Rubber Association of America, and also that importers of crude rubber are no longer under the necessity of cabling license numbers to their shippers.

Annual inventories of stocks have been claiming attention and machinery which had been used to the limit for war production is being repaired. Production of rubber goods must soon start, probably not with a rush, but sufficiently to enable us to register a steady monthly improvement from now on.

The Singapore Government has cancelled the compulsory regulations regarding baled rubber that required a minimum of 220 pounds for sheets and 165 pounds for crepe to be packed in five cubic feet.

PLANTATIONS.—On the 7th of January spot latex was 58 cents, January-February shipments 56 cents; spot ribs were 58 cents, January-February shipments 56 cents; spot No. 1 amber crepe was 55 cents, January-February shipments 50 cents; spot No. 1 brown crepe was 38 cents, January-February shipments 36 cents.

On January 27 spot latex was 52 cents, April-December shipments 49 cents; spot ribs were 51 cents, April-December shipments 47 cents; spot amber crepe was 47½ cents, April-December shipments 45 cents.

PARAS.—On January 7 spot upriver fine was 64¼ cents, January-February shipments 60 cents; spot upriver coarse was 34½ to 35 cents; spot upper caucho ball was 35 cents, February-March shipments 34¼ cents; spot cameta was 25 cents, February-March shipments 24 cents; spot islands coarse was 24 cents, February-March shipments 23 cents.

On January 27, spot upriver fine was 59½ cents; spot upriver coarse was 35½ cents, February-March shipments 35½ cents; upper caucho ball was 34 cents; spot islands coarse was 24 cents; spot cameta was 24 cents.

NEW YORK QUOTATIONS.

*Rubber Association of America nomenclature.

**Nominal.

RECLAIMED RUBBER.

New developments were lacking in the reclaimed rubber market during the past month. The inactivity on the part of the consuming trade is attributable to the hesitancy that dominates most industries in the period of reconstruction. The demand has been of a routine nature, but of sufficient volume to maintain prices that are unchanged from those quoted a month ago.

THE MARKET FOR COMMERCIAL PAPER.

In regard to the financial situation, Albert B. Beers, broker in crude rubber and commercial paper, No. 68 William street, New York, advises as follows:

During January there has been a fair demand for commercial paper, principally from out-of-town banks, the best rubber names going at 5 1/2 to 6 percent, and those not so well known 6 to 6 1/2 percent.

MARKET CABLE SERVICE FROM SINGAPORE.

The following report of the auctions held at Singapore has been cabled by The Waterhouse Co., Limited:

Date.	Crêpe.	Ribs.	Market.
January 20cents 42.2	41	Uncertain.

Rates to Pacific Coast have been reduced to \$35 per cubic ton. Cargo space plentiful.

WEEKLY RUBBER REPORT.

GUTHRIE & CO., LIMITED, Singapore, report [December 13, 1918]: At the weekly rubber auction held yesterday and today, demand was on a very limited scale, the manufacturing interests being practically out of the market. Prices of standard grades show only a slight weakening, but the state of market may be judged from the fact that only 638 tons were sold out of 1,567 tons cataloged.

Ribbed smoked sheet was difficult of sale, and the top prices of 7 1/2 cents is 1 cent below last week's best. Fine pale crepe was in good demand and is unchanged at 75 cents. Lower grade crepes were the special enquiry of the market and fine and good browns show an advance of 3/4 cent.

The following was the course of values:

	In Singapore per Pound.	Sterling Equivalent per Pounds in London.
Sheet, fine ribbed smoked.....	70 1/2 @ 7 1/2	2/1 0/1 @ 2/1 1/2
Sheet, good ribbed smoked.....	57 1/2 @ 6 1/2	1/9 1/4 @ 2/0 3/5
Sheet, plain smoked.....	55 1/2 @ 2 1/2	1/8 3/4 @ 2/1 1/2
Crepe, fine pale.....	73 @ 7 1/2	1/10 @ 2/1 1/2
Crepe, good pale.....	60 @ 7 1/2	1/10 @ 2/1 1/2
Crepe, fine brown.....	52 @ 60	1/7 3/4 @ 1/10
Crepe, good brown.....	40 @ 60	1/7 3/4 @ 1/10
Crepe, dark.....	29 1/2 @ 39 1/2	1/1 1/8 @ 1/4 1/8
Crepe, bank.....	15 @ 39 1/2	1/1 1/8 @ 1/4 1/8
Scrap, virgin and pressed.....	28 @ 1 1/8	1/8 @ 1/8
Scrap, lower.....	21 @ 39 1/2	10 1/8 @ 1 1/8

THE MARKET FOR RUBBER SCRAP.

NEW YORK.

THERE was quite a little business during the month of January although the volume of transactions decreased toward the end of the month. A greater volume of business in tires had been expected. Reclaimers have not been receiving any large orders, but they are looking forward with confidence to a return to pre-war conditions that came to such an abrupt end when the government started its war-time regulations and restrictions. We look forward to considerable exports of reclaimers and scrap before long, and as the number of motor trucks in use is sure to increase phenomenally, the scrap market will profit in proportion to the new demand.

BOOTS AND SHOES—More business continues to be done in boots and shoes than in other lines. A month ago prices ranged from

8½ cents to 9 cents. They are now quoted at 8¾ cents, although many carloads have been sold at 9 cents.

INNER TUBES—There has been little demand, practically no transactions being recorded, change in price fractional.

MECHANICALS—No inquiries at all, situation as stagnant as it could be, prices unchanged.

TIRES—Tire sales have been disappointing. Quotations for mixed remain at 5 cents, same as a month ago. Either no change or fractional change only in other prices.

THE MARKET FOR COTTON AND OTHER FABRICS.

NEW YORK.

A DECLINING market is one where caution is a virtue. Cotton is now over \$80 a bale below the prices of the early part of last September, and everybody is convinced that the tobogganing is far from finished. Labor troubles are spreading in all the textile centers of the United States and Great Britain. Southern stocks are very large and Senators from the cotton-growing states have cabled to President Wilson, asking him to remove all embargoes on the exportation of cotton to non-enemy countries, as well as to permit exports to Germany and Austria.

EGYPTIAN COTTON.—On January 21 the War Trade Board ended all restrictions on the importations of Egyptian cotton. Import licenses are now issued without requiring the endorsement of the bill of lading to the Textile Alliance, Inc. This is fortunate, as Egyptian cotton imports amounted to only 80,000 bales in 1918, whereas the average annual pre-war importations were 200,000 bales.

SEA ISLAND COTTON.—Information from South Carolina, Georgia, and Florida indicates that the Sea Island cotton crop will be negligible the coming season. The amount of Sea Island gathered this season up to January 16 was 41,080 bales as against 88,869 bales last year during the corresponding period, and 113,359 bales the previous year. The government estimate of

the area planted to Sea Island during the past season is 276,000 acres, as against 316,000 acres the previous season, and it figures on 50,000 acres for the coming season.

DUCKS, DRILLS, AND OSNABURGS.—Demand is fairly strong and stocks are low. Mills have not been able to fill their civilian contracts so far. Prices, however, have fallen. Drills, 38-inch 200-yard, were 30½ cents on December 26; they were 27½ cents on January 25. Enameling duck, 38-inch 200 yard, was 31 cents on December 26; it was 29 cents on January 25.

RAINCOAT FABRICS.—Cotton cloth purchases by the raincoat trade have been very light, due to the anticipation of lower prices. The market has been steadily declining. Bombazine, 64 by 60, water-repellant, was 17 cents on December 26; it was 14½ cents on January 25. Plaids, 60 by 48, were 16½ cents on December 26; they were 13½ on January 25. Surface prints, 60 by 48, were 16½ cents on December 26; they were 14 cents on January 25.

TIRE FABRICS.—Prices have been going off for the last two or three months, and consequently buyers are hesitating. While the large consumers have stocks, the smaller mills have none. The former, in certain cases, have bought in order to support the market, realizing that a continued depression will eventually result in a disadvantageous situation.

(Compiled by J. H. Dyer, Savannah, Ga.)

THE MARKET FOR CHEMICALS AND COMPOUNDING INGREDIENTS.

NEW YORK.

REPORTS from all over the United States indicate that even large manufacturers will be buying to meet current needs for some months to come. The market readjustment from war to peace basis is progressing without involving a general lowering of prices. Manufacturers realize that no radical decline in prices of minerals and chemicals is forthcoming and also are feeling the necessity of buying in anticipation of new business on a pre-war schedule of operation.

There is promise of liberal export trading in lithopone, barytes,

aluminum flake, and zinc oxide as soon as freight space is available and considerable development in trade revival is anticipated during the next three months.

The market for all rubber compounding ingredients has, in general, been very inactive during the last month, although there is evidence of spring activity in certain lines.

ANILINE.—This material is in rather light demand at present cut prices from 27 to 30 cents per pound.

BARYTES.—Shows no change.

BENZOL.—The market is dull at 24 to 28 cents per pound.

CARBON TETRACHLORIDE.—Prices during the past month ranged from 15 to 17 cents with no important demand.

LITHARGE has dropped in price one cent per pound but shows little activity.

WHITE LEAD.—There has been little demand for dry white lead. Manufacturers announced a drop of one cent per pound effective for the period from January 15 to June 30.

WHITING stocks are low as usual.

ZINC OXIDE and LITHOPONE are in fair demand without much change in market conditions, although there is promise of active business to come in both materials.

"BUFLOVAK"

Apparatus has won its commanding position in the Vacuum-Drying of sheet and reclaimed rubber, compounds and other materials through exclusive features in design and construction.

"Buflovak" Vacuum Shelf Dryer

Let us tell you about them.

"Buflovak" Apparatus Includes

Vacuum Shelf, Rotary and Drum Dryers
Vacuum Drying and Impregnating Apparatus
Dry Vacuum Pumps—Condensers
Reclaiming and Dersinizing Apparatus

"Buflovak" Vacuum Rotary Dryer

SUBSCRIPTIONS: \$3.00 per year, \$1.75 for six months, postpaid, for the United States and dependencies and Mexico. To the Dominion of Canada and all other countries, \$3.50 (or equivalent funds) per year, postpaid.

ADVERTISING: Rates will be made known on application.

REMITTANCES: Should always be made by bank draft. Post Office or Express money order on New York, payable to THE INDIA RUBBER PUBLISHING COMPANY. Remittances for foreign subscriptions should be sent by International Postal Order, payable as above.

DISCONTINUANCES: Yearly orders for subscriptions and advertising are regarded as permanent, and after the first twelve months they will be discontinued only at the request of the subscriber or advertiser. Bills are rendered promptly at the beginning of each period, and thereby our patrons have due notice of continuance.

TABLE OF CONTENTS ON LAST PAGE OF READING.**THE LUXURY TAX ON TIRES.**

WILL the passenger automobile ever live down its unwarranted reputation as a pleasure vehicle? Nothing has ever been adduced to refute the statement of Colonel Colt that only ten per cent of the passenger automobiles of the country are used primarily for pleasure purposes, yet House and Senate conferees have agreed to a luxury tax of five per cent on manufacturers' sales of motor vehicles, tires and accessories. The efficiency of modern business indisputably depends to a remarkable degree upon the use of passenger automobiles by executives, superintendents, managers, salesmen and others. The injustice of levying a luxury tax on commercial vehicles requires no argument. It is difficult to understand what logic justifies the assumption that ninety per cent of the users of motor vehicles and tires should pay a luxury tax that properly applies only to the other ten per cent. Cars and tires have ceased to be luxuries.

The plan of our Solons seems to be to tax wealth, thrift, and industry. Why not try another plan? Tax the idle, the lazy, the vicious. Put a head tax on agitators, on aliens, I. W. W.'s and Bolshevists. As to the last three, make it prohibitive, if that is possible, in the light of their ample funds.

WOULD USE NINE MILLION POUNDS OF GUTTA.

PROFESSOR LLEWELLYN PREECE, of the Institute of Electrical Engineers, proposes an elaborate scheme to enable the British Government to possess its own "All-British round-the-world electric girdle." His plan is a cable 30,000 miles long—3,000 miles across British America and 27,000 miles of submarine cables—every terminus of which would be on British territory.

Such an independent system would be of advantage politically as well as commercially, and the veteran scientist strongly recommends this great undertaking even though the present cable systems cover nearly, or quite all the routes suggested.

The manufacture and successful laying of 27,000 miles of submarine cable is an immense undertaking. The professor thinks it should cost not over \$34,000,000, or if the present Pacific cable were utilized, perhaps \$24,000,000. To prove that this estimate is low it is only necessary to consider one item, gutta percha.

Practically all the submarine cables are insulated with this valuable mineral. They vary but moderately in the amount of the gutta per mile. The French cable, Brest to New York, contains 396 pounds per mile; the Vancouver-Fanning cable, 340 pounds; the Mackay-Bennett, 320 pounds. The Pacific cable has less at deep-sea portions than near land and varies from 250 to 400 pounds, with an average of 330 pounds to the mile. Other important cables have 400, 368, 325 and 320 pounds per mile. Taking 330 pounds as a reasonable average, 8,910,000 pounds of gutta percha would be required. The cost at the present market quotations, \$3 per pound, would be more than \$25,000,000, leaving only \$9,000,000 of Professor Preece's estimate for the entire cost of copper wire and sheathing, besides manufacturing costs, laying and installing.

Should this amount, nearly 9,000,000 pounds of gutta percha, be needed, where would it come from? The world's annual production is estimated at 5,000,000 pounds, but this also includes gutta siak which is useless for insulation. There is practically no gutta percha in the market. Nor is there such amount in stock anywhere in the world to-day, except perhaps unextracted in the trees of the Far East.

However, although European manufacturers rely solely on gutta percha for insulating submarine cables, American manufacturers have successfully utilized rubber for this purpose, and while the longest stretch of such cable is only about 800 miles, it has withstood Arctic cold over land and under water as well as any gutta-protected one. In some short cables it is also claimed that rubber properly applied on tin-coated copper conductors has proved better than gutta percha in tropical waters infested with the Teredo.

Should the British Government adopt Professor Preece's plan, it is more than likely that the manufacturers of that nine thousand leagues of cable under the

sea would be obliged to insulate with rubber or wait many years and pay a larger price than the Professor estimates.

ANTIDOTES FOR BOLSHEVISM.
